Fields

Field	Function
31-18 —	Reserved
17 VFFQ	VLAN Tag Filter Fail Packets Queue Holds the receive queue number to which the tagged packets failing the destination or source address filter (and UFFQE and MFFQE not being 1) or failing the VLAN tag filter must be routed to. This field is valid only when the VFFQE field = 1.
16 VFFQE	VLAN Tag Filter Fail Packets Queuing Enable Indicates whether VLAN tag filter fail packet queuing is enabled or disabled. • If this field is 1, the tagged packets that fail the destination or source address filter or fail the VLAN tag filter are routed to the receive queue number programmed using the VFFQ field. • If this field is 0, the tagged packets that fail the destination or source address filter or fail the VLAN tag filter are routed based on the other routing options. This field is valid only when MAC_Packet_Filter[RA] = 1. 0b - Disabled 1b - Enabled
15-10 —	Reserved
9 MFFQ	Multicast Address Filter Fail Packets Queue Holds the receive queue number to which the multicast packets failing the destination or source address filter are routed to. This field is valid only when the MFFQE field = 1.
8 MFFQE	Multicast Address Filter Fail Packets Queuing Enable Indicates whether multicast address filter fail packet queuing is enabled or disabled. • If this field is 1, the multicast packets that fail the destination or source address filter are routed to the receive queue number programmed using the MFFQ field. • If this field is 0, the multicast packets that fail the destination or source address filter are routed based on the other routing options. This field is valid only when MAC_Packet_Filter[RA] = 1. 0b - Disabled 1b - Enabled
7-2 —	Reserved
1 UFFQ	Unicast Address Filter Fail Packets Queue Holds the receive queue number to which the unicast packets failing the destination or source address filter are routed to. This field is valid only when the UFFQE field = 1.

Table continues on the next page...

Table continued from the previous page...

Field	Function
0 UFFQE	Unicast Address Filter Fail Packets Queuing Enable Indicates whether unicast address filter fail packet queuing is enabled or disabled. • When the value of this field is 1, the unicast packets that fail the destination or source address filter are routed to the receive queue number programmed using the UFFQ field. • If this field is 0, the unicast packets that fail the destination or source address filter are routed based on the other routing options. This field is valid only when MAC_Packet_Filter[RA] = 1. 0b - Disabled 1b - Enabled

78.17.29 MAC RxQ Control 0 (MAC_RxQ_Ctrl0)

Offset

Register	Offset
MAC_RxQ_Ctrl0	A0h

Function

Controls queue management in the MAC receiver.

NOTE

In multiple receive queues configuration, all the queues are disabled by default. Enable the receive queue by programming the corresponding field in this register.

9-8 —	Reserved
7-6 —	Reserved
5-4 —	Reserved
3-2 RXQ1EN	Receive Queue 1 Enable Performs in a manner similar to the RXQ0EN field and indicates if receive queue 1 is enabled for AV or DCB. 00b - Queue not enabled 01b - Queue enabled for AV 10b - Queue enabled for DCB/generic 11b - Reserved
1-0 RXQ0EN	Receive Queue 0 Enable Indicates whether receive queue 0 is enabled for AV or DCB. 00b - Queue not enabled 01b - Queue enabled for AV 10b - Queue enabled for DCB/generic 11b - Reserved

78.17.30 Receive Queue Control 1 (MAC_RxQ_Ctrl1)

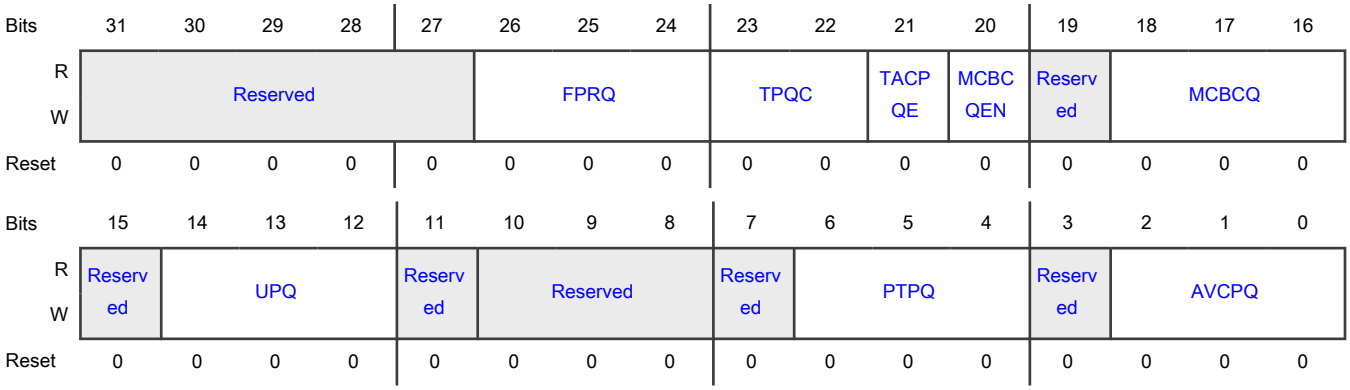
Offset

Register	Offset
MAC_RxQ_Ctrl1	A4h

Function

Controls the routing of multicast, broadcast, AV, DCB, and untagged packets to the receive queues.

Diagram



Fields

Field	Function
31-27 —	Reserved
26-24 FPRQ	Frame Preemption Residue Queue Holds the receive queue number to which the residual preemption frames must be forwarded. Preemption frames that are tagged and pass the SA, DA, or VLAN filtering are routed based on the settings of the PSRQ fields in MAC RxQ Control 2 (MAC_RxQ_Ctrl2). All other frames are treated as residual frames and are routed to the queue number mentioned in this field. Queue 0 is used as the default queue for express frames, so you cannot write 0 to this field.
23-22 TPQC	Tagged PTP Over Ethernet Packets Queuing Control Controls the routing of the VLAN-tagged PTPoE packets. These are the allowed programmable options: • 2'b00: VLAN-tagged PTPoE packets are routed as generic VLAN-tagged packets (based on the PSRQ fields in MAC RxQ Control 2 (MAC_RxQ_Ctrl2) for only non-AV enabled receive queues). • 2'b01: VLAN-tagged PTPoE packets are routed to the receive queue that the PTPQ field of this register specifies (this Rx queue can be enabled for AV or non-AV traffic).

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• 2'b10: VLAN-tagged PTPoE packets are routed to only AV-enabled receive queues based on the settings of the PSRQ fields.
21 TACPQE	Tagged AV Control Packets Queuing Enable Indicates the status of tagged AV control packet queuing. • If this field is 1, MAC routes the received tagged AV control packets to the receive queue that the AVCPQ field specifies. • If this field is 0, MAC routes the received tagged AV control packets based on the tag priority matching the PSRQ fields in MAC RxQ Control 2 (MAC_RxQ_Ctrl2). 0b - Disabled 1b - Enabled
20 MCBCQEN	Multicast And Broadcast Queue Enable Specifies whether multicast or broadcast packet routing to the receive queue is enabled or disabled. The multicast or broadcast packets must be routed to the receive queue specified in the MCBCQ field. 0b - Disabled 1b - Enabled
19 —	Reserved
18-16 MCBCQ	Multicast And Broadcast Queue Specifies the receive queue onto which multicast or broadcast packets are routed. Any receive queue enabled for Generic, DCB, or AV traffic can be used to route the multicast or broadcast packets. 000b - Receive queue 0 001b - Receive queue 1 010b - Receive queue 2 011b - Receive queue 3 100b - Receive queue 4 101b - Receive queue 5 110b - Receive queue 6 111b - Receive queue 7
15 —	Reserved
14-12 UPQ	Untagged Packet Queue Indicates the receive queue to which the untagged packets need to be routed. Any receive queue enabled for generic, DCB, or AV traffic can be used to route the untagged packets.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	000b - Receive queue 0 001b - Receive queue 1 010b - Receive queue 2 011b - Receive queue 3 100b - Receive queue 4 101b - Receive queue 5 110b - Receive queue 6 111b - Receive queue 7
11 —	Reserved
10-8 —	Reserved
7 —	Reserved
6-4 PTPQ	PTP Packets Queue Specifies the receive queue on which the PTP packets sent over the Ethernet payload (not over IPv4 or IPv6) are routed. When MAC_Timestamp_Control[AV8021ASMEN] = 1, only untagged PTP over Ethernet packets are routed to a receive queue. If this field is not 1, then based on the settings of the TPQC field, both tagged and untagged PTPoE packets can be routed to this receive queue. 000b - Receive queue 0 001b - Receive queue 1 010b - Receive queue 2 011b - Receive queue 3 100b - Receive queue 4 101b - Receive queue 5 110b - Receive queue 6 111b - Receive queue 7
3 —	Reserved
2-0 AVCPQ	AV Untagged Control Packets Queue Specifies the receive queue on which the received AV tagged and untagged control packets are routed.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	The AV tagged (when the TACPQE field = 1) and untagged control packets are routed to the receive queue that this field specifies. 000b - Receive queue 0 001b - Receive queue 1 010b - Receive queue 2 011b - Receive queue 3 100b - Receive queue 4 101b - Receive queue 5 110b - Receive queue 6 111b - Receive queue 7

78.17.31 MAC RxQ Control 2 (MAC_RxQ_Ctrl2)

Offset

Register	Offset
MAC_RxQ_Ctrl2	A8h

Function

Controls the routing of tagged packets based on the settings of MAC_Ext_Configuration[USP] for packets received in receive queues 0-3.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
23-16 —	Reserved
15-8 PSRQ1	Priorities Selected In Receive Queue 1 Determines the priorities assigned to receive queue 1. All the packets with priorities that match the values defined in this field are routed to receive queue 1. For example, if PSRQ1[4] = 1, packets with MAC_Ext_Configuration[USP] equal to 4 are routed to receive queue 1. You must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues. This means that the same priority is not mapped to multiple receive queues.
7-0 PSRQ0	Priorities Selected In Receive Queue 0 Determines the priorities assigned to receive queue 0. All the packets with priorities that match the values defined in this field are routed to receive queue 0. For example, if PSRQ0[5] = 1, packets with MAC_Ext_Configuration[USP] equal to 5 are routed to receive queue 0. You must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues. This means that the same priority is not mapped to multiple receive queues.

78.17.32 MAC Interrupt Status (MAC_Interrupt_Status)

Offset

Register	Offset
MAC_Interrupt_Status	B0h

Function

Contains the status of interrupts.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-21 —	Reserved
20 MFRIS	MMC FPE Receive Interrupt Status Indicates the status of MMC FPE receive interrupt. This field becomes 1 when any of the fields in MMC Receive Packet Assembly Error Counter Interrupt Status (MMC_FPE_Rx_Interrupt) is 1. The field becomes 0 when all the other fields in MMC Receive Packet Assembly Error Counter Interrupt Status (MMC_FPE_Rx_Interrupt) become 0 too. 0b - Inactive 1b - Active
19 MFTIS	MMC FPE Transmit Interrupt Status Indicates the status of MMC FPE transmit interrupt. This field becomes 1 when an interrupt generates in MMC Transmit FPE Fragment Counter Interrupt Status (MMC_FPE_Tx_Interrupt). The field becomes 0 when all the other fields in this register become 0 too. This field is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support. 0b - Inactive 1b - Active
18 MDIOIS	MDIO Interrupt Status Indicates the status of an interrupt event after the completion of an MDIO operation. To reset this field, you must read this field or write 1 to it when MAC_CSR_SW_Ctrl[RCWE] = 1. Access restrictions apply to this field. It clears on a read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. The field automatically becomes 1 on an internal event. 0b - Inactive 1b - Active
17 FPEIS	Frame Preemption Interrupt Status Indicates the status of an interrupt event during the frame preemption operation (the value of RVER, RRSP, TVER, and TRSP fields of MAC FPE Control STS (MAC_FPE_CTRL_STS) = 1). To reset this field, you must clear the event in MAC FPE Control STS (MAC_FPE_CTRL_STS) that caused the interrupt. 0b - Inactive 1b - Active
16 —	Reserved
15	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
14 RXSTSIS	Receive Status Interrupt Indicates the status of received packets. This field becomes 1 when MAC_Rx_Tx_Status[RWT] = 1. The field becomes 0 when you read the corresponding interrupt source field in MAC Rx Transmit Status (MAC_Rx_Tx_Status), or if you write to this interrupt source field when MAC_CSR_SW_Ctrl[RCWE] = 1. The field becomes 0 in either of these circumstances: • You read the corresponding interrupt-source field in MAC Rx Transmit Status (MAC_Rx_Tx_Status). • You write 1 to the corresponding interrupt-source field in MAC Rx Transmit Status (MAC_Rx_Tx_Status) when MAC_CSR_SW_Ctrl[RCWE] = 1. 0b - Inactive 1b - Active
13 TXSTSIS	Transmit Status Interrupt Indicates the status of transmitted packets. This field becomes 1 when any of the following fields is 1 in MAC Rx Transmit Status (MAC_Rx_Tx_Status): • Excessive collision (EXCOL) • Late collision (LCOL) • Excessive deferral (EXDEF) • Loss of carrier (LCARR) • No carrier (NCARR) • Jabber timeout (TJT) This field becomes 0 in either of these circumstances: • You read the corresponding interrupt-source field in MAC Rx Transmit Status (MAC_Rx_Tx_Status). • You write 1 to the corresponding interrupt-source field in MAC Rx Transmit Status (MAC_Rx_Tx_Status) when MAC_CSR_SW_Ctrl[RCWE] = 1. 0b - Inactive 1b - Active
12 TSIS	Timestamp Interrupt Status Indicates the status of timestamp interrupt. If the timestamp feature is enabled, this field becomes 1 when any of the following conditions is true: • The system time value is equal to or exceeds the value specified in MAC PPS1 Target Time In Seconds (MAC_PPS1_Target_Time_Seconds) and MAC PPS1 Target Time In Nanoseconds (MAC_PPS1_Target_Time_Nanoseconds). • There is an overflow in MAC System Time In Seconds (MAC_System_Time_Seconds).

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• The target time error occurred, which means, the programmed target time already elapsed. In configurations other than EQOS_CORE, when the drop transmit status is enabled in MTL, this field becomes 1 when the captured transmit timestamp is updated in MAC Transmit Timestamp Status In Nanoseconds (MAC_Tx_Timestamp_Status_Nanoseconds) and MAC Transmit Timestamp Status In Seconds (MAC_Tx_Timestamp_Status_Seconds). The field becomes 0 in either of these circumstances: • You read the corresponding interrupt-source field in MAC Rx Transmit Status (MAC_Rx_Tx_Status). • You write 1 to the corresponding interrupt-source field in MAC Rx Transmit Status (MAC_Rx_Tx_Status) when MAC_CSR_SW_Ctrl[RCWE] = 1. 0b - Inactive 1b - Active
11 —	Reserved
10 MMCTXIS	MMC Transmit Interrupt Status Indicates the status of MMC transmit interrupt. This field: • Becomes 1 when any field in MMC Transmit Interrupt (MMC_Tx_Interrupt) becomes 1. • Becomes 0 when all the fields in MMC Transmit Interrupt (MMC_Tx_Interrupt)return to 0. This field is valid only when you select the Enable MAC Management Counters (MMC) option. 0b - Inactive 1b - Active
9 MMCRXIS	MMC Receive Interrupt Status Indicates the status of MMC receive interrupt. This field: • Becomes 1 when any field in MMC Receive Interrupt (MMC_Rx_Interrupt) becomes 1. • Becomes 0 when all the fields in MMC Receive Interrupt (MMC_Rx_Interrupt)return to 0. This field is valid only when you select the Enable MAC Management Counters (MMC) option. 0b - Inactive 1b - Active
8 MMCIS	MMC Interrupt Status Indicates the status of MMC interrupt. This field becomes 1 when MMCRXIS = MMCTXIS = 1, and the field becomes 0 only when MMCRXIS = MMCTXIS = 0. MMCIS is valid only when you select the Enable MAC Management Counters (MMC) option.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Inactive 1b - Active
7-6 —	Reserved
5 —	Reserved
4 —	Reserved
3 PHYIS	PHY Interrupt Indicates whether the PHY interrupt is detected. This field becomes 1 when rising edge is detected on the phy_intr_i input signal. The field becomes 0 when you read this register (or if you write 1 to this field when MAC_CSR_SW_Ctrl[RCWE] = 1). 0b - Not detected 1b - Detected
2 —	Reserved
1 —	Reserved
0 —	Reserved

78.17.33 MAC Interrupt Enable (MAC_Interrupt_Enable)

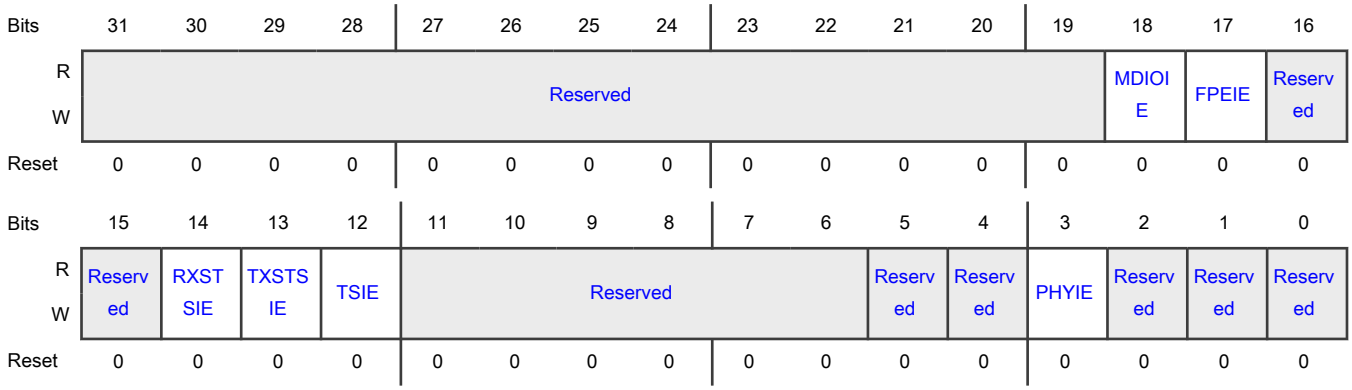
Offset

Register	Offset
MAC_Interrupt_Enable	B4h

Function

Contains masks for generating MAC interrupts.

Diagram



Fields

Field	Function
31-19 —	Reserved
18 MDIOIE	MDIO Interrupt Enable Indicates whether the MDIO interrupt is enabled or disabled. If this field is 1, it enables the assertion of the interrupt when MAC_Interrupt_Status[MDIOIS] = 1. 0b - Disabled 1b - Enabled
17 FPEIE	Frame Preemption Interrupt Enable Indicates whether the frame preemption interrupt is enabled or disabled. If this field is 1, it enables the assertion of the interrupt when MAC_Interrupt_Status[FPEIS] = 1. 0b - Disabled 1b - Enabled
16 —	Reserved
15 —	Reserved
14 RXSTSIE	Receive Status Interrupt Enable Indicates whether the receive status interrupt is enabled or disabled. If this field is 1, it enables the assertion of the interrupt signal because of the setting of MAC_Interrupt_Status[RXSTSIS]. 0b - Disabled 1b - Enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
13 TXSTSIE	Transmit Status Interrupt Enable Indicates whether the timestamp status interrupt is enabled or disabled. If this field is 1, it enables the assertion of the interrupt signal because of the setting of MAC_Interrupt_Status[TXSTSIS]. 0b - Disabled 1b - Enabled
12 TSIE	Timestamp Interrupt Enable Indicates whether the timestamp interrupt is enabled or disabled. If this field is 1, it enables the assertion of the interrupt signal because of the setting MAC_Interrupt_Status[TSIS]. 0b - Disabled 1b - Enabled
11-6 —	Reserved
5 —	Reserved
4 —	Reserved
3 PHYIE	PHY Interrupt Enable Indicates whether the assertion of the interrupt signal is enabled or disabled. If this field is 1, it enables the assertion of the interrupt signal because of the setting of MAC_Interrupt_Status[PHYIS]. 0b - Disabled 1b - Enabled

1 —	Reserved
0 —	Reserved

78.17.34 MAC Rx Transmit Status (MAC_Rx_Tx_Status)

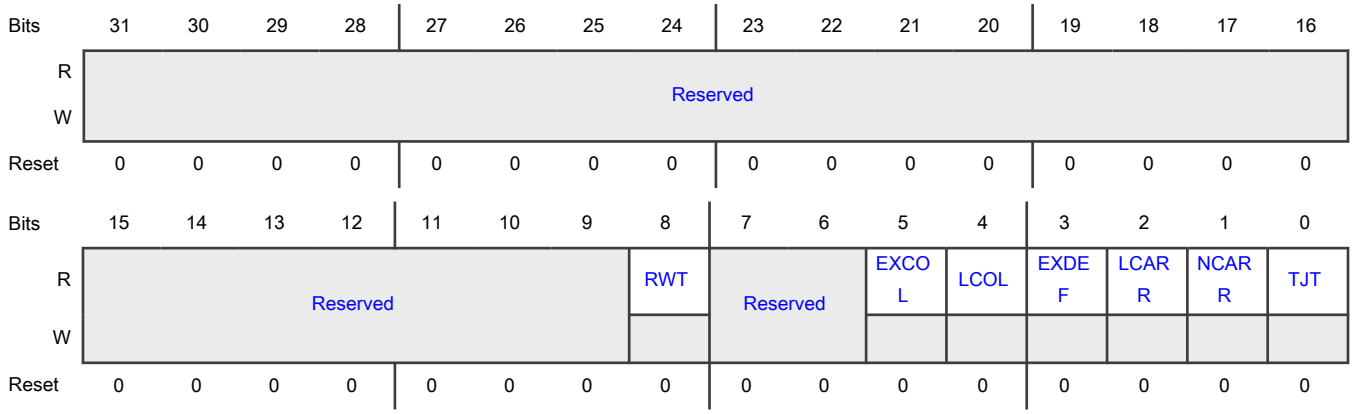
Offset

Register	Offset
MAC_Rx_Tx_Status	B8h

Function

Contains the receive and transmit error status.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 RWT	Receive Watchdog Timeout Indicates the status of receive watchdog. This field becomes 1 when a packet with a length greater than 2,048 bytes is received (10,240 bytes when Jumbo Packet mode is enabled) and MAC_Configuration[WD] = 0. RWT becomes 1 when a packet with length greater than 16,383 bytes is received and MAC_Configuration[WD] = 1. Access restrictions apply to RWT. It becomes 0 on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. RWT automatically becomes 1 on an internal event occurrence. 0b - No receive watchdog timed out 1b - Receive watchdog timed out
7-6 —	Reserved
5	Excessive Collisions

Table continues on the next page...

Table continued from the previous page...

Field	Function
EXCOL	Indicates the status of excessive collision. If MTL_Operation_Mode[DTXSTS] = 1, this field, EXCOL, indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If MAC_Configuration[DR] = 1, EXCOL becomes 1 after the first collision and the packet transmission is aborted. Access restrictions apply to EXCOL. It becomes 0 on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. EXCOL automatically becomes 1 on an internal event occurrence. 0b - No collision 1b - Excessive collision is sensed
4 LCOL	Late Collision Indicates the status of late collision. If MTL_Operation_Mode[DTXSTS] = 1, this field, LCOL, indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including preamble in MII mode; 512 bytes including preamble and carrier extension in GMII mode). This field is invalid if an underflow error occurs. Access restrictions apply to LCOL. It becomes 0 on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. LCOL automatically becomes 1 on an internal event occurrence. 0b - No collision 1b - Late collision is sensed
3 EXDEF	Excessive Deferral Indicates whether the transmission ended because of excessive deferral. If MTL_Operation_Mode[DTXSTS] = 1 and MAC_Configuration[DC] = 1 too, this field, EXDEF, indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000/2500 Mbit/s mode or when the jumbo packet is enabled). Access restrictions apply to EXDEF. It becomes 0 on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. EXDEF automatically becomes 1 on an internal event occurrence. 0b - No excessive deferral 1b - Excessive deferral
2 LCARR	Loss of Carrier Indicates the status of carrier signal. If MTL_Operation_Mode[DTXSTS] = 1, this field, LCARR, indicates that the loss of carrier occurred during packet transmission, which means, the phy_crs_i signal was inactive for one or more transmission clock periods during packet transmission. The field is valid only for packets transmitted without collision. Access restrictions apply to LCARR. It becomes 0 on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. LCARR automatically becomes 1 on an internal event occurrence. 0b - Carrier is present

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Loss of carrier
1 NCARR	No Carrier Indicates whether the carrier signal is present from the PHY at the end of preamble transmission. If MTL_Operation_Mode[DTXSTS] = 1, NCARR indicates that the carrier signal from the PHY is absent at the end of preamble transmission. Access restrictions apply to NCARR. It becomes 0 after either of these actions: • You read NCARR. • You write 1 to NCARR when MAC_CSR_SW_Ctrl[RCWE] = 1. NCARR automatically becomes 1 after an internal event occurs. 0b - Present 1b - Absent
0 TJT	Transmit Jabber Timeout Indicates whether a transmit-jabber timer timeout occurred. The timeout occurs after any of these events: • MAC_Configuration[JD] = 0 and the normal packet size exceeds 2,048 bytes. • MAC_Configuration[JD] = 0 and the jumbo packet size exceeds 10240 bytes. • MAC_Configuration[JD] = 1 and the normal packet size exceeds 16383 bytes. Access restrictions apply to TJT. It becomes 0 after either of these actions: • You read TJT. • You write 1 to TJT when MAC_CSR_SW_Ctrl[RCWE] = 1. TJT automatically becomes 1 after an internal event occurs. 0b - No transmit jabber timeout occurred 1b - Transmit jabber timeout occurred

78.17.35 MAC Version (MAC_Version)

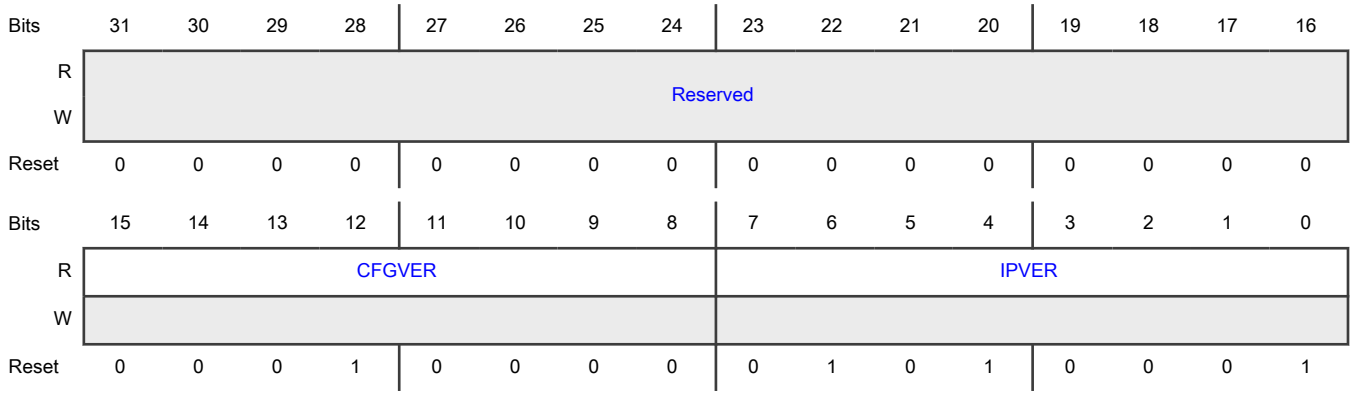
Offset

Register	Offset
MAC_Version	110h

Function

Identifies the version of the module.

Diagram



Fields

Field	Function

15-8 CFGVER	IP Configuration Version
7-0 IPVER	IP Version

78.17.36 MAC Debug (MAC_Debug)

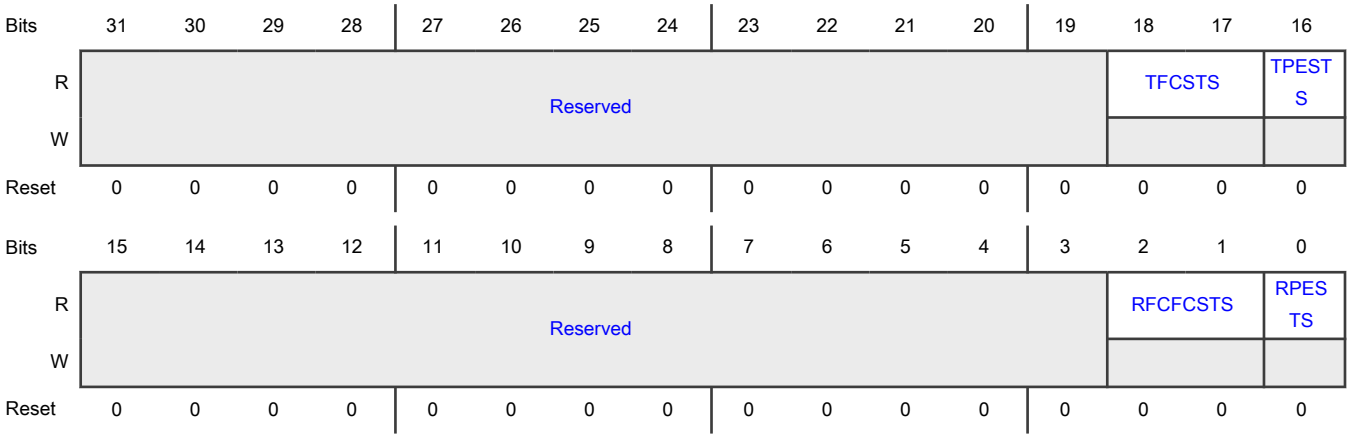
Offset

Register	Offset
MAC_Debug	114h

Function

Provides the debug status of the various MAC blocks.

Diagram



Fields

Field	Function
31-19 —	Reserved
18-17 TFCSTS	MAC Transmit Packet Controller Status Indicates the state of the MAC transmit packet controller module. 00b - Idle state 01b - Waiting for one of these: status of the previous packet or IPG, or for the back-off period to be over 10b - Generating and transmitting a pause control packet (in Full-Duplex mode) 11b - Transferring input packet for transmission
16 TPESTS	MAC GMII Or MII Transmit Protocol Engine Status Indicates whether MAC GMII or MII transmit protocol engine is detected. If this field is 1, it indicates that the MAC GMII or MII transmit protocol engine is actively transmitting data and is not in an idle state. 0b - Not detected 1b - Detected
15-3 —	Reserved
2-1 RFCFCSTS	MAC Receive Packet Controller FIFO Status Indicates the status of the small FIFO read and write controllers of the MAC receive packet controller module. If this field is 1, it indicates that the small FIFO read and write controllers of the MAC receive packet controller module are in an active state.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	00b - Inactive 01b - Active
0 RPESTS	Receive Protocol Engine Status Indicates whether MAC GMII or MII receive protocol engine is detected. If this field is 1, it indicates that the MAC GMII or MII receive protocol engine is actively receiving data and is not in an idle state. 0b - Not detected 1b - Detected

78.17.37 MAC Hardware Feature 0 (MAC_HW_Feature0)

Offset

Register	Offset
MAC_HW_Feature0	11Ch

Function

Indicates the presence of the first set of EMAC optional features or functions. You can use this register to dynamically enable or disable the programs related to these features.

Field	Function
—	
30-28 ACTPHYSEL	Active PHY Feature Indicates the selected active PHY interface. If you have multiple PHY interfaces (GMII, MII, RevMII, RGMII, RMII, RTBI, SGMII, SGMII, or TBI) in your configuration, this field indicates the sampled value of the phy_intf_sel_i signal during reset deassertion. 000b - GMII or MII 001b - RGMII 010b - SGMII 011b - TBI 100b - RMII 101b - RTBI 110b - SMII 111b - RevMII
27 SAVLANINS	SA or VLAN Insertion Feature Indicates whether the feature that enables SA or VLAN insertion on transmit is selected. This field becomes 1 if you select the "enable SA and VLAN insertion on Tx" option. 0b - Not selected 1b - Selected
26-25 TSSTSSEL	Timestamp System Time Source Feature Indicates the source of the timestamp system time. This field becomes 1 if you select the "enable IEEE 1588 timestamp support" option. 00b - Internal 01b - External 10b - Both internal and external 11b - Reserved
24 MACADR64SEL	MAC Addresses 64-127 Indicates whether the feature that enables additional 64 MAC address registers (64-127) is selected. This field becomes 1 if you enable the "MAC addresses (64-127) select" option. 0b - Not selected 1b - Selected
23	MAC Addresses 32-63 Indicates whether the feature that enables additional 32 MAC address registers (32-63) is selected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
MACADR32SEL	This field becomes 1 if you select the "MAC addresses 32-63 select" option. 0b - Not selected 1b - Selected
22-18 ADDMACADRSEL	MAC Addresses 1-31 Indicates whether the feature that enables additional 1-31 MAC address registers is selected. This field becomes 1 if you select a non-zero value for enabling the "MAC addresses 1-31 select" option. 0_0000b - Not selected 0_0001b - Selected
17 —	Reserved
16 RXCOESEL	Receive Checksum Offload Feature Indicates whether the feature that enables receive TCP/IP checksum offload is selected. This field becomes 1 if you select the "enable receive TCP/IP checksum check" option. 0b - Not selected 1b - Selected
15 —	Reserved
14 TXCOESEL	Transmit Checksum Offload Feature Indicates whether the feature that enables transmit TCP/IP checksum insertion is selected. This field becomes 1 if you select the "enable transmit TCP/IP checksum insertion" option. 0b - Not selected 1b - Selected
13 EEESEL	Energy Efficient Ethernet (EEE) Feature Indicates whether the feature that enables EEE is selected. This field becomes 1 if you select the "enable EEE" option. 0b - Not selected 1b - Selected
12 TSSEL	IEEE 1588-2008 Timestamp Feature Indicates whether the option that enables IEEE 1588-2008 timestamp is selected. This field becomes 1 if you select the "enable IEEE 1588 timestamp support" option. 0b - Not selected

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Selected
11-10 —	Reserved
9 ARPOFFSEL	ARP Offload Feature Indicates whether the feature that enables ARP offload is selected. This field becomes 1 if you select the "enable IPv4 ARP offload" option. 0b - Not selected 1b - Selected
8 MMCSEL	MAC Management Counters (MMC) Feature Indicates whether the feature that enables MMC is selected. This field becomes 1 if you select the "enable MMC" option. 0b - Not selected 1b - Selected
7 MGKSEL	PMT Magic Packet Feature Indicates whether the feature that enables PMT magic detection is selected. This field becomes 1 if you select the "enable magic packet detection" option. 0b - Not selected 1b - Selected
6 RWKSEL	PMT Remote Wake-Up Packet Feature Indicates whether the feature that enables PMT remote wake-up packet detection is selected. This field becomes 1 if you select the "enable remote wake-up packet detection" option. 0b - Not selected 1b - Selected
5 SMASEL	SMA (MDIO) Interface Feature Indicates whether the feature that enables station management (MDIO interface) is selected. This field becomes 1 if you select the "enable station management (MDIO interface)" option. 0b - Not selected 1b - Selected
4 VLHASH	VLAN Hash Filter Feature Indicates whether the filtering option based on VLAN hash table is selected. This field becomes 1 if you select the "enable VLAN hash table based filtering" option.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Not selected 1b - Selected
3 PCSSEL	PCS Select Indicates if either of the TBI, SGMII, or RTBI PHY interface options is selected. This field becomes 1 if you select any one of the TBI, SGMII, or RTBI PHY interface options. 0b - No 1b - Yes
2 HDSEL	Half-Duplex Support Feature Indicates whether half-duplex support is available as the mode of operation. This field becomes 1 if you select Half-Duplex as the mode of operation. 0b - Unavailable 1b - Available
1 GMIISEL	1000 Mbit/s Support Feature Indicates whether 1000 Mbit/s support is available as the mode of operation. This field becomes 1 if you select 1000 Mbit/s as the mode of operation. 0b - Unavailable 1b - Available
0 MIISEL	10 or 100 Mbit/s Support Feature Indicates whether 10 or 100 Mbit/s support is available as the mode of operation. This field becomes 1 if you select 10/100 Mbit/s as the mode of operation. 0b - Unavailable 1b - Available

78.17.38 MAC Hardware Feature 1 (MAC_HW_Feature1)

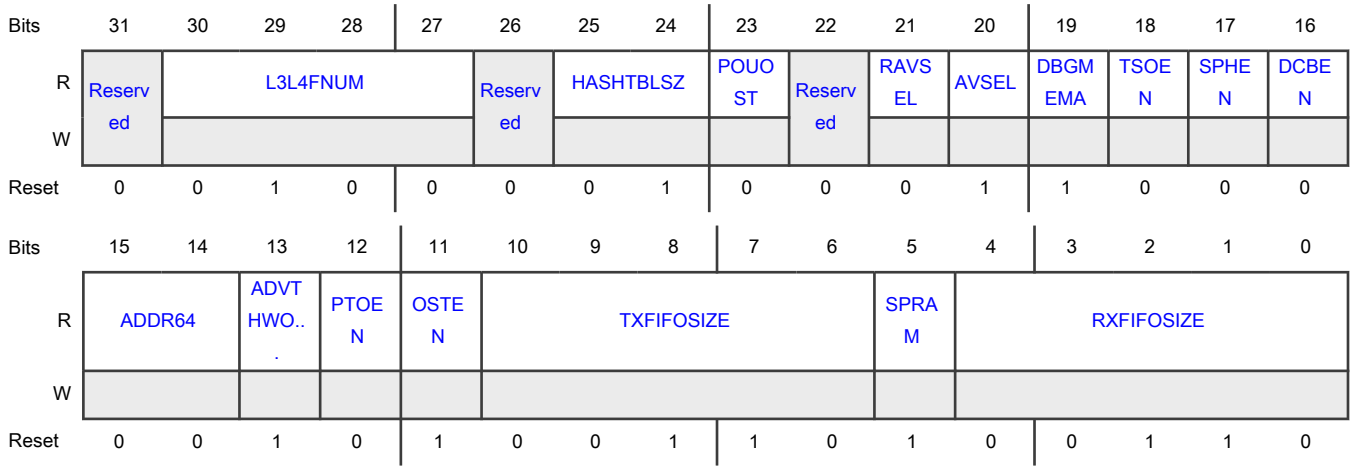
Offset

Register	Offset
MAC_HW_Feature1	120h

Function

Indicates the presence of the second set of optional features or functions of the module. You can use this register to dynamically enable or disable the programs related to these features.

Diagram



Fields

Field	Function
31 —	Reserved
30-27 L3L4FNUM	L3 Or L4 Filter Number Indicates the total number of L3 or L4 filters. 0000b - No filters (0) 0001b - 1 0010b - 2 0011b - 3 0100b - 4 0101b - 5 0110b - 6 0111b - 7 1000b - 8
26 —	Reserved
25-24 HASHTBLSZ	Hash Table Size Indicates the size of the hash table. 00b - No hash table 01b - 64 10b - 128 11b - 256

Table continues on the next page...

Table continued from the previous page...

Field	Function
23 POUOST	One Step For PTP Over UDP/IP Feature Indicates whether the feature that enables one step for PTP over UDP/IP is selected. This field becomes 1 if you select the "enable one-step timestamp for PTP over UDP/IP" option. 0b - Not selected 1b - Selected
22 —	Reserved
21 RAVSEL	Receive Side-Only AV Feature Indicates whether the feature that enables audio-video bridging only on the receive side is selected. This field becomes 1 if you select the "enable audio-video bridging on receive side only" option. 0b - Not selected 1b - Selected
20 AVSEL	AV Feature Indicates whether the feature that enables audio-video bridging is selected. This field becomes 1 if you select the "enable audio video bridging" option. 0b - Not selected 1b - Selected
19 DBGMEMA	DMA Debug Registers Enable Feature Indicates whether the feature that enables DMA debug registers is selected. This field becomes 1 if you select the "enable DMA debug mode" option. 0b - Not selected 1b - Selected
18 TSOEN	TCP Segmentation Offload Enable Feature Indicates whether the feature that enables TCP segmentation offload for TCP/IP packets is selected. This field becomes 1 if you select the "enable TCP segmentation offloading for TCP/IP packets" option. 0b - Not selected 1b - Selected
17 SPHEN	Split Header Enable Feature Indicates whether the feature that enables a split header structure is selected. This field becomes 1 if you select the "enable split header structure" option. 0b - Not selected

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Selected
16 DCBEN	DCB Enable Feature Indicates whether the feature that enables data center bridging is selected. This field becomes 1 if you select the "enable data center bridging" option. 0b - Not selected 1b - Selected
15-14 ADDR64	Address Width Feature Indicates the configured address width. 00b - 32 01b - 40 10b - 48 11b - Reserved
13 ADVTHWORD	IEEE 1588 High-Word Feature Indicates whether the feature that enables the IEEE 1588 high-word register is selected. This field becomes 1 if you select the "enable/add IEEE 1588 higher-word register" option. 0b - Not selected 1b - Selected
12 PTOEN	PTP Offload Enable Feature Indicates whether the feature that enables PTP offload is selected. This field becomes 1 if you select the "enable PTP timestamp offload" option. 0b - Not selected 1b - Selected
11 OSTEN	One-Step Timestamping Enable Feature Indicates whether the feature that enables one-step timestamping is selected. This field becomes 1 if you select the "enable one-step timestamp" option. 0b - Not selected 1b - Selected
10-6 TXFIFOSIZE	MTL Transmit FIFO Size Feature Contains the configured value of MTL transmit FIFO (in bytes) expressed as log to base 2 minus 7, which means, Log 2 (TXFIFO_SIZE) - 7. 0_0000b - 128 bytes

Table continues on the next page...

Table continued from the previous page...

Field	Function

Fields

Field	Function
31-28 —	Reserved
27 PSE	Preamble Suppression Enable Indicates the status of preamble suppression. • If this field is 1, SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. • If this field is 0, the MDIO frame always includes 32 bits of preamble as defined in the IEEE specification.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
26 BTB	Back-To-Back Transactions Indicates the status of back-to-back transactions. When BTB = 1 and NTC > 0, MAC indicates the completion of a read or write command at the end of a frame transfer (before the trailing clocks are transmitted). Therefore, you can initiate the next command, and that command executes immediately irrespective of the number of trailing clocks generated for the previous frame. When BTB = 0, the read or write command completes (GB = 0) only after the trailing clocks generate. In this mode, you must ensure that: • NTC is always generated after each frame. • BTB must not be equal to 1 when NTC = 0. 0b - Disabled 1b - Enabled
25-21 PA	Physical Layer Address Indicates whether MAC accesses clause 22 PHY devices (out of 32) or clause 45 capable PHYs (out of 32).
20-16 RDA	Register Or Device Address Indicates whether MAC accesses clause 22 PHY devices (out of 32) or clause 45 capable PHYs (out of 32).
15 —	Reserved
14-12 NTC	Number Of Trailing Clocks Controls the number of trailing clock cycles generated on the gmii_mdc_o (MDC) signal after the end of MDIO frame transmission. The valid values can range from 0 to 7. Writing 3h to this field indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.
11-8 CR	CSR Clock Range Determines the frequency of the MDC clock according to the CSR clock frequencies used in your design: • 0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 • 0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 • 0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 • 0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 • 0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 • 0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• 0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 • 0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 When bit 3 of this field is 0, the suggested CSR clock-frequency range applicable to each value ensures that the MDC clock frequency is approximately between 1.0 MHz and 2.5 MHz. When bit 3 of this field is 1, you can achieve a higher MDC clock frequency than the IEEE 802.3 frequency limit of 2.5 MHz, and program a clock divider of a lower value. For example, if the CSR clock frequency is 100 MHz and you write 1010 to this field, the resultant MDC clock frequency equals 12.5 MHz, which is above the range specified in IEEE 802.3. Program these values only if the interfacing chips support faster MDC clocks: • 1000: CSR clock/4 • 1001: CSR clock/6 • 1010: CSR clock/8 • 1011: CSR clock/10 • 1100: CSR clock/12 • 1101: CSR clock/14 • 1110: CSR clock/16 • 1111: CSR clock/18 These bits are not used for accessing RevMII. They are read-only if the RevMII interface is selected as a single PHY interface.
7-5 —	Reserved
4 SKAP	Skip Address Packet Indicates the status of the skip address packet. If this field is 1, SMA does not send the address packets before read, write, or post-read increment address packets. This field is valid only when C45E = 1. 0b - Disabled 1b - Enabled
3 GOC_1	GMII Operation Command 1 Indicates the status of GMII operation command 1. GMII operation command 1 represents the higher bit of the operation command to PHY or RevMII. The fields GOC_1 and GOC_O indicate these values: • 00: Reserved • 01: Write • 10: Post-read increment address for clause 45 PHY • 11: Read

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When clause 22 PHY or RevMII is enabled, only write and read commands are valid. 0b - Disabled 1b - Enabled
2 GOC_0	GMII Operation Command 0 Indicates the status of GMII operation command 0. GMII operation command 0 represents the lower bit of the operation command to PHY or RevMII. When in SMA mode (MDIO master), this field, along with the GOC_1 field, determines the operation to be performed to PHY. This field is read-only and tied to 1 when only RevMII is selected in configuration. 0b - Disabled 1b - Enabled
1 C45E	Clause 45 PHY Enable Indicates the status of clause 45 PHY. • If this field is 1, clause 45 capable PHY is connected to MDIO. • If this field is 0, clause 22 capable PHY is connected to MDIO. 0b - Disabled 1b - Enabled
0 GB	GMII Busy Indicates the status of GMII busy. Writing 1 to this field instructs SMA to initiate a read or write access to the MDIO slave. MAC writes 0 to the field after the MDIO frame transfer is complete. Therefore, you must not write or change any of the fields in the MAC_MDIO_Address and MAC_MDIO_Data registers as long as the value of this field is 1. For write transfers, before writing 1 to this field, you must write a 16-bit data to MAC_MDIO_Data[GD] and MAC_MDIO_Data[RA] if C45E = 1. If C45E = 1, you must also write to MAC_MDIO_Data[RA] before initiating a read transfer. After a read transfer completes (GB = 0), a data read from the PHY register is valid in MAC_MDIO_Data[GD]. **NOTE** Even if the addressed PHY is not present, there is no change in the functionality of this field. Access restrictions apply to this field. It clears automatically and writing 0 to it has no effect. 0b - Disabled 1b - Enabled

78.17.46 MAC MDIO Data (MAC_MDIO_Data)

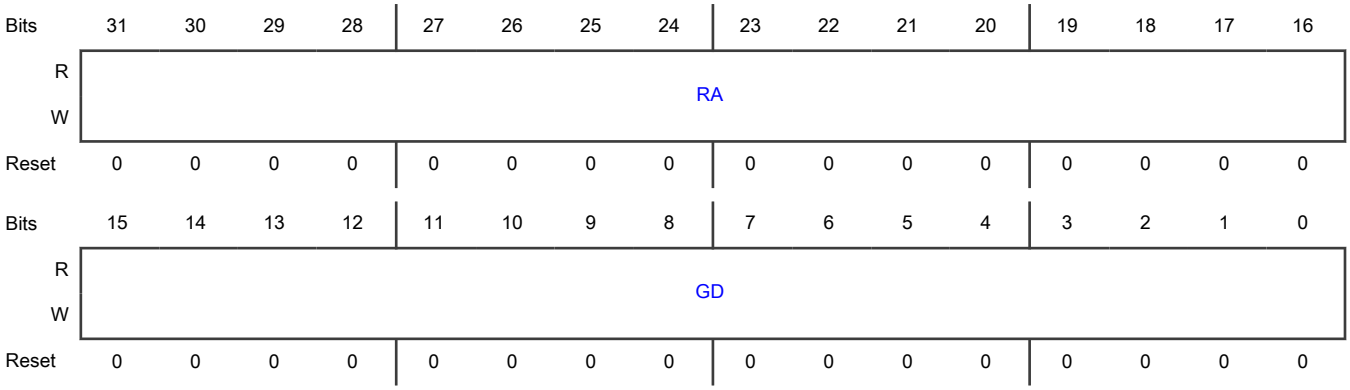
Offset

Register	Offset
MAC_MDIO_Data	204h

Function

Is used to store the write data to be written to the PHY register located at the address specified in MAC MDIO Address (MAC_MDIO_Address). This register also stores the read data from the PHY register located at the address that MAC MDIO Address (MAC_MDIO_Address) specifies.

Diagram



Fields

Field	Function
31-16 RA	Register Address Contains the PHY register address intended for the MDIO frame. This field is valid only when MAC_MDIO_Address[C45E] = 1.
15-0 GD	GMII Data Contains the 16-bit data value read from PHY or RevMII after a management read operation or the 16-bit data value to be written to PHY or RevMII before a management write operation.

78.17.47 MAC CSR Software Control (MAC_CSR_SW_Ctrl)

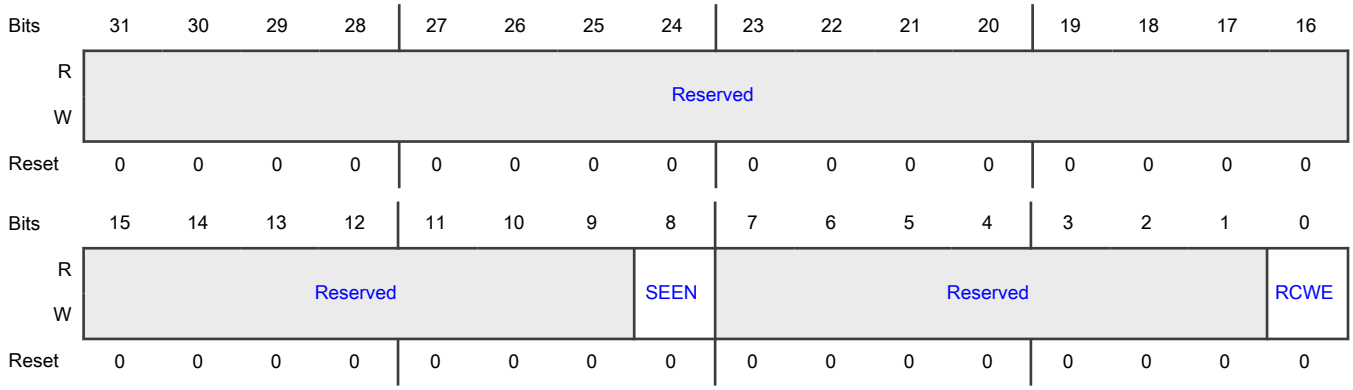
Offset

Register	Offset
MAC_CSR_SW_Ctrl	230h

Function

Contains software programmable controls for changing the CSR access response and clearing the status bits on read.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 SEEN	Slave Error Response Enable Indicates the status of the slave error response. • If this field is 1, MAC responds with a slave error for accesses to reserved registers in the CSR space. • If this field is 0, MAC sends an "okay" response to registers accessed from the CSR space. 0b - Disabled 1b - Enabled
7-1 —	Reserved
0 RCWE	Enable Register Write 1 To Clear (W1C) Enables and disables the W1C feature for some registers. When this field is 1, the access mode of some of the other fields changes from R2C to W1C. When this field is 0, the access mode of those fields remains R2C. 0b - Disabled 1b - Enabled

78.17.48 MAC FPE Control STS (MAC_FPE_CTRL_STS)

Offset

Register	Offset
MAC_FPE_CTRL_STS	234h

Function

Controls the operation of frame preemption.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	Reserved												S1_SET_0	SRSP	SVER	EFPE
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-20 —	Reserved
19 TRSP	Transmitted Respond Frame Indicates whether the respond frame is transmitted. This field becomes 1 when a respond frame is transmitted (triggered by writing 1 to the SRSP field). An interrupt can be generated for this event if you write 1 to MAC_Interrupt_Enable[FPEIE]. Access restrictions apply to this field. TRSP becomes a W1C field when MAC_CSR_SW_Ctrl[RCWE] = 1, and becomes an R2C field when MAC_CSR_SW_Ctrl[RCWE] = 0. Thus, TRSP becomes 0 sometimes when you read it and sometimes when you write 1 to it. It automatically becomes 1 on an internal event. 0b - Not transmitted 1b - Transmitted
18 TVER	Transmitted Verify Frame Indicates whether the verify frame is transmitted. This field becomes 1 when a verify frame is transmitted (triggered by writing 1 to the SVER field). An interrupt can be generated for this event if you write 1 to MAC_Interrupt_Enable[FPEIE]. Access restrictions apply to this field. The field clears on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. It automatically becomes 1 on an internal event. 0b - Not transmitted 1b - Transmitted
17 RRSP	Received Respond Frame Indicates whether the respond frame is received.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field becomes 1 when a respond frame is received. An interrupt can be generated for this event if you write 1 to MAC_Interrupt_Enable[FPEIE]. Access restrictions apply to this field. The field clears on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. It automatically becomes 1 on an internal event. 0b - Not received 1b - Received
16 RVER	Received Verify Frame Indicates whether the verify frame is received. This field becomes 1 when a verify frame is received. An interrupt can be generated on the transmission of a packet if you write 1 to MAC_Interrupt_Enable[FPEIE]. Access restrictions apply to this field. The field clears on read or write of 1 when MAC_CSR_SW_Ctrl[RCWE] = 1. It automatically becomes 1 on an internal event. 0b - Not received 1b - Received
15-4 —	Reserved
3 S1_SET_0	S1 SET 0 Is reserved for NXP internal use and must always be 0 unless instructed by NXP. Writing 1 to this field may cause unexpected behavior.
2 SRSP	Send Respond mPacket Indicates the status of the send respond mPacket. If this field is 1, it indicates the hardware to send a respond mPacket. The hardware resets the field after sending the respond mPacket. Access restrictions apply to this field. It clears automatically and writing 0 to it has no effect. 0b - Disabled 1b - Enabled
1 SVER	Send Verify mPacket Enables and disables the sending of a verify mPacket. Write 1 to this field to command EMAC to send a verify mPacket. EMAC writes 0 to this field after sending the verify mPacket. Access restrictions apply to this field. It clears automatically and writing 0 to it has no effect. 0b - Disabled 1b - Enabled
0	Enable Transmit Frame Preemption

Table continues on the next page...

Table continued from the previous page...

Field	Function
EFPE	Enables or disables the frame preemption transmit functionality. 0b - Disabled 1b - Enabled

78.17.49 MAC Presentation Time (MAC_Presn_Time_ns)

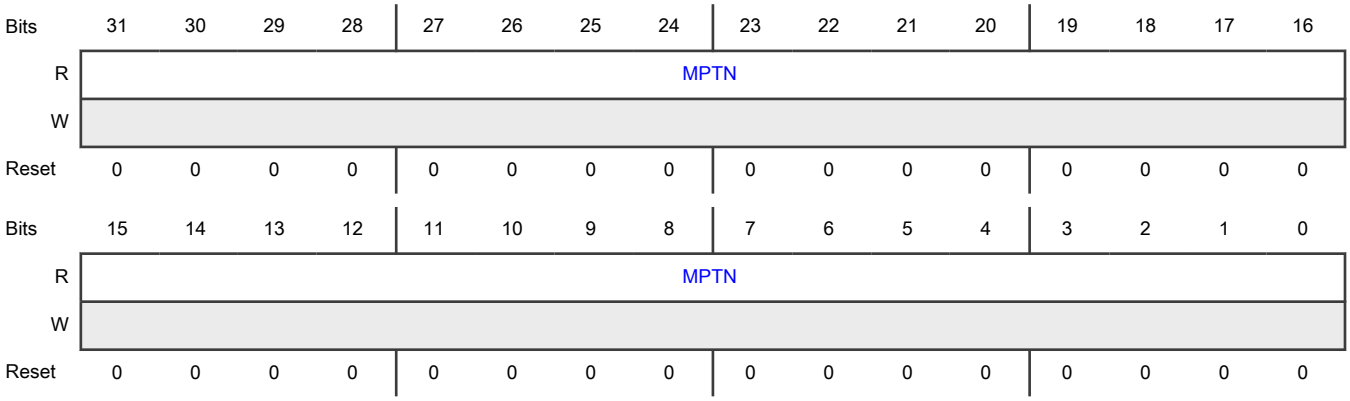
Offset

Register	Offset
MAC_Presn_Time_ns	240h

Function

Contains the 32-bit binary rollover equivalent time of the PTP system time (in nanoseconds) and exists when DWC_EQOS_FLEXI_PPS_OUT_EN is configured.

Diagram



Fields

Field	Function
31-0 MPTN	MAC 1722 Presentation Time (In Nanoseconds) Indicates the value of the 32-bit binary rollover equivalent time of the PTP System Time (in ns).

78.17.50 MAC Presentation Time Update (MAC_Presn_Time_Updt)

Offset

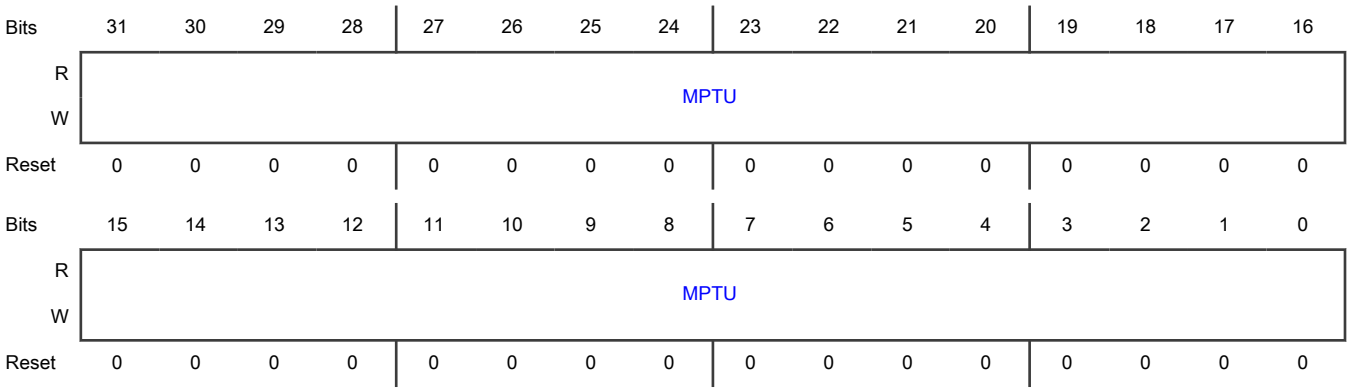
Register	Offset
MAC_Presn_Time_Updt	244h

Function

Holds the 32-bit value of MAC 1722 presentation time (in ns), which must be added to the current presentation time counter value. Initialization happens when MAC_Timestamp_Control[TSINIT] = 1, and an update happens when MAC_Timestamp_Control[TSUPDT] = 1.

Exists when DWC_EQOS_FLEXI_PPS_OUT_EN is configured.

Diagram



Fields

Field	Function
31-0 MPTU	MAC 1722 Presentation Time Update Holds the initial value or the update value for the presentation time. When used for an update, this field holds the 32-bit value (in ns), which must be added to the current presentation time counter value. Initialization happens when MAC_Timestamp_Control[TSINIT] = 1, and an update happens when MAC_Timestamp_Control[TSUPDT] = 1. When MAC_System_Time_Nanoseconds_Update[ADDSUB] = 1, this value is directly used for subtraction.

78.17.51 MAC Address 0 High (MAC_Address0_High)

Offset

Register	Offset
MAC_Address0_High	300h

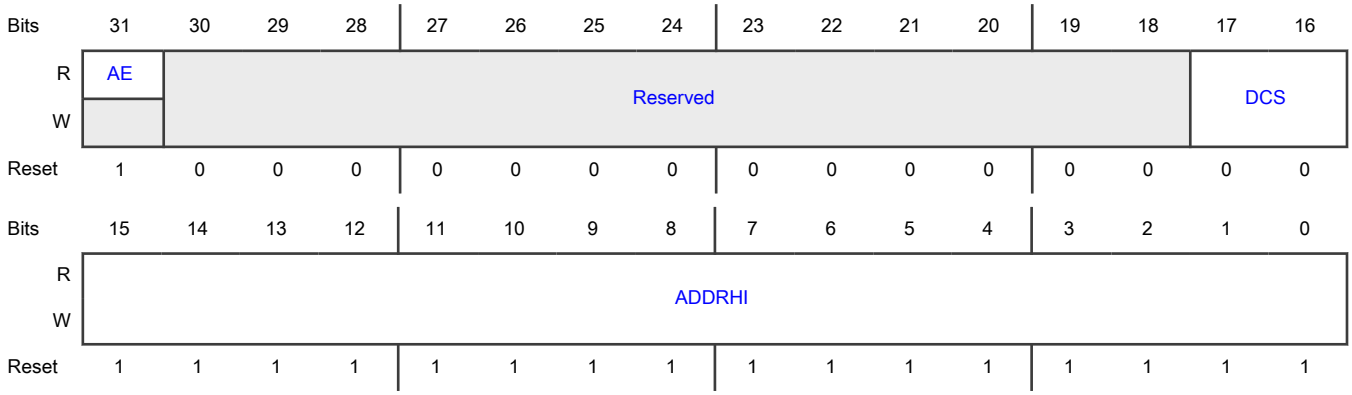
Function

Holds the upper 16 bits of the first 6-byte MAC address of the station.

The first DA byte that is received on the (G)MII interface corresponds to the LS byte (bits [7:0]) of MAC Address 0 Low (MAC_Address0_Low). For example, if 112233445566h is received (11h in lane 0 of the first column) on (G)MII as the destination address, MAC Address 0 Low (MAC_Address0_Low)[47:0] is compared to 665544332211h.

If MAC address registers are configured to be double-synchronized with the (G)MII clock domains, the synchronization is triggered only when bits [31:24] (in Little-Endian mode) or bits [7:0] (in Big-Endian mode) of MAC Address 0 Low (MAC_Address0_Low) are written to. For proper synchronization updates, the consecutive writes to MAC Address 0 Low (MAC_Address0_Low) must be performed after at least four clock cycles in the destination clock domain.

Diagram



Fields

Field	Function
31 AE	Address Enable Enables MAC address 0b - Disabled and invalid (the field's value must always be 1) 1b - Enabled
30-18 —	Reserved
17-16 DCS	DMA Channel Select If MAC_Ext_Configuration[PDC] = 0, this field contains the binary representation of the DMA channel number to which a receive packet whose DA matches MAC Address 0 Low (MAC_Address0_Low) content is routed. If MAC_Ext_Configuration[PDC] = 1, this field contains the one-hot representation of one or more DMA channel numbers to which a receive packet whose DA matches MAC Address 0 Low (MAC_Address0_Low) content is routed.
15-0 ADDRHI	MAC Address 0 [47:32] Contains the upper 16 bits [47:32] of the first 6-byte MAC address. MAC uses this field for filtering the received packets and inserting the MAC address in the transmit flow control (pause) packets.

78.17.52 MAC Address 0 Low (MAC_Address0_Low)

Offset

Register	Offset
MAC_Address0_Low	304h

Function

Holds the lower 32 bits of the 6-byte first MAC address of the station.

Diagram

Fields

Field	Function
31-0 ADDRLO	MAC Address 0 [31:0] Contains the lower 32 bits of the first 6-byte MAC address. MAC uses this field to filter the received packets and insert the MAC address in the transmit flow control (pause) packets.

78.17.53 MAC Address 1 High (MAC_Address1_High)

Offset

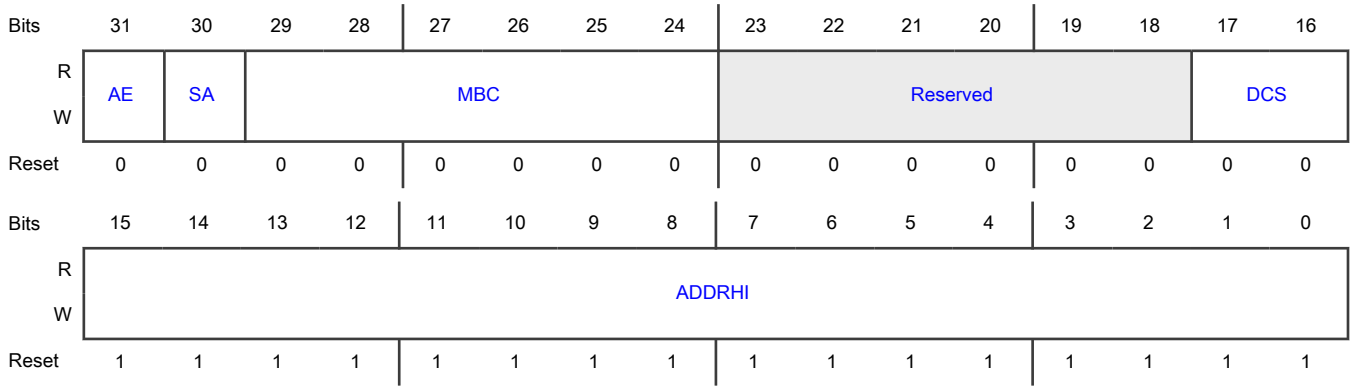
Register	Offset
MAC_Address1_High	308h

Function

Holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized with the (G)MII clock domains, the synchronization is triggered only when bits [31:24] (in Little-Endian mode) or bits [7:0] (in Big-Endian mode) of MAC Address 1 Low (MAC_Address1_Low) are written to. For proper synchronization updates, the consecutive writes to MAC Address 1 Low (MAC_Address1_Low) must be performed after at least four clock cycles in the destination clock domain.

Diagram



Fields

Field	Function
31 AE	Address Enable Indicates whether the MAC address is enabled or ignored. If this field is 1, the address filter module uses the second MAC address for perfect filtering. If this field is 0, the address filter module ignores the address used for filtering. 0b - Ignored 1b - Enabled
30 SA	Source Address Indicates whether the MAC address is compared to the source or destination address. If this field is 1, MAC Address 1[47:0] is compared to the SA fields of the received packet. If this field is 0, MAC Address 1[47:0] is compared to the DA fields of the received packet. 0b - Destination address 1b - Source address
29-24 MBC	Mask Byte Control Contains mask control bits for comparing each of the MAC address bytes. If this field is 1, MAC does not compare the corresponding byte of the received DA or SA with the contents of the MAC address 1 registers. Each bit controls the masking of the bytes as follows: • Bit 29: MAC Address 1 High[15:8] • Bit 28: MAC Address 1 High[7:0] • Bit 27: MAC Address 1 Low[31:24] • - .. • Bit 24: MAC Address 1 Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23-18	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
17-16 DCS	DMA Channel Select If MAC_Ext_Configuration[PDC] = 0, this field contains the binary representation of the DMA channel number to which a receive packet whose DA matches MAC Address 1 Low (MAC_Address1_Low) content is routed. If MAC_Ext_Configuration[PDC] = 1, this field contains the one-hot representation of one or more DMA Channel numbers to which a receive packet whose DA matches MAC Address 1 Low (MAC_Address1_Low) content is routed.
15-0 ADDRHI	MAC Address 1 [47:32] Contains the upper 16 bits [47:32] of the second 6-byte MAC address.

78.17.54 MAC Address 1 Low (MAC_Address1_Low)

Offset

Register	Offset
MAC_Address1_Low	30Ch

Function

Holds the lower 32 bits of the second 6-byte MAC address of the station.

Fields

Field	Function
31 AE	Address Enable Indicates whether the MAC address is enabled or ignored. If this field is 1, the address filter module uses the second MAC address for perfect filtering. If this field is 0, the address filter module ignores the address for filtering. 0b - Ignored 1b - Enabled
30 SA	Source Address Indicates whether the MAC address is compared to the source or destination address.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	If this field is 1, MAC Address 1[47:0] is compared to the SA fields of the received packet. If this field is 0, MAC Address 1[47:0] is compared to the DA fields of the received packet. 0b - Destination address 1b - Source address
29-24 MBC	Mask Byte Control Contains mask control bits for comparing each of the MAC address bytes. If this field is 1, MAC does not compare the corresponding byte of the received DA or SA with the contents of MAC address 1 registers. Each bit controls the masking of the bytes as follows: • Bit 29: MAC Address 1 High[15:8] • Bit 28: MAC Address 1 High[7:0] • Bit 27: MAC Address 1 Low[31:24] • - .. • Bit 24: MAC Address 1 Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23-18 —	Reserved
17-16 DCS	DMA Channel Select If MAC_Ext_Configuration[PDC] = 0, this field contains the binary representation of the DMA channel number to which a receive packet whose DA matches MAC Address 2 Low (MAC_Address2_Low) content is routed. If MAC_Ext_Configuration[PDC] = 1, this field contains the one-hot representation of one or more DMA Channel numbers to which a receive packet whose DA matches MAC Address 2 Low (MAC_Address2_Low) content is routed.
15-0 ADDRHI	MAC Address 1 [47:32] Contains the upper 16 bits [47:32] of the second 6-byte MAC address.

78.17.56 MAC Address 2 Low (MAC_Address2_Low)

Offset

Register	Offset
MAC_Address2_Low	314h

Function

Holds the lower 32 bits of the second 6-byte MAC address of the station.

Diagram

Fields

Field	Function
31-0 ADDRLO	MAC Address 1 [31:0] Contains the lower 32 bits of the second 6-byte MAC address. The content of this field remains undefined until you load it after the initialization process.

78.17.57 MMC Control (MMC_Control)

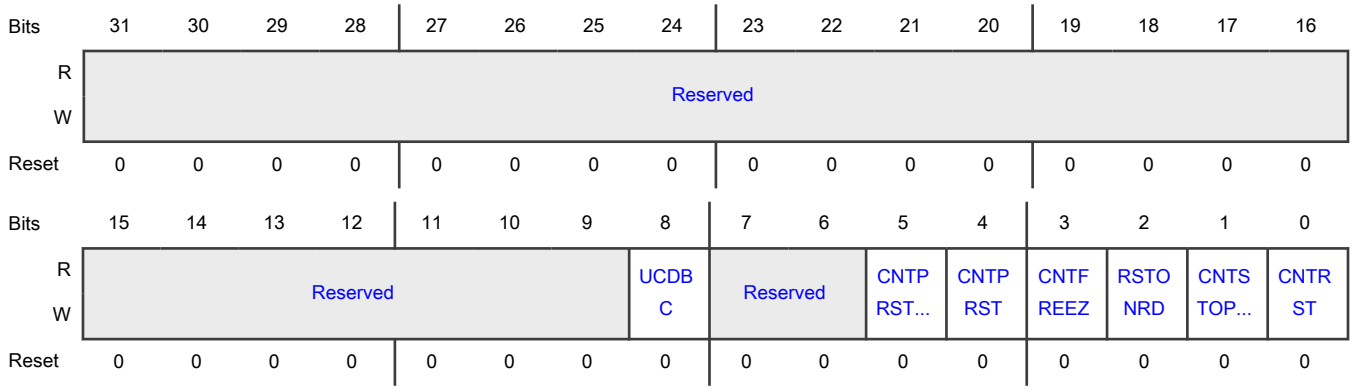
Offset

Register	Offset
MMC_Control	700h

Function

Establishes the operating mode for MMC.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 UCDBC	Update MMC Counters For Dropped Broadcast Packets Indicates the status of MMC counters for dropped broadcast packets. • If this field is 1, MAC updates all the related MMC counters for broadcast packets that are dropped because MAC_Packet_Filter[DBF] = 1. • If this field is 0, the MMC counters are not updated for dropped broadcast packets. **NOTE** The CNTRST field has a higher priority than the CNTPRST field. Therefore, if you write 1 to both these fields in the same write cycle, all the counters are cleared and the CNTPRST field becomes 0. 0b - Disabled 1b - Enabled
7-6 —	Reserved
5 CNTPRSTLVL	Full-Half Preset Indicates whether full-half preset is enabled or disabled. • If this field is 0 and the CNTPRST field is 1, all the MMC counters are preset to the almost-half value. All octet counters are preset to 7FFF_F800h (half 2 Kbytes) and all packet counters are preset to 7FFF_FFF0h (half 16). • If this field is 1 and the CNTPRST field is 1 too, all MMC counters are preset to the almost-full value. All octet counters are preset to FFFF_F800h (full 2 Kbytes) and all packet counters are preset to FFFF_FFF0h (full 16). For 16-bit counters, the almost-half preset values are 7800h and 7FF0h for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0. 0b - Disabled 1b - Enabled
4 CNTPRST	Counters Preset Indicates whether MMC counter preset is enabled or disabled. If this field is 1, all the counters are initialized or preset to almost full or almost half according to the settings of the CNTPRSTLVL field. This field clears automatically after 1 clock cycle, and along with the CNTPRSTLVL field, is useful for debugging and testing the assertion of interrupts because of the MMC counter becoming half-full or full. Access restrictions apply to this field, which clears automatically. 0b - Disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Enabled
3 CNTFREEZ	MMC Counter Freeze Indicates the status of MMC counter freeze. If this field is 1, the field freezes all the MMC counters to their current values. Until this field becomes 0, no MMC counter is updated because of any transmitted or received packets. If an MMC counter is read when RSTONRD = 1, that counter is also cleared in this mode. 0b - Disabled 1b - Enabled
2 RSTONRD	Reset On Read Indicates whether the reset on read for MMC counters is enabled or disabled. If this field is 1, MMC counters are reset to 0 after read (they clear automatically after reset). The counters are cleared when the least significant byte lane (bits [7:0]) is read. 0b - Disabled 1b - Enabled
1 CNTSTOPRO	Counter Stop Rollover Indicates the status of counter stop rollover. If this field is 1, the counter does not roll over to 0 after reaching the maximum value. 0b - Disabled 1b - Enabled
0 CNTRST	Counters Reset Indicates whether MMC counters are reset. If this field is 1, all the counters are reset. This field clears automatically after 1 clock cycle. Access restrictions apply to this field that clears automatically. 0b - Counters are not reset 1b - All counters are reset

78.17.58 MMC Receive Interrupt (MMC_Rx_Interrupt)

Offset

Register	Offset
MMC_Rx_Interrupt	704h

Function

Maintains the interrupts generated from all receive statistics counters when the following conditions occur:

- Receive statistic counters reach half of their maximum values (8000_0000h for a 32-bit counter and 8000h for a 16-bit counter).
- Receive statistic counters cross their maximum values (FFFF_FFFFh for a 32-bit counter and FFFFh for a 16-bit counter).

If MMC_Control[CNTSTOPRO] = 1, interrupts are set but the counter remains at all-ones. This is a 32-bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (bits [7:0]) of the respective counter must be read to clear the interrupt bit.

NOTE

R_SS_RC means that this register bit is set internally, and is cleared when the counter register is read.

Field	Function
	Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
2 RXGOCTIS	MMC Receive Good Octet Counter Interrupt Status Indicates whether the status of the MMC receive good octet counter interrupt is detected. This field becomes 1 when the rxoctetcount_g counter reaches half of its maximum value or its maximum value. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
1 RXGBOCTIS	MMC Receive Good Bad Octet Counter Interrupt Status Indicates whether the status of the MMC receive good bad octet counter interrupt is detected. This field becomes 1 when the rxoctetcount_gb counter reaches half of its maximum value or the maximum value. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
0 RXGBPKTIS	MMC Receive Good Bad Packet Counter Interrupt Status Indicates whether the status of the MMC receive good bad packet counter interrupt is detected. This field becomes 1 when the rxpacketcount_gb counter reaches half of its maximum value or its maximum value. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected

78.17.59 MMC Transmit Interrupt (MMC_Tx_Interrupt)

Offset

Register	Offset
MMC_Tx_Interrupt	708h

Function

Maintains the interrupts generated from all the transmit statistics counters.

This register maintains those interrupts that are generated when transmit statistic counters:

- Reach half of their maximum values (8000_0000h for a 32-bit counter and 0x8000 for a 16-bit counter)
- Cross their maximum values (FFFF_FFFFh for a 32-bit counter and FFFFh for a 16-bit counter)

If MMC_Control[CNTSTOPRO] = 1, the interrupts are set but the counter remains at all-ones.

This is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (bits [7:0]) of the respective counter must be read to clear the interrupt bit.

2 TXBCGPIS	MMC Transmit Broadcast Good Packet Counter Interrupt Status Indicates whether the status of the MMC transmit broadcast good packet counter interrupt is detected. This field becomes 1 when the txbroadcastpackets_g counter reaches half of its maximum value or the maximum value. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
1 TXGBPKTIS	MMC Transmit Good Bad Packet Counter Interrupt Status Indicates whether the status of the MMC transmit good bad packet counter interrupt is detected. This field becomes 1 when the txpacketcount_gb counter reaches half of its maximum value or the maximum value. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
0 TXGBOCTIS	MMC Transmit Good Bad Octet Counter Interrupt Status Indicates whether the status of the MMC transmit good bad octet counter interrupt is detected. This field becomes 1 when the txoctetcount_gb counter reaches half of its maximum value or the maximum value. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected

78.17.60 MMC Receive Interrupt Mask (MMC_Rx_Interrupt_Mask)

Offset

Register	Offset
MMC_Rx_Interrupt_Mask	70Ch

Function

Maintains the masks for interrupts generated from all the receive statistic counters. These interrupts are generated when the receive statistic counters reach half of their maximum values or the maximum values.

Field	Function
RX65T127OCTGBPIM	Indicates the status of the MMC receive 65 to 127 octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rx65to127octets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
11 RX64OCTGBPIM	MMC Receive 64-Octet Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC receive 64-octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rx64octets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
10 RXOSIZEGPIM	MMC Receive Oversize Good Packet Counter Interrupt Mask Indicates the status of the MMC receive oversize good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxoversize_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
9 RXUSIZEGPIM	MMC Receive Undersize Good Packet Counter Interrupt Mask Indicates the status of the MMC receive undersize good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxundersize_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
8 RXJABERPIM	MMC Receive Jabber Error Packet Counter Interrupt Mask Indicates the status of the MMC receive jabber error packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxjabbererror counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
7 RXRUNTPIM	MMC Receive Runt Packet Counter Interrupt Mask Indicates the status of the MMC receive runt packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxrunterror counter reaches half of its maximum value or the maximum value.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
6 RXALGNERPIM	MMC Receive Alignment Error Packet Counter Interrupt Mask Indicates the status of the MMC receive alignment error packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxalignmenterror counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
5 RXCRCERPIM	MMC Receive CRC Error Packet Counter Interrupt Mask Indicates the status of the MMC receive CRC error packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxcrcerror counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
4 RXMCGPIM	MMC Receive Multicast Good Packet Counter Interrupt Mask Indicates the status of the MMC receive multicast good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxmulticastpackets_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
3 RXBCGPIM	MMC Receive Broadcast Good Packet Counter Interrupt Mask Indicates the status of the MMC receive broadcast good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxbroadcastpackets_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
2 RXGOCTIM	MMC Receive Good Octet Counter Interrupt Mask Indicates the status of the MMC receive good octet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxoctetcount_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
1	MMC Receive Good Bad Octet Counter Interrupt Mask

Table continues on the next page...

Table continued from the previous page...

Field	Function
RXGBOCTIM	Indicates the status of the MMC receive good bad octet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxoctetcount_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
0 RXGBPKTIM	MMC Receive Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC receive good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the rxpacketcount_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled

78.17.61 MMC Transmit Interrupt Mask (MMC_Tx_Interrupt_Mask)

Offset

Register	Offset
MMC_Tx_Interrupt_Mask	710h

Function

Maintains the masks for interrupts that are generated when the transmit statistic counters reach half of their maximum values or their maximum values.

31-28 —	Reserved
27 —	Reserved
26 —	Reserved
25 TXOSIZEGPIM	MMC Transmit Oversize Good Packet Counter Interrupt Mask Indicates the status of the MMC transmit oversize good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txoversize_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
24 TXVLANGPIM	MMC Transmit VLAN Good Packet Counter Interrupt Mask Indicates the status of the MMC transmit VLAN good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txvlanpackets_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
23 TXPAUSPIM	MMC Transmit Pause Packet Counter Interrupt Mask Indicates the status of the MMC transmit pause packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txpausepackets counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
22 TXEXDEFPIM	MMC Transmit Excessive Deferral Packet Counter Interrupt Mask Indicates the status of the MMC transmit excessive deferral packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txexcessdef counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
21 TXGPKTIM	MMC Transmit Good Packet Counter Interrupt Mask Indicates the status of the MMC transmit good packet counter interrupt mask.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Writing 1 to this field masks the interrupt when the txpacketcount_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
20 TXGOCTIM	MMC Transmit Good Octet Counter Interrupt Mask Indicates the status of the MMC transmit good octet counter interrupt mask. Writing 1 to this field masks the interrupt when the txoctetcount_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
19 TXCARERPIM	MMC Transmit Carrier Error Packet Counter Interrupt Mask Indicates the status of the MMC transmit carrier error packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txcarriererror counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
18 TXEXCOLPIM	MMC Transmit Excessive Collision Packet Counter Interrupt Mask Indicates the status of the MMC transmit excessive collision packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txexcesscol counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
17 TXLATCOLPIM	MMC Transmit Late Collision Packet Counter Interrupt Mask Indicates the status of the MMC transmit late collision packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txlatecol counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
16 TXDEFPIM	MMC Transmit Deferred Packet Counter Interrupt Mask Indicates the status of the MMC transmit deferred packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txdeferred counter reaches half of the maximum value or the maximum value. 0b - Disabled 1b - Enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
15 TXMCOLGPIM	MMC Transmit Multiple Collision Good Packet Counter Interrupt Mask Indicates the status of the MMC transmit multiple collision good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txmulticol_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
14 TXSCOLGPIM	MMC Transmit Single Collision Good Packet Counter Interrupt Mask Indicates the status of the MMC transmit single collision good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txsinglecol_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
13 TXUFLOWERPIM	MMC Transmit Underflow Error Packet Counter Interrupt Mask Indicates the status of the MMC transmit underflow error packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txunderflowerror counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
12 TXBCGBPIM	MMC Transmit Broadcast Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit broadcast good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txbroadcastpackets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
11 TXMCGBPIM	MMC Transmit Multicast Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit multicast good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txmulticastpackets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
10 TXUCGBPIM	MMC Transmit Unicast Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit unicast good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txunicastpackets_gb counter reaches half of its maximum value or the maximum value.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
9 TX1024TMAXOCTGBPIM	MMC Transmit 1024 To Maximum Octet Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit 1024 to maximum octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the tx1024tomaxoctets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
8 TX512T1023OCTGBPIM	MMC Transmit 512 To 1023 Octet Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit 512 to 1023 octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the tx512to1023octets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
7 TX256T511OCTGBPIM	MMC Transmit 256 To 511 Octet Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit 256 to 511 octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the tx256to511octets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
6 TX128T255OCTGBPIM	MMC Transmit 128 To 255 Octet Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit 128 to 255 octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the tx128to255octets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
5 TX65T127OCTGBPIM	MMC Transmit 65 To 127 Octet Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit 65 to 127 octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the tx65to127octets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
4	MMC Transmit 64-Octet Good Bad Packet Counter Interrupt Mask

Table continues on the next page...

Table continued from the previous page...

Field	Function
TX64OCTGBPIM	Indicates the status of the MMC transmit 64-octet good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the tx64octets_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
3 TXMCGPIM	MMC Transmit Multicast Good Packet Counter Interrupt Mask Indicates the status of the MMC transmit multicast good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txmulticastpackets_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
2 TXBCGPIM	MMC Transmit Broadcast Good Packet Counter Interrupt Mask Indicates the status of the MMC transmit broadcast good packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txbroadcastpackets_g counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
1 TXGBPKTIM	MMC Transmit Good Bad Packet Counter Interrupt Mask Indicates the status of the MMC transmit good bad packet counter interrupt mask. Writing 1 to this field masks the interrupt when the txpacketcount_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled
0 TXGBOCTIM	MMC Transmit Good Bad Octet Counter Interrupt Mask Indicates the status of the MMC transmit good bad octet counter interrupt mask. Writing 1 to this field masks the interrupt when the txoctetcount_gb counter reaches half of its maximum value or the maximum value. 0b - Disabled 1b - Enabled

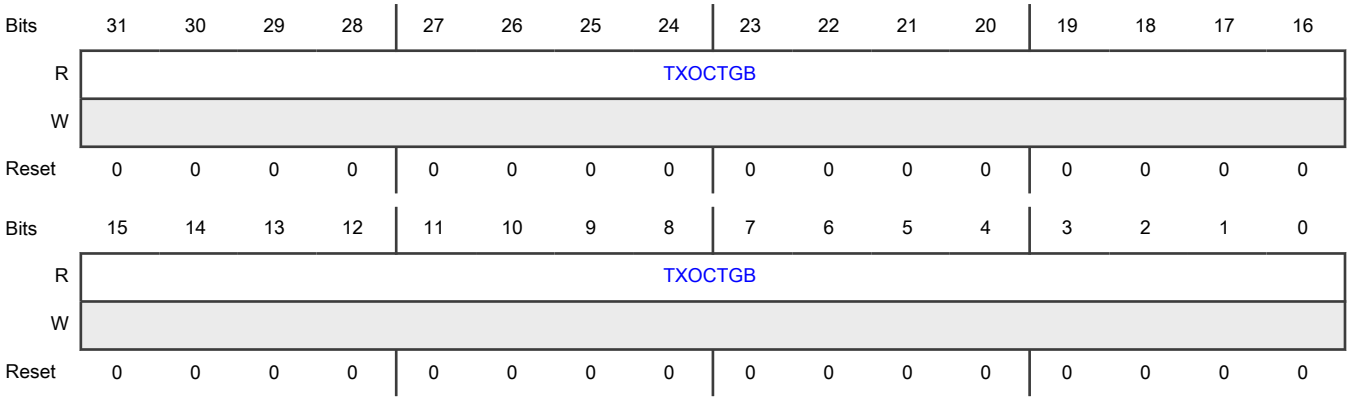
78.17.62 Transmit Octet Count Good Bad (Tx_Octet_Count_Good_Bad)

Offset

Register	Offset
Tx_Octet_Count_Good_Bad	714h

Function
Provides the number of bytes that the module transmitted, exclusive of preamble and retried bytes, in good and bad packets.

Diagram



Fields

Field	Function
31-0 TXOCTGB	Transmit Octet Count Good Bad Indicates the number of bytes transmitted, exclusive of preamble and retried bytes, in good and bad packets.

78.17.63 Transmit Packet Count Good Bad (Tx_Packet_Count_Good_Bad)

Offset

Register	Offset
Tx_Packet_Count_Good_Bad	718h

Function
Provides the number of good and bad packets that the module transmitted, exclusive of retried packets.

Field	Function
31-0 TXCARR	Transmit Carrier Error Packets Indicates the number of packets aborted because of a carrier sense error (such as no carrier or loss of carrier).

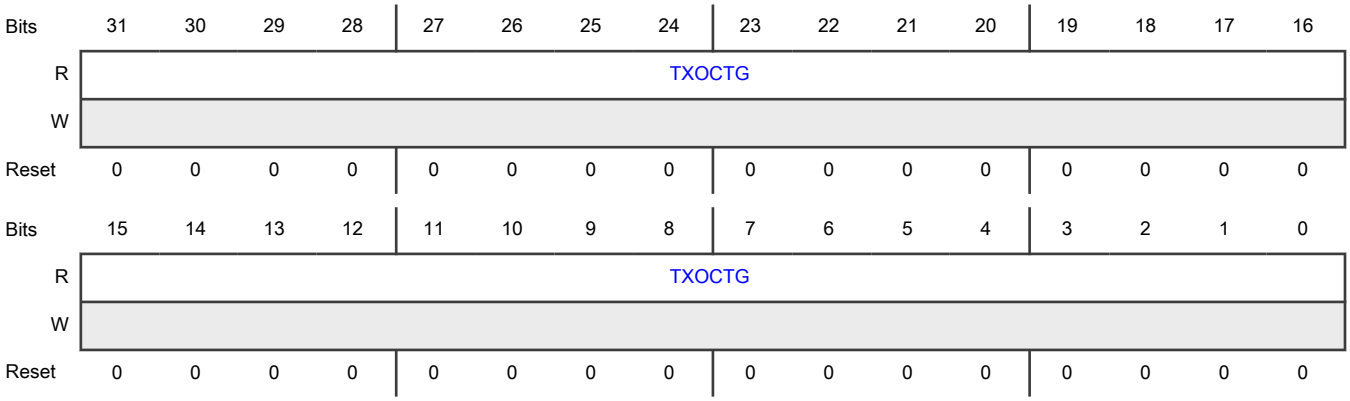
78.17.82 Transmit Octet Count Good (Tx_Octet_Count_Good)

Offset

Register	Offset
Tx_Octet_Count_Good	764h

Function
Provides the number of bytes that the module transmitted, exclusive of preamble, only in good packets.

Diagram



Fields

Field	Function
31-0 TXOCTG	Transmit Octet Count Good Indicates the number of bytes transmitted, exclusive of preamble, only in good packets.

78.17.83 Transmit Packet Count Good (Tx_Packet_Count_Good)

Offset

Register	Offset
Tx_Packet_Count_Good	768h

Function

Provides the number of good packets that the module transmitted.

Field	Function
31-0 TXVLANG	Transmit VLAN Packets Good Provides the number of good VLAN packets transmitted.

78.17.87 Transmit O Size Packets Good (Tx_OSize_Packets_Good)

Offset

Register	Offset
Tx_OSize_Packets_Good	778h

Function

Provides the number of packets that the module transmitted without errors, and having a length greater than the maximum size, which is 1,518 or 1,522 bytes for VLAN-tagged packets. This size is 2000 bytes if MAC_Configuration[S2KP] = 1.

Field	Function
31-0 RXALGNERR	Receive Alignment Error Packets Indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

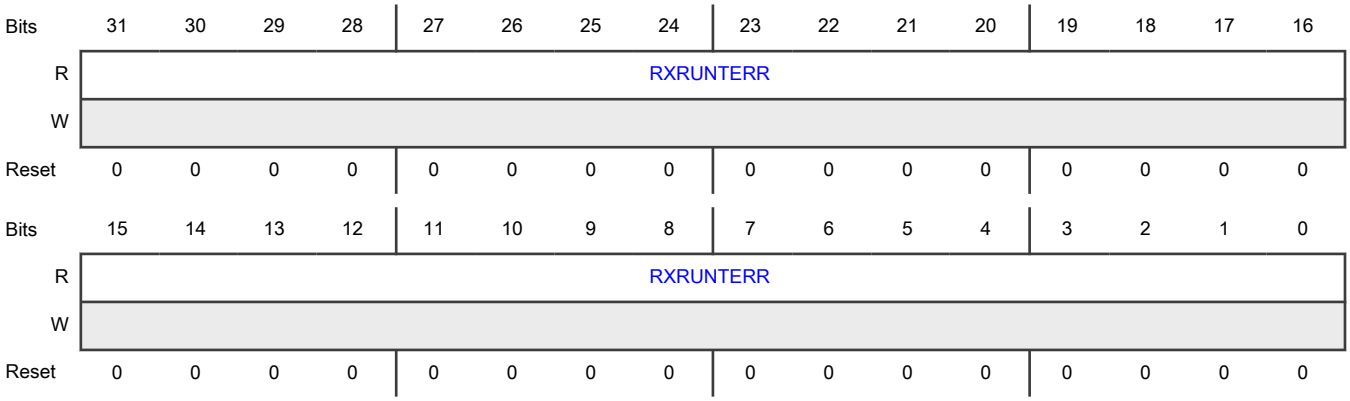
78.17.95 Receive Runt Error Packets (Rx_Runt_Error_Packets)

Offset

Register	Offset
Rx_Runt_Error_Packets	79Ch

Function
Provides the number of runt packets, which have a length less than 64 bytes and a CRC error, that the module received.

Diagram



Fields

Field	Function
31-0 RXRUNTERR	Receive Runt Error Packets Indicates the number of runt packets received.

78.17.96 Receive Jabber Error Packets (Rx_Jabber_Error_Packets)

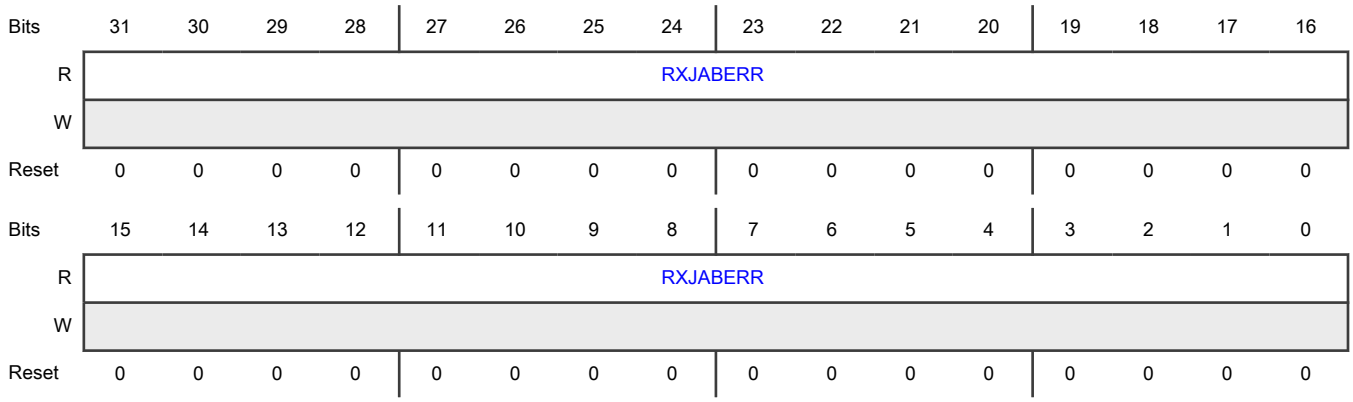
Offset

Register	Offset
Rx_Jabber_Error_Packets	7A0h

Function

Provides the number of giant packets that the module received, having a length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN-tagged packets), and with a CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN-tagged packets) are considered as giant packets.

Diagram



Fields

Field	Function
31-0 RXJABERR	Receive Jabber Error Packets Indicates the number of giant packets received, having a length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN-tagged packets), and with a CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN-tagged packets) are considered as giant packets.

78.17.97 Receive Undersize Packets Good (Rx_Undersize_Packets_Good)

Offset

Register	Offset
Rx_Undersize_Packets_Good	7A4h

Function

Provides the number of packets that the module received, having a length less than 64 bytes, but without any errors.

Diagram

78.17.111 Receive Watchdog Error Packets (Rx_Watchdog_Error_Packets)

Offset

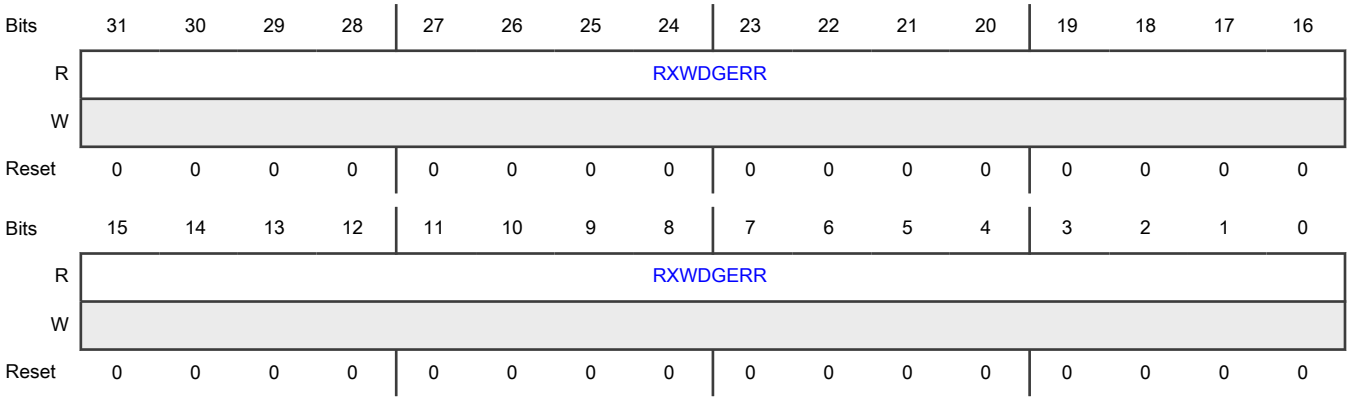
Register	Offset
Rx_Watchdog_Error_Packets	7DCh

Function

Provides the number of packets that the module received with a watchdog timeout error. Packets with a data load larger than the following are received:

- 2,048 bytes when MAC_Configuration[JE] = 0 and MAC_Configuration[WD] = 0
- 10,240 bytes when MAC_Configuration[JE] = 1 and MAC_Configuration[WD] = 0
- 16,384 bytes when MAC_Configuration[WD] = 1 or the value programmed in MAC Watchdog Timeout (MAC_Watchdog_Timeout)

Diagram



Fields

Field	Function
31-0 RXWDGERR	Receive Watchdog Error Packets Indicates the number of packets received with a watchdog timeout error. Packets with a data load larger than the following are received:

Fields

Field	Function
31-0 RXCTRLG	Receive Control Packets Good Indicates the number of good control packets received.

78.17.114 MMC Transmit FPE Fragment Counter Interrupt Status (MMC_FPE_Tx_Interrupt)

Offset

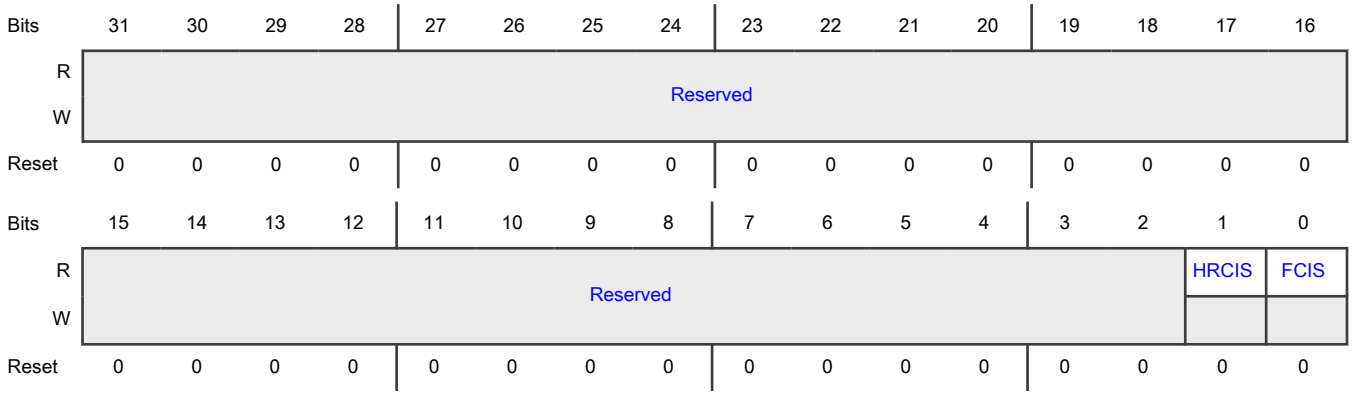
Register	Offset
MMC_FPE_Tx_Interrupt	8A0h

Function

Maintains the interrupts generated from all the FPE-related transmit statistic counters when they reach half of their maximum values (8000_0000h for a 32-bit counter and 8000h for a 16-bit counter), and when they cross their maximum values (FFFF_FFFFh for a 32-bit counter and FFFFh for a 16-bit counter). When MMC_Control[CNTSTOPRO] = 1, the interrupts are set but the counter remains at all-ones.

An interrupt bit of this register becomes 0 when the respective MMC counter that caused the interrupt is read. The least significant byte lane (bits [7:0]) of the respective counter must be read to clear the interrupt bit.

Diagram



Fields

Field	Function
31-2 —	Reserved
1 HRCIS	MMC Transmit Hold Request Counter Interrupt Status Indicates whether the MMC Transmit hold request counter interrupt status is detected. This field: • Becomes 1 when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. • Exists when any one of the receive or transmit MMC counters is enabled during FPE with AV_EST-enabled configuration. Access restrictions apply to this field that clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
0 FCIS	MMC Transmit FPE Fragment Counter Interrupt Status Indicates whether the MMC Transmit FPE fragment counter interrupt status is detected. This field: • Becomes 1 when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. • Exists when any one of the receive or transmit MMC counters is enabled during FPE-enabled configuration. Access restrictions apply to this field that clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected

78.17.115 MMC FPE Transmit Interrupt Mask (MMC_FPE_Tx_Interrupt_Mask)

Offset

Register	Offset
MMC_FPE_Tx_Interrupt_Mask	8A4h

Function

Maintains the masks for interrupts generated from all FPE-related transmit statistics counters. MMC Receive Interrupt Mask (MMC_Rx_Interrupt_Mask) maintains the masks for the interrupts generated when FPE-related receive statistic counters reach half of their maximum value or the maximum value.

Diagram

Fields

Field	Function
31-0 TXFFC	Transmit FPE Fragment Counter Indicates the number of additional mPackets transmitted because of preemption. Exists when any one of the receive, transmit, or MMC counters is enabled during FPE-enabled configuration.

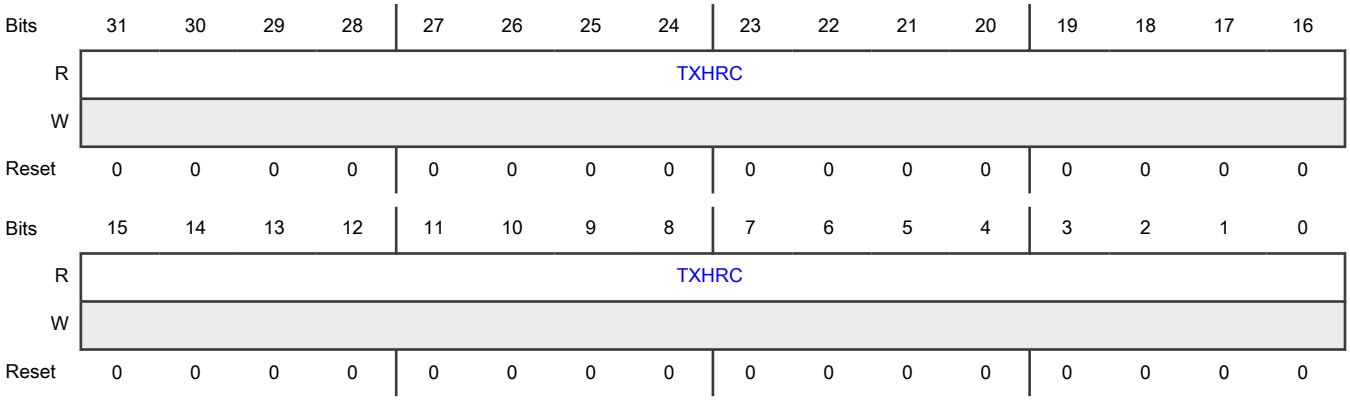
78.17.117 Transmit Hold Request Counter (MMC_Tx_Hold_Req_Cntr)

Offset

Register	Offset
MMC_Tx_Hold_Req_Cntr	8ACh

Function
Provides the count of times that a hold request is given to MAC.

Diagram



Fields

Field	Function
31-0 TXHRC	Transmit Hold Request Counter Indicates the count of times that a hold request is given to MAC. Exists when any one of the receive, transmit, or MMC counters is enabled during FPE with AV_EST-enabled configuration.

78.17.118 MMC Receive Packet Assembly Error Counter Interrupt Status (MMC_FPE_Rx_Interrupt)

Offset

Register	Offset
MMC_FPE_Rx_Interrupt	8C0h

Function
Maintains the interrupts generated from all the FPE-related receive statistic counters, when these transmit statistic counters reach half of their maximum values (8000_0000h for a 32-bit counter and 8000h for a 16-bit counter), and when they cross their maximum values (FFFF_FFFFh for a 32-bit counter and FFFFh for 16-bit counter). When MMC_Control[CNTSTOPRO] = 1, the interrupts are set but the counter remains at all-ones. An interrupt bit of this register becomes 0 when the respective

MMC counter that caused the interrupt is read. The least significant byte lane (bits [7:0]) of the respective counter must be read to clear the interrupt bit.

Fields

Field	Function
31-29 —	Reserved
28 DMCHEN0	DMA Channel Select Enable Indicates the status of the DMA channel number. • If this field is 1, it enables the selection of the DMA channel number for the packet that the L3_L4 filter passes. The DMCHN fields indicate the DMA channel number. • If this field is 0, the filter does not decide the DMA channel number. 0b - Disabled 1b - Enabled
27-25 —	Reserved
24 DMCHN0	DMA Channel Number Indicates the DMA channel number. If the value of the DMCHEN fields is 1, this field selects the DMA channel number to which the packet that this filter passes is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM0	Layer 4 Destination Port Inverse Match Enable Indicates the status of layer 4 destination port inverse matching. • If this field is 1, MAC_Layer4_Address0[L4DP0] is enabled for inverse matching. • If this field is 0, MAC_Layer4_Address0[L4DP0] is enabled for perfect matching. This field is valid and applicable only when the L4DPM0 field is 1. 0b - Disabled 1b - Enabled
20 L4DPM0	Layer 4 Destination Port Match Enable Indicates the status of layer 4 destination port matching. • If this field is 1, MAC_Layer4_Address0[L4DP0] is enabled for matching. • If this field is 0, MAC ignores MAC_Layer4_Address0[L4DP0] for matching. 0b - Disabled 1b - Enabled
19	Layer 4 Source Port Inverse Match Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
L4SPIM0	Indicates the status of layer 4 source port inverse matching. • If this field is 1, MAC_Layer4_Address0[L4SP0] is enabled for inverse matching. • If this field is 0, MAC_Layer4_Address0[L4SP0] is enabled for perfect matching. This field is valid and applicable only when MAC_Layer4_Address0[L4SP0] = 1. 0b - Disabled 1b - Enabled
18 L4SPM0	Layer 4 Source Port Match Enable Indicates the status of layer 4 source port matching. • If this field is 1, MAC_Layer4_Address0[L4SP0] is enabled for matching. • If this field is 0, MAC ignores MAC_Layer4_Address0[L4SP0] for matching. 0b - Disabled 1b - Enabled
17 —	Reserved
16 L4PEN0	Layer 4 Protocol Enable Indicates the status of layer 4 protocol. • If this field is 1, MAC_Layer4_Address0[L4SP0] and MAC_Layer4_Address0[L4DP0] are used for matching UDP packets. • If this field is 0, MAC_Layer4_Address0[L4SP0] and MAC_Layer4_Address0[L4DP0] are used for matching TCP packets. Layer 4 matching is performed only when the L4SPM0 field or the L4DPM0 field is 1. 0b - Disabled 1b - Enabled
15-11 L3HDBM0	Layer 3 IP DA Higher Bits Match IPv4 packets: This field contains the number of higher bits of IP DA that are matched in the IPv4 packets. The following list describes the values of this field: • 0: No bits are masked. • 1: LSb[0] is masked. • 2: Two LSbs [1:0] are masked. • - .. • 31: All bits except MSb are masked. IPv6 packets:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Bits [12:11] of this field correspond to bits [6:5] of the L3HSBM0 field, which indicates the number of lower bits of IP SA or DA that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 fields: • 0: No bits are masked. • 1: LSb[0] is masked. • 2: Two LSbs [1:0] are masked. • .. • 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 field or the L3SAM0 field is 1.
10-6 L3HSBM0	Layer 3 IP SA Higher Bits Match IPv4 packets: This field contains the number of lower bits of IP SA that are masked for matching in the IPv4 packets. The following list describes the values of this field: • 0: No bits are masked. • 1: LSb[0] is masked. • 2: Two LSbs [1:0] are masked. • .. • 31: All bits except MSb are masked. IPv6 packets: This field contains bits [4:0] of L3HSBM0. These bits indicate the number of higher bits of IP SA or DA matched in the IPv6 packets. The field is valid and applicable only when the L3DAM0 field or the L3SAM0 field is 1.
5 L3DAIM0	Layer 3 IP DA Inverse Match Enable Indicates the status of layer 3 IP DA inverse matching. • If this field is 1, layer 3 IP DA is enabled for inverse matching. • If this field is 0, layer 3 IP DA is enabled for perfect matching. This field is valid and applicable only if L3DAM0 = 1. 0b - Disabled 1b - Enabled
4 L3DAM0	Layer 3 IP DA Match Enable Indicates the status of layer 3 IP DA matching. • If this field is 1, layer 3 IP DA is enabled for matching. • If this field is 0, MAC ignores layer 3 IP DA for matching.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE If L3PEN0 = 1, you must write 1 to either this field or the L3SAM0 field because either the IPv6 DA or SA can be checked for filtering. 0b - Disabled 1b - Enabled
3 L3SAIM0	Layer 3 IP SA Inverse Match Enable Indicates the status of layer 3 IP SA inverse matching. • If this field is 1, layer 3 IP SA is enabled for inverse matching. • If this field is 0, layer 3 IP SA is enabled for perfect matching. This field is valid and applicable only if the L3SAM0 field is 1. 0b - Disabled 1b - Enabled
2 L3SAM0	Layer 3 IP SA Match Enable Indicates the status of layer 3 IP SA matching. • If this field is 1, layer 3 IP SA matching is enabled. • If this field is 0, MAC ignores layer 3 IP SA matching. **NOTE** If L3PEN0 = 1, you must write 1 to either this field or the L3DAM0 field because either IPv6 SA or DA can be checked for filtering. 0b - Disabled 1b - Enabled
1 —	Reserved
0 L3PEN0	Layer 3 Protocol Enable Indicates the status of layer 3 protocol. • If this field is 1, the layer 3 IP SA or DA matching is enabled for IPv6 packets. • If this field is 0, the layer 3 IP SA or DA matching is enabled for IPv4 packets. The layer 3 matching is performed only when either the L3SAM0 field or the L3DAM0 field is 1. 0b - Disabled 1b - Enabled

78.17.125 MAC Layer 4 Address 0 (MAC_Layer4_Address0)

Offset

Register	Offset
MAC_Layer4_Address0	904h

Function

Provides the layer 4 source and destination port numbers.

MAC Layer 4 Address 1 (MAC_Layer4_Address1), MAC L3 L4 Control 1 (MAC_L3_L4_Control1), MAC Layer 3 Address 0 Reg 1 (MAC_Layer3_Addr0_Reg1), MAC Layer 3 Address 1 Reg 1 (MAC_Layer3_Addr1_Reg1), MAC Layer 3 Address 2 Reg 1 (MAC_Layer3_Addr2_Reg1), and MAC Layer 3 Address 3 Reg 1 (MAC_Layer3_Addr3_Reg1) are reserved registers (RO with a default value) if MAC_Packet_Filter[IPFE] is 0 when configuring the core.

You can configure the layer 3 and layer 4 address registers to be double-synchronized by selecting the synchronize layer 3 and layer 4 address registers to the receive clock domain option while configuring the core. When you select this option, the synchronization is triggered only when bits [31:24] (in Little-Endian mode) or bits [7:0] (in Big-Endian mode) of the layer 3 and layer 4 address registers are written to. For proper synchronization updates, you must perform consecutive writes to the same layer 3 and layer 4 address registers after a delay of at least four destination clock cycles.

Fields

Field	Function
31-0 L3A00	Layer 3 Address 0 Indicates layer 3 address 0. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3SAM0] are 1, this field contains the value to be matched with bits [31:0] of the IP source address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3DAM0] are 1, this field contains the value to be matched with bits [31:0] of the IP destination address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] = 0, and MAC_L3_L4_Control0[L3SAM0] = 1, this field contains the value to be matched with the IP source address field in the IPv4 packets.

78.17.127 MAC Layer 3 Address 1 Reg 0 (MAC_Layer3_Addr1_Reg0)

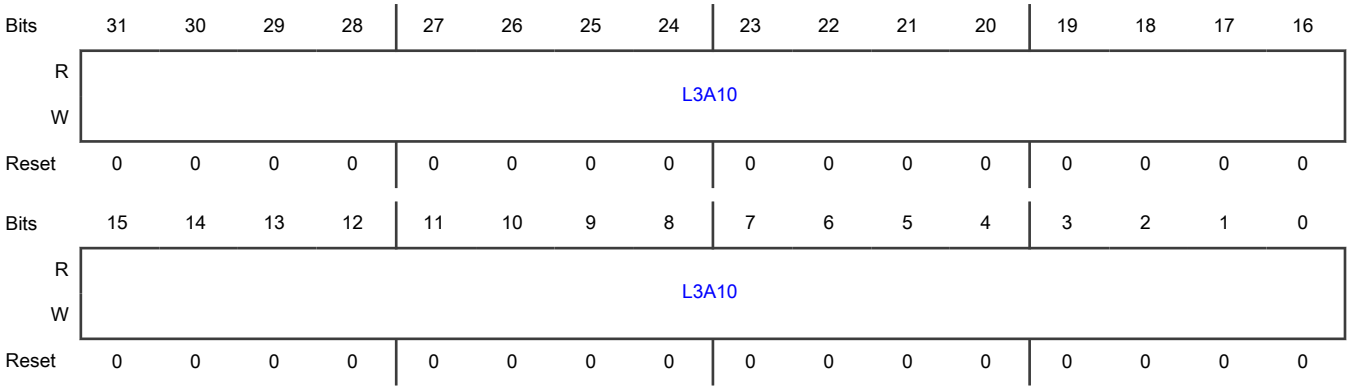
Offset

Register	Offset
MAC_Layer3_Addr1_Reg0	914h

Function

Contains the 32-bit IP destination address field for IPv4 packets. For IPv6 packets, the field contains bits [63:32] of the 128-bit IP source address or destination address field.

Diagram



Fields

Field	Function
31-0 L3A10	Layer 3 Address 1 Indicates layer 3 address 1. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3SAM0] are 1, this field contains the value to be matched with bits [63:32] of the IP source address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3DAM0] are 1, this field contains the value to be matched with bits [63:32] of the IP destination address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] = 0, and MAC_L3_L4_Control0[L3SAM0] = 1, this field contains the value to be matched with the IP source address field in the IPv4 packets.

78.17.128 MAC Layer 3 Address 2 Reg 0 (MAC_Layer3_Addr2_Reg0)

Offset

Register	Offset
MAC_Layer3_Addr2_Reg0	918h

Function

Contains the 32-bit IP destination address field for IPv4 packets. For IPv6 packets, the field contains bits [95:64] of the 128-bit IP source address or destination address field.

Fields

Field	Function
31-0 L3A20	Layer 3 Address 2 Indicates layer 3 address 2. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3SAM0] are 1, this field contains the value to be matched with bits [95:64] of the IP source address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3DAM0] are 1, this field contains the value to be matched with bits [95:64] of the IP destination address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] = 0, this field is not used.

78.17.129 MAC Layer 3 Address 3 Reg 0 (MAC_Layer3_Addr3_Reg0)

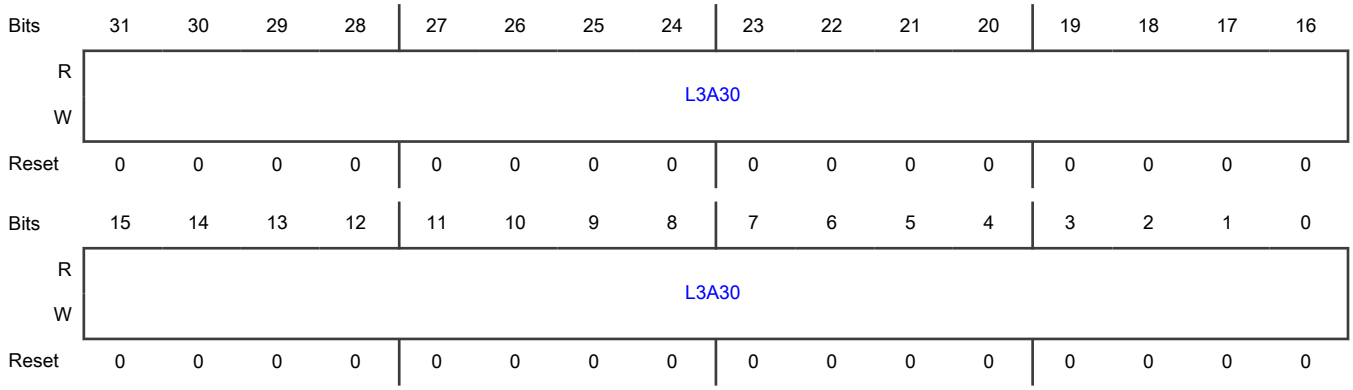
Offset

Register	Offset
MAC_Layer3_Addr3_Reg0	91Ch

Function

Contains the 32-bit IP destination address field for IPv4 packets. For IPv6 packets, the field contains bits [127:96] of the 128-bit IP source address or destination address field.

Diagram



Fields

Field	Function
31-0 L3A30	Layer 3 Address 3 Indicates layer 3 address 3. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3SAM0] are 1, this field contains the value to be matched with bits [127:96] of the IP source address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3DAM0] are 1, this field contains the value to be matched with bits [127:96] of the IP destination address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] = 0, this field is not used.

78.17.130 MAC L3 L4 Control 1 (MAC_L3_L4_Control1)

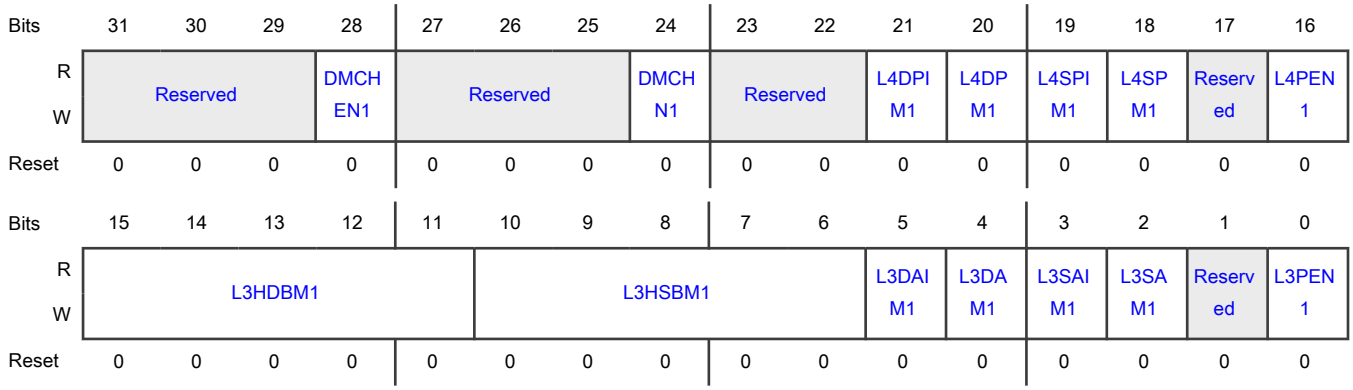
Offset

Register	Offset
MAC_L3_L4_Control1	930h

Function

Controls the filter 0 operations of the layer 3 and layer 4 protocols.

Diagram



Fields

Field	Function
31-29 —	Reserved
28 DMCHEN1	DMA Channel Select Enable 1 Indicates the status of the DMA channel number. • If this field is 1, it enables the selection of the DMA channel number for the packet that the L3_L4 filter passes. The DMCHN fields indicate the DMA channel number. • If this field is 0, the filter does not decide the DMA channel number. 0b - Disabled 1b - Enabled
27-25 —	Reserved
24 DMCHN1	DMA Channel Number 1 Indicates the DMA channel number. If the value of the DMCHEN fields is 1, this field selects the DMA channel number to which the packet that this filter passes is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM1	Layer 4 Destination Port Inverse Match Enable 1 Indicates the status of layer 4 destination port inverse matching. • If this field is 1, MAC_Layer4_Address0[L4DP0] is enabled for inverse matching. • If this field is 0, MAC_Layer4_Address0[L4DP0] is enabled for perfect matching. This field is valid and applicable only when the L4DPM0 field is 1.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
20 L4DPM1	Layer 4 Destination Port Match Enable 1 Indicates the status of layer 4 destination port matching. • If this field is 1, MAC_Layer4_Address0[L4DP0] is enabled for matching. • If this field is 0, MAC ignores MAC_Layer4_Address0[L4DP0] for matching. 0b - Disabled 1b - Enabled
19 L4SPIM1	Layer 4 Source Port Inverse Match Enable 1 Indicates the status of layer 4 source port inverse matching. • If this field is 1, MAC_Layer4_Address0[L4SP0] is enabled for inverse matching. • If this field is 0, MAC_Layer4_Address0[L4SP0] is enabled for perfect matching. This field is valid and applicable only when MAC_Layer4_Address0[L4SP0] = 1. 0b - Disabled 1b - Enabled
18 L4SPM1	Layer 4 Source Port Match Enable 1 Indicates the status of layer 4 source port matching. • If this field is 1, MAC_Layer4_Address0[L4SP0] is enabled for matching. • If this field is 0, MAC ignores MAC_Layer4_Address0[L4SP0] for matching. 0b - Disabled 1b - Enabled
17 —	Reserved
16 L4PEN1	Layer 4 Protocol Enable 1 Indicates the status of layer 4 protocol. • If this field is 1, MAC_Layer4_Address0[L4SP0] and MAC_Layer4_Address0[L4DP0] of UDP packets are used for matching. • If this field is 0, MAC_Layer4_Address0[L4SP0] and MAC_Layer4_Address0[L4DP0] of TCP packets are used for matching. Layer 4 matching is performed only when the L4SPM0 field or the L4DPM0 field is 1. 0b - Disabled 1b - Enabled

	• If this field is 1, layer 3 IP DA is enabled for inverse matching. • If this field is 0, layer 3 IP DA is enabled for perfect matching. This field is valid and applicable only if MAC_L3_L4_Control0[L3DAM0] = 1. 0b - Disabled 1b - Enabled
4 L3DAM1	Layer 3 IP DA Match Enable 1 Indicates the status of layer 3 IP DA matching. • If this field is 1, layer 3 IP DA is enabled for matching. • If this field is 0, MAC ignores layer 3 IP DA for matching. **NOTE** If MAC_L3_L4_Control0[L3PEN0] = 1, you must write 1 to either this field or to MAC_L3_L4_Control0[L3SAM0] because either the IPv6 DA or SA can be checked for filtering. 0b - Disabled 1b - Enabled
3 L3SAIM1	Layer 3 IP SA Inverse Match Enable 1 Indicates the status of layer 3 IP SA inverse matching. • If this field is 1, layer 3 IP SA is enabled for inverse matching. • If this field is 0, layer 3 IP SA is enabled for perfect matching. This field is valid and applicable only if MAC_L3_L4_Control0[L3SAM0] is 1. 0b - Disabled 1b - Enabled
2 L3SAM1	Layer 3 IP SA Match Enable 1 Indicates the status of layer 3 IP SA matching. • If this field is 1, layer 3 IP SA matching is enabled. • If this field is 0, MAC ignores layer 3 IP SA matching. **NOTE** If MAC_L3_L4_Control0[L3PEN0] = 1, you must write 1 to either this field or to MAC_L3_L4_Control0[L3DAM0] because either IPv6 SA or DA can be checked for filtering. 0b - Disabled 1b - Enabled
1 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
0 L3PEN1	Layer 3 Protocol Enable 1 Indicates the status of layer 3 protocol. • If this field is 1, the layer 3 IP SA or DA matching is enabled for IPv6 packets. • If this field is 0, the layer 3 IP SA or DA matching is enabled for IPv4 packets. The layer 3 matching is performed only when either MAC_L3_L4_Control0[L3SAM0] or MAC_L3_L4_Control0[L3DAM0] is 1. 0b - Disabled 1b - Enabled

78.17.131 MAC Layer 4 Address 1 (MAC_Layer4_Address1)

Offset

Register	Offset
MAC_Layer4_Address1	934h

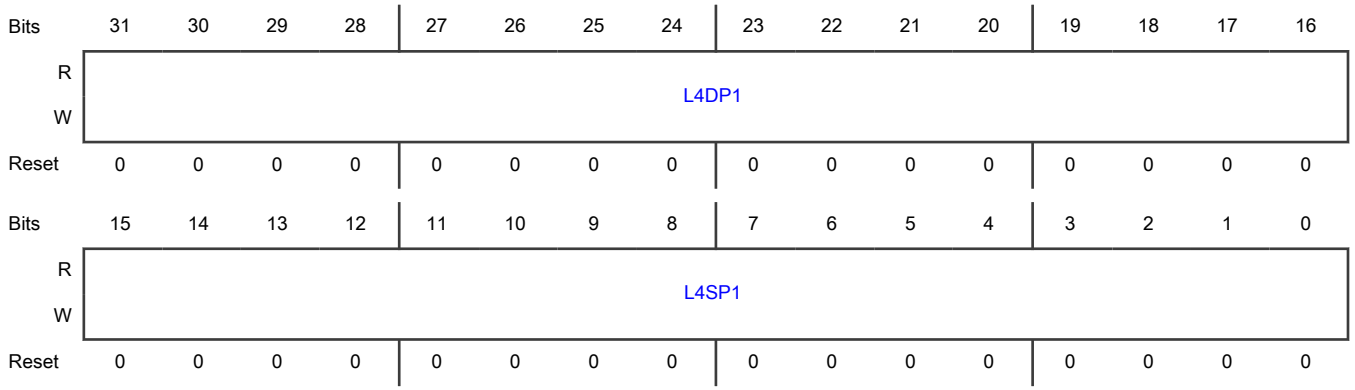
Function

Provides the layer 4 source and destination port numbers.

MAC Layer 4 Address 1 (MAC_Layer4_Address1), MAC L3 L4 Control 1 (MAC_L3_L4_Control1), MAC Layer 3 Address 0 Reg 1 (MAC_Layer3_Addr0_Reg1), MAC Layer 3 Address 1 Reg 1 (MAC_Layer3_Addr1_Reg1), MAC Layer 3 Address 2 Reg 1 (MAC_Layer3_Addr2_Reg1), and MAC Layer 3 Address 3 Reg 1 (MAC_Layer3_Addr3_Reg1) are reserved registers (RO with a default value) if the enable layer 3 and layer 4 packet filter option is not selected when configuring the core.

You can configure the layer 3 and layer 4 address registers to be double-synchronized by selecting the synchronize layer 3 and layer 4 address registers to the receive clock domain option while configuring the core. When you select this option, the synchronization is triggered only when bits [31:24] (in Little-Endian mode) or bits [7:0] (in Big-Endian mode) of the layer 3 and layer 4 address registers are written to. For proper synchronization updates, you must perform consecutive writes to the same layer 3 and layer 4 address registers after a delay of at least four destination clock cycles.

Diagram



Fields

Field	Function
31-16 L4DP1	Layer 4 Destination Port Number 1 Indicates layer 4 destination port number. If MAC_L3_L4_Control0[L4PEN0] = 0 and MAC_L3_L4_Control0[L4DPM0] = 1, this field contains the value to be matched with the TCP destination port number field in the IPv4 or IPv6 packets. If MAC_L3_L4_Control0[L4PEN0] and MAC_L3_L4_Control0[L4DPM0] are 1, this field contains the value to be matched with the UDP destination port number field in the IPv4 or IPv6 packets.
15-0 L4SP1	Layer 4 Source Port Number 1 Indicates layer 4 source port number. If MAC_L3_L4_Control0[L4PEN0] = 0 and MAC_L3_L4_Control0[L4SPM0] = 1, this field contains the value to be matched with the TCP source port number field in the IPv4 or IPv6 packets. If MAC_L3_L4_Control0[L4PEN0] and MAC_L3_L4_Control0[L4SPM0] are 1, this field contains the value to be matched with the UDP source port number field in the IPv4 or IPv6 packets.

78.17.132 MAC Layer 3 Address 0 Reg 1 (MAC_Layer3_Addr0_Reg1)

Offset

Register	Offset
MAC_Layer3_Addr0_Reg1	940h

Function

Contains the 32-bit IP source address field for IPv4 packets. For IPv6 packets, the field contains bits [31:0] of the 128-bit IP source address or destination address field.

Diagram

Field	Function
0 L3PEN2	Layer 3 Protocol Enable 2 Indicates the status of layer 3 protocol. • If this field is 1, the layer 3 IP SA or DA matching is enabled for IPv6 packets. • If this field is 0, the layer 3 IP SA or DA matching is enabled for IPv4 packets. The layer 3 matching is performed only when either MAC_L3_L4_Control0[L3SAM0] or MAC_L3_L4_Control0[L3DAM0] is 1. 0b - Disabled 1b - Enabled

78.17.137 MAC Layer 4 Address 2 (MAC_Layer4_Address2)

Offset

Register	Offset
MAC_Layer4_Address2	964h

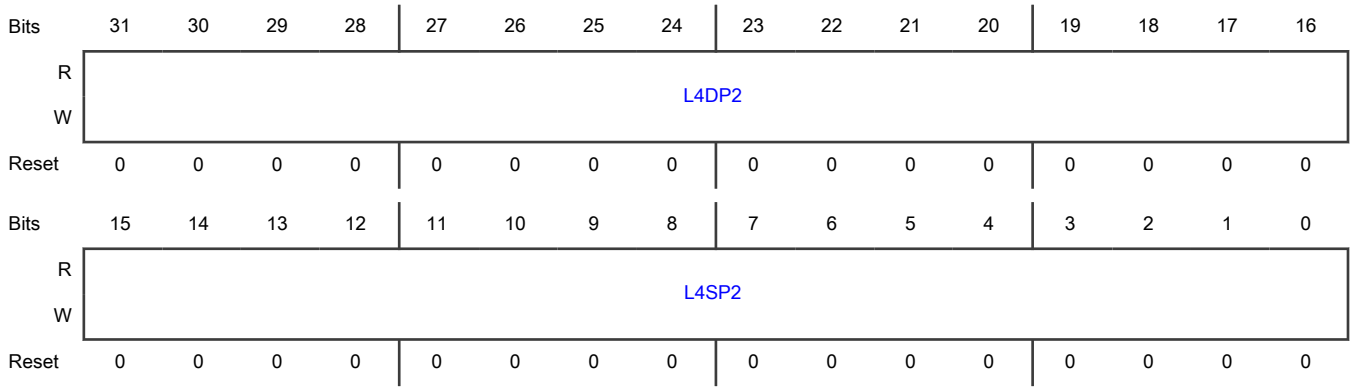
Function

Provides the layer 4 source and destination port numbers.

MAC Layer 4 Address 1 (MAC_Layer4_Address1), MAC L3 L4 Control 1 (MAC_L3_L4_Control1), MAC Layer 3 Address 0 Reg 1 (MAC_Layer3_Addr0_Reg1), MAC Layer 3 Address 1 Reg 1 (MAC_Layer3_Addr1_Reg1), MAC Layer 3 Address 2 Reg 1 (MAC_Layer3_Addr2_Reg1), and MAC Layer 3 Address 3 Reg 1 (MAC_Layer3_Addr3_Reg1) are reserved registers (RO with a default value) if the enable layer 3 and layer 4 packet filter option is not selected when configuring the core.

You can configure the layer 3 and layer 4 address registers to be double-synchronized by selecting the synchronize layer 3 and layer 4 address registers to the receive clock domain option while configuring the core. When you select this option, the synchronization is triggered only when bits [31:24] (in Little-Endian mode) or bits [7:0] (in Big-Endian mode) of the layer 3 and layer 4 address registers are written to. For proper synchronization updates, you must perform consecutive writes to the same layer 3 and layer 4 address registers after a delay of at least four destination clock cycles.

Diagram



Fields

Field	Function
31-16 L4DP2	Layer 4 Destination Port Number 2 Indicates layer 4 destination port number. If MAC_L3_L4_Control0[L4PEN0] = 0 and MAC_L3_L4_Control0[L4DPM0] = 1, this field contains the value to be matched with the TCP destination port number field in the IPv4 or IPv6 packets. If MAC_L3_L4_Control0[L4PEN0] and MAC_L3_L4_Control0[L4DPM0] are 1, this field contains the value to be matched with the UDP destination port number field in the IPv4 or IPv6 packets.
15-0 L4SP2	Layer 4 Source Port Number 2 Indicates layer 4 source port number. If MAC_L3_L4_Control0[L4PEN0] = 0 and MAC_L3_L4_Control0[L4SPM0] = 1, this field contains the value to be matched with the TCP source port number field in the IPv4 or IPv6 packets. If MAC_L3_L4_Control0[L4PEN0] and MAC_L3_L4_Control0[L4SPM0] are 1, this field contains the value to be matched with the UDP source port number field in the IPv4 or IPv6 packets.

78.17.138 MAC Layer 3 Address 0 Reg 2 (MAC_Layer3_Addr0_Reg2)

Offset

Register	Offset
MAC_Layer3_Addr0_Reg2	970h

Function

Contains the 32-bit IP source address field for IPv4 packets. For IPv6 packets, the field contains bits [31:0] of the 128-bit IP source address or destination address field.

Diagram

Fields

Field	Function
31-0 L3A33	Layer 3 Address 3 Indicates layer 3 address 3. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3SAM0] are 1, this field contains the value to be matched with bits [127:96] of the IP source address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] and MAC_L3_L4_Control0[L3DAM0] are 1, this field contains the value to be matched with bits [127:96] of the IP destination address field in the IPv6 packets. • If MAC_L3_L4_Control0[L3PEN0] = 0, this field is not used.

78.17.148 MAC Timestamp Control (MAC_Timestamp_Control)

Offset

Register	Offset
MAC_Timestamp_Control	B00h

Function

Controls the operation of the system time generator and processing of PTP packets for timestamping in the receiver.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-29 —	Reserved
28 AV8021ASMEN	AV 802.1AS Mode Enable Indicates the status of AV 802.1AS mode. If this field is 1, MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, which means using the IEEE 802.1AS mode of operation. If MAC_HW_Feature1[PTOEN] = 1, for the purpose of PTP offload, the transport-specific field in the PTP header is generated and checked based on the value of the AV8021ASMEN field. 0b - Disabled 1b - Enabled
27-25 —	Reserved
24 TXTSSTSM	Transmit Timestamp Status Mode Indicates the status of transmit timestamp status mode. • If this field is 1, MAC overwrites the previous transmit timestamp status even if the software does not read it. MAC indicates this by writing 1 to MAC_Tx_Timestamp_Status_Nanoseconds[TXTSSMIS]. • If this field is 0, MAC ignores the timestamp status of the current packet if the software does not read the timestamp status of the previous packet. MAC indicates this by writing 1 to MAC_Tx_Timestamp_Status_Nanoseconds[TXTSSMIS]. 0b - Disabled 1b - Enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
23-21 —	Reserved
20 ESTI	External System Time Input Indicates the status of external system time input. If this field is 1, MAC uses the external 64-bit reference system time input for these functions: • To consider the timestamp provided as status • To insert the timestamp in transmit PTP packets if the one-step timestamp or the timestamp offload feature is enabled If this field is 1, MAC uses the internal reference system time. 0b - Disabled 1b - Enabled
19 —	Reserved
18 TSENMACADDR	Enable MAC Address For PTP Packet Filtering Indicates whether the MAC address for PTP packet filtering is enabled. If this field is 1, the DA MAC address, which matches any MAC Address register, is used to filter the PTP packets when PTP is directly sent over Ethernet. If this field is 1, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in the MAC address registers are considered for processing when PTP is directly sent over Ethernet. • For a normal time stamping operation, MAC address registers 0 to 31 are considered for unicast destination address matching. • For PTP offload, only MAC address register 0 is considered for unicast destination address matching. 0b - Disabled 1b - Enabled
17-16 SNAPTYPSEL	Select PTP Packets For Taking Snapshots Determines the set of PTP packet types for which a snapshot needs to be taken. This field, along with the TSEVNTENA and TSMSTRENA fields, determines the set of PTP packet types for which a snapshot needs to be taken. See Receive path functions for encoding.
15 TSMSTRENA	Enable Snapshot For Messages Relevant To Master Indicates whether the snapshot for messages relevant to master is enabled. If this field is 1, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
14 TSEVNTENA	Enable Timestamp Snapshot For Event Messages Enables or disables timestamp snapshot for event messages. If this field is 1, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When the field becomes 0, the snapshot is taken for all the messages except Announce, Management, and Signaling. For more information on timestamp snapshot dependency on register bits, see Receive path functions. 0b - Disabled 1b - Enabled
13 TSIPV4ENA	Enable Processing Of PTP Packets Sent Over IPv4-UDP Indicates whether the processing of PTP packets sent over IPv4-UDP is enabled. If this field is 1, the MAC receiver processes the PTP packets encapsulated in the IPv4-UDP packets. When this field becomes 0, MAC ignores the PTP transported over the IPv4-UDP packets. The default value of this field is 1. 0b - Disabled 1b - Enabled
12 TSIPV6ENA	Enable Processing Of PTP Packets Sent Over IPv6-UDP Indicates whether the processing of PTP packets sent over IPv6-UDP is enabled. If this field is 1, the MAC receiver processes the PTP packets encapsulated in the IPv6-UDP packets. If the value is 0, MAC ignores the PTP transported over IPv6-UDP packets. 0b - Disabled 1b - Enabled
11 TSIPENA	Enable Processing Of PTP Over Ethernet Packets Indicates the status of PTP processing over Ethernet packets. If this field is 1, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When the field becomes 0, MAC ignores the PTP over Ethernet packets. 0b - Disabled 1b - Enabled
10 TSVER2ENA	Enable PTP Packet Processing For Version 2 Format Indicates the status of PTP packet processing for version 2 format. If this field is 1, the IEEE 1588 version 2 format is used to process the PTP packets. When this field becomes 0, the IEEE 1588 version 1 format is used to process the PTP packets. See PTP processing and control for more information on the IEEE 1588 formats.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
9 TSCTRLSSR	Timestamp Digital Or Binary Rollover Control Indicates the status of timestamp digital or binary rollover control. • If this field is 1, the Timestamp Low register rolls over after the 3B9A_C9FFh value (that is, 1 nanosecond accuracy) and increments the timestamp (high) seconds. • If this field is 0, the rollover value of the Subsecond register is 7FFF_FFFFh. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this field. 0b - Disabled 1b - Enabled
8 TSENALL	Enable Timestamp For All Packets Indicates the status of timestamp snapshot for all packets. If this field is 1, the timestamp snapshot is enabled for all packets that MAC receives. 0b - Disabled 1b - Enabled
7 —	Reserved
6 PTGE	Presentation Time Generation Enable Indicates the status of presentation time generation. If this field is 1, the presentation time generation is enabled. 0b - Disabled 1b - Enabled
5 TSADDREG	Update Addend Register Indicates whether MAC Timestamp Addend (MAC_Timestamp_Addend) is updated. If this field is 1, the contents of MAC Timestamp Addend (MAC_Timestamp_Addend) are updated in the PTP block for fine correction. The field becomes 0 after the update completes. The value of the field must also be 0 before you write 1 to it. Access restrictions apply to this field that clears automatically. Writing 0 has no effect. 0b - Not updated 1b - Updated
4 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
3 TSUPDT	Update Timestamp Indicates whether the timestamp is updated. If this field is 1, the system time is updated (added or subtracted) with the value specified in MAC System Time Seconds Update (MAC_System_Time_Seconds_Update) and MAC System Time Nanoseconds Update (MAC_System_Time_Nanoseconds_Update). The value of this field must be 0 before you update it. It resets after the update is complete in hardware. MAC_System_Time_Higher_Word_Seconds[TSHWR], if enabled during core configuration, is not updated. When media clock generation and recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled, MAC Presentation Time Update (MAC_Presn_Time_Updt) must also be updated before you write 1 to this field. Access restrictions apply to this field that clears automatically. Writing 0 has no effect. 0b - Not updated 1b - Updated
2 TSINIT	Initialize Timestamp Indicates whether the timestamp is initialized. If this field is 1, the system time is initialized (overwritten) with the value specified in MAC System Time Seconds Update (MAC_System_Time_Seconds_Update) and MAC System Time Nanoseconds Update (MAC_System_Time_Nanoseconds_Update). The value of this field must be 0 before you update it, and the field is reset after the initialization is complete. MAC_System_Time_Higher_Word_Seconds[TSHWR], if enabled during core configuration, can only be initialized. When media clock generation and recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled, MAC Presentation Time Update (MAC_Presn_Time_Updt) must also be updated before you write 1 to this field. Access restrictions apply to this field that clears automatically. Writing 0 has no effect. 0b - Not initialized 1b - Initialized
1 TSCFUPDT	Fine Or Coarse Timestamp Update Indicates the method used to update system timestamp. • If this field is 1, the fine method is used to update system timestamp. • If this field is 0, the coarse method is used to update the system timestamp. 0b - Coarse method 1b - Fine method
0 TSENA	Timestamp Enable Enables or disables timestamp for transmit and receive packets.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• If this field is 1, the timestamp is added for transmit and receive packets. • If this field is 0, timestamp is not added for transmit and receive packets and the timestamp generator is also suspended. You need to initialize the timestamp (system time) after enabling this mode. On the receive side, MAC processes the 1588 packets only if this field is 1. 0b - Disabled 1b - Enabled

78.17.149 MAC Sub Second Increment (MAC_Sub_Second_Increment)

Offset

Register	Offset
MAC_Sub_Second_Increment	B04h

Function

Specifies the value to be added to the internal system time register at every cycle of the clk_ptp_ref_i clock.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved								SSINC							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SNSINC								Reserved							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-24 —	Reserved
23-16 SSINC	Sub-Second Increment Value

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Contains the sub-second increment value, which accumulates every clock cycle (of clk_ptp_i) with the contents of the Subsecond register. For example, if the PTP clock is 50 MHz (period is 20 ns), you must program 20 (14h) when MAC System Time In Nanoseconds (MAC_System_Time_Nanoseconds) has an accuracy of 1 ns (MAC_Timestamp_Control[TSCTRLSSR] = 1). When TSCTRLSSR = 0, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you must program a value of 43 (2Bh), which is derived by 20 ns/0.465.
15-8 SNSINC	Sub-Nanosecond Increment Value Contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. This value is accumulated in the sub-nanoseconds field of the Subsecond register. For example, if MAC_Timestamp_Control[TSCTRLSSR] = 1, and if the required increment is 5.3 ns, then this field must be 4Ch and the SSINC field must be 05h.
7-0 —	Reserved

78.17.150 MAC System Time In Seconds (MAC_System_Time_Seconds)

Offset

Register	Offset
MAC_System_Time_Seconds	B08h

Function

Indicates, along with MAC System Time In Nanoseconds (MAC_System_Time_Nanoseconds), the current value of the system time that MAC maintains. Although it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to the CSR clock).

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	TSS															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TSS	Timestamp Second Indicates the current value, in seconds, of the system time that MAC maintains.

78.17.151 MAC System Time In Nanoseconds (MAC_System_Time_Nanoseconds)

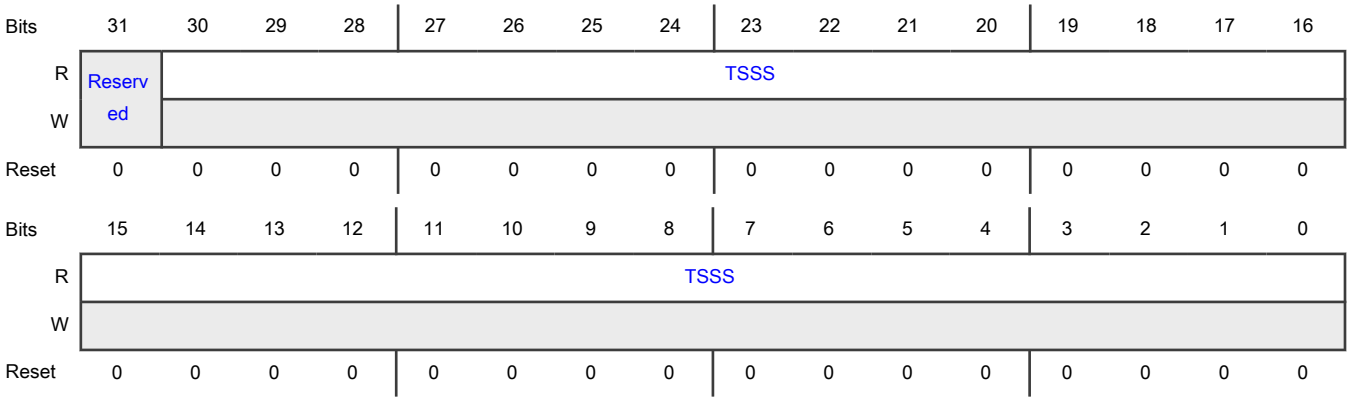
Offset

Register	Offset
MAC_System_Time_Nanoseconds	B0Ch

Function

Indicates, along with MAC System Time In Seconds (MAC_System_Time_Seconds), the current value of the system time that MAC maintains.

Diagram



Fields

Field	Function
31 —	Reserved
30-0 TSSS	Timestamp Sub Seconds Indicates the sub-second representation of time, with an accuracy of 0.46 ns. When MAC_Timestamp_Control[TSCTRLSSR] = 1, each bit represents 1 ns. The maximum value is 3B9A_C9FFh after which it rolls over to 0.

78.17.152 MAC System Time Seconds Update (MAC_System_Time_Seconds_Update)

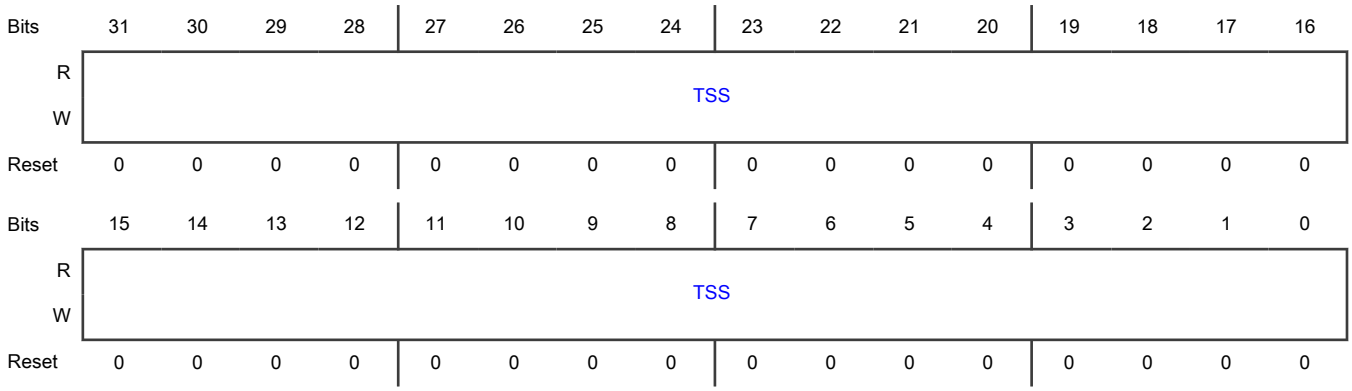
Offset

Register	Offset
MAC_System_Time_Seconds_Update	B10h

Function

Initializes or updates, along with MAC System Time Nanoseconds Update (MAC_System_Time_Nanoseconds_Update), the system time that MAC maintains. You must write both to this register and the MAC System Time Nanoseconds Update register before writing 1 to MAC_Timestamp_Control[TSINIT] and MAC_Timestamp_Control[TSUPDT].

Diagram



Fields

Field	Function
31-0 TSS	Timestamp Seconds Indicates the timestamp seconds value. The value in this field is the seconds part of the update. • If MAC_System_Time_Nanoseconds_Update[ADDSUB] = 0, this field must be programmed with the seconds part of the update value. • If MAC_System_Time_Nanoseconds_Update[ADDSUB] = 1, this field must be programmed with the complement of the seconds part of the update value. For example, if 2.000000001 seconds need to be subtracted from the system time, MAC_System_Time_Seconds[TSS] must be FFFF_FFFEh (that is, 2^32 - 2).

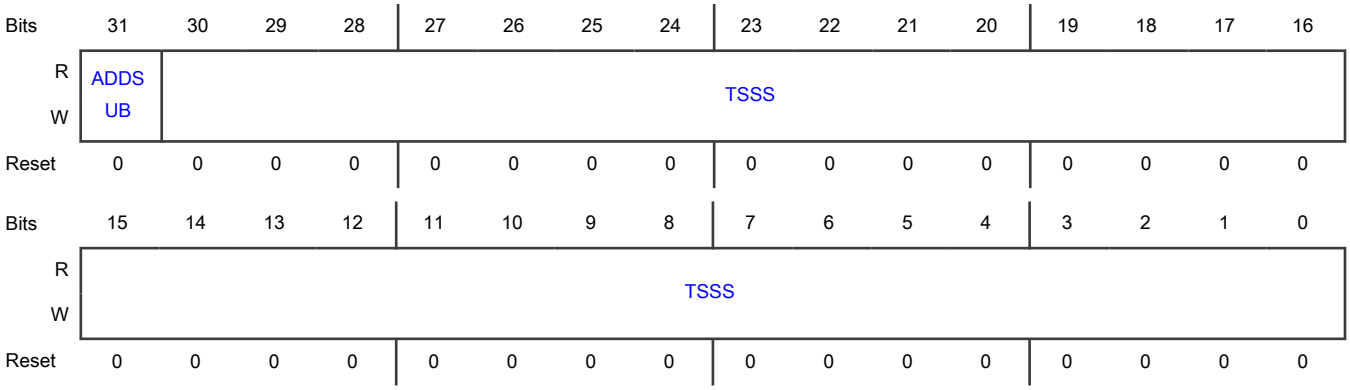
78.17.153 MAC System Time Nanoseconds Update (MAC_System_Time_Nanoseconds_Update)

Offset

Register	Offset
MAC_System_Time_Nanoseconds_Update	B14h

Function
Indicates system time nanoseconds update.

Diagram



Fields

Field	Function
31 ADDSUB	Add Or Subtract Time Indicates whether the time value is added or subtracted from the contents of the update register. • If this field is 1, the time value is subtracted from the contents of the update register. • If this field is 0, the time value is added to the contents of the update register. 0b - Add time 1b - Subtract time
30-0 TSSS	Timestamp Subseconds Indicates the sub-second part of the update. • If ADDSUB = 0, this field must be programmed with the sub-second part of the update value, with an accuracy based on MAC_Timestamp_Control[TSCTRLSSR]. • If ADDSUB = 0, this field must be programmed with the complement of the sub-second part of the update value as described below. • If MAC_Timestamp_Control[TSCTRLSSR] = 1, the programmed value must be 10^9 - <sub-second value>, and if MAC_Timestamp_Control[TSCTRLSSR] = 0, the programmed value must be 2^31 - <sub-second_value>.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• If MAC_Timestamp_Control[TSCTRLSSR] = 0, each bit of it represents an accuracy of 0.46 ns, and if MAC_Timestamp_Control[TSCTRLSSR] = 1, each bit represents 1 ns and the programmed value must not exceed 3B9A_C9FFh. For example, if 2.000000001 seconds need to be subtracted from the system time, this field must be 7FFF_FFFFh (that is, 2^31 - 1) if MAC_Timestamp_Control[TSCTRLSSR] = 0. This field must be 3B9A_C9FFh (that is, 10^9 - 1) if MAC_Timestamp_Control[TSCTRLSSR] = 1.

78.17.154 MAC Timestamp Addend (MAC_Timestamp_Addend)

Offset

Register	Offset
MAC_Timestamp_Addend	B18h

Function

Is used only when the system time is configured for Fine Update mode (MAC_Timestamp_Control[TSINIT] = 1). The contents of this register are added to a 32-bit accumulator in every clock cycle (of clk_ptp_ref_i), and the system time is updated whenever the accumulator overflows.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TSAR															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TSAR	Timestamp Addend Register Indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

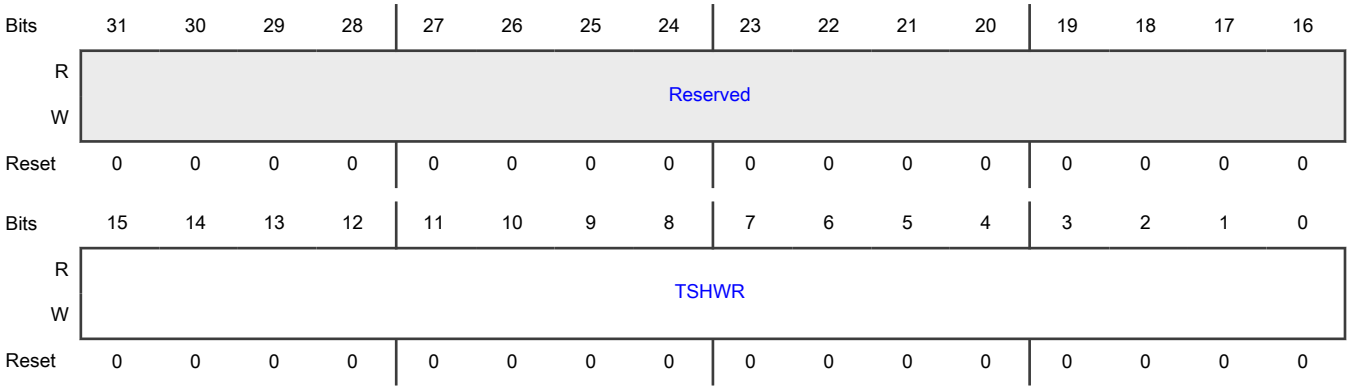
78.17.155 MAC System Time Higher Word In Seconds (MAC_System_Time_Higher_Word_Seconds)

Offset

Register	Offset
MAC_System_Time_Higher_Word_Seconds	B1Ch

Function
Indicates system time - higher word in seconds.

Diagram



Fields

Field	Function
31-16 —	Reserved
15-0 TSHWR	Timestamp Higher Word Register Contains the most-significant 16 bits of the timestamp seconds value. This register is optional, and you can add it if you select the IEEE 1588 higher-word register option. You write to this register directly to initialize the value, which increments when there is an overflow from the 32 bits of MAC System Time In Seconds (MAC_System_Time_Seconds). Access restrictions apply to this field, which updates based on an event occurrence.

78.17.156 MAC Timestamp Status (MAC_Timestamp_Status)

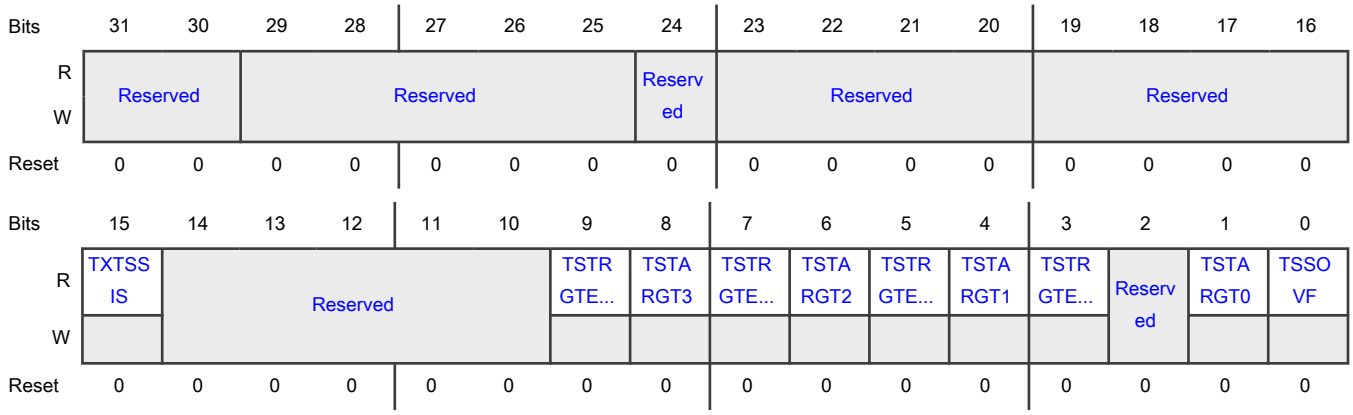
Offset

Register	Offset
MAC_Timestamp_Status	B20h

Function

Indicates timestamp status. All the bits except [27:25] are cleared when the application reads this register.

Diagram



Fields

Field	Function
31-30 —	Reserved
29-25 —	Reserved
24 —	Reserved
23-20 —	Reserved
19-16 —	Reserved
15 TXTSSIS	Transmit Timestamp Status Interrupt Status Indicates whether the transmit timestamp interrupt status is detected. In non-EQOS_CORE configurations, if the drop transmit status is enabled in MTL, this field becomes 1 when the captured transmit timestamp is updated in MAC Transmit Timestamp Status In Seconds (MAC_Tx_Timestamp_Status_Seconds) and MAC Transmit Timestamp Status In Nanoseconds (MAC_Tx_Timestamp_Status_Nanoseconds). If MAC_HW_Feature1[PTOEN] = 1, TXTSSIS becomes 1 when the captured transmit timestamp is updated in MAC Transmit Timestamp Status In Seconds (MAC_Tx_Timestamp_Status_Seconds) and MAC Transmit Timestamp Status In Nanoseconds (MAC_Tx_Timestamp_Status_Nanoseconds) for PTO-generated delay request and Pdelay request packets.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field becomes 0 if you read or write to MAC Transmit Timestamp Status In Seconds (MAC_Tx_Timestamp_Status_Seconds) when MAC_CSR_SW_Ctrl[RCWE] = 1. 0b - Not detected 1b - Detected
14-10 —	Reserved
9 TSTRGTERR3	Timestamp Target Time Error Indicates whether the timestamp target time error status is detected. This field becomes 1 if the latest target time programmed in MAC PPS3 Target Time In Seconds (MAC_PPS3_Target_Time_Seconds) and MAC PPS3 Target Time In Nanoseconds (MAC_PPS3_Target_Time_Nanoseconds) elapses. The field becomes 0 when the application reads it. Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
8 TSTARGT3	Timestamp Target Time Reached For Target Time PPS3 Indicates whether the timestamp target time reached for target time PPS3 status is detected. If this field is 1, it indicates that the value of the system time is greater than or equal to the value specified in MAC PPS3 Target Time In Seconds (MAC_PPS3_Target_Time_Seconds) and MAC PPS3 Target Time In Nanoseconds (MAC_PPS3_Target_Time_Nanoseconds). Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
7 TSTRGTERR2	Timestamp Target Time Error Indicates whether the timestamp target time error status is detected. This field becomes 1 when the latest target time programmed in MAC PPS2 Target Time In Seconds (MAC_PPS2_Target_Time_Seconds) and MAC PPS2 Target Time In Nanoseconds (MAC_PPS2_Target_Time_Nanoseconds) elapses. The field becomes 0 when the application reads it. Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
6 TSTARGT2	Timestamp Target Time Reached For Target Time PPS2 Indicates whether the timestamp target time reached for the target time PPS2 status is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	If this field is 1, it indicates that the value of system time is greater than or equal to the value specified in MAC PPS2 Target Time In Seconds (MAC_PPS2_Target_Time_Seconds) and MAC PPS2 Target Time In Nanoseconds (MAC_PPS2_Target_Time_Nanoseconds). Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
5 TSTRGTERR1	Timestamp Target Time Error Indicates whether the timestamp target time error status is detected. This field becomes 1 when the latest target time programmed in MAC PPS1 Target Time In Seconds (MAC_PPS1_Target_Time_Seconds) and MAC PPS1 Target Time In Nanoseconds (MAC_PPS1_Target_Time_Nanoseconds) elapses. The field becomes 0 when the application reads it. Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
4 TSTARGT1	Timestamp Target Time Reached For Target Time PPS1 Indicates whether the timestamp target time reached for target time PPS1 status is detected. If this field is 1, it indicates that the value of system time is greater than or equal to the value specified in MAC PPS1 Target Time In Seconds (MAC_PPS1_Target_Time_Seconds) and MAC PPS1 Target Time In Nanoseconds (MAC_PPS1_Target_Time_Nanoseconds) Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
3 TSTRGTERR0	Timestamp Target Time Error Indicates whether the timestamp target time error status is detected. This field becomes 1 when the latest target time programmed in MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds) and MAC PPS0 Target Time In Nanoseconds (MAC_PPS0_Target_Time_Nanoseconds) elapses. The field becomes 0 when the application reads it. Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
2 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
1 TSTARGT0	Timestamp Target Time Reached Indicates whether the timestamp target time reached status is detected. If this field is 1, it indicates that the value of the system time is greater than or equal to the value specified in MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds) and MAC PPS0 Target Time In Nanoseconds (MAC_PPS0_Target_Time_Nanoseconds) Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
0 TSSOVF	Timestamp Seconds Overflow Indicates whether the timestamp seconds overflow status is detected. If this field is 1, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restrictions apply to this field that clears when read (or when this field is written to 1 if MAC_CSR_SW_Ctrl[RCWE] = 1). Also, the field automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected

78.17.157 MAC Transmit Timestamp Status In Nanoseconds (MAC_Tx_Timestamp_Status_Nanoseconds)

Offset

Register	Offset
MAC_Tx_Timestamp_Status_Nanoseconds	B30h

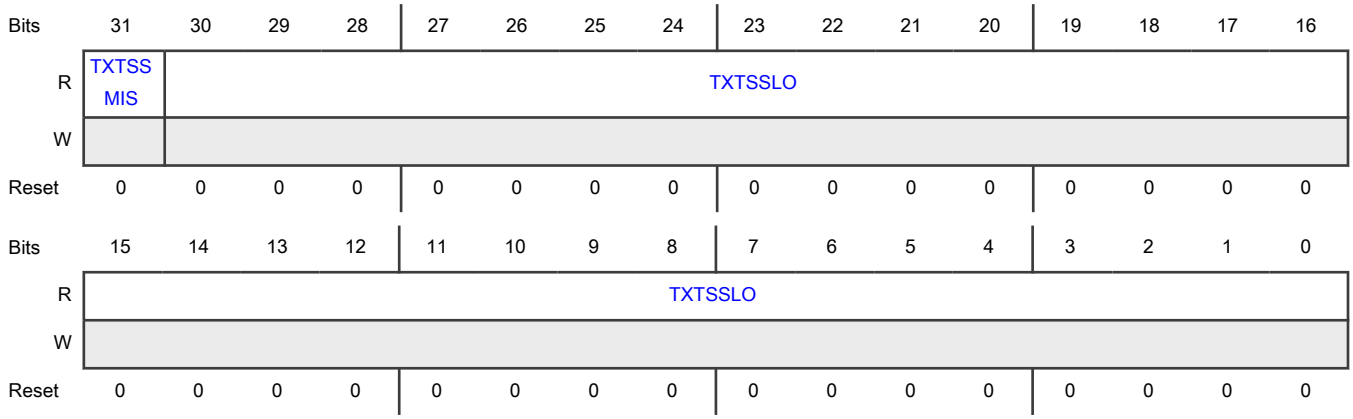
Function

Contains the nanosecond part of the timestamp captured for tansmit packets when the transmit status is disabled.

This register, along with MAC Transmit Timestamp Status In Seconds (MAC_Tx_Timestamp_Status_Seconds), gives the 64-bit timestamp captured for the PTP packet that MAC successfully transmits. The application considers reading this value after the last byte of this register is read. In Little-Endian mode, this means when bits [31:24] are read, and in Big-Endian mode, this means when bits [7:0] are read.

If the application does not read these registers and the timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the settings specified in MAC_Timestamp_Control[TXTSSTSM]. The status bit TXTSC bit [15] in the MAC_Timestamp_Status register is set whenever the MAC transmitter captures the timestamp.

Diagram



Fields

Field	Function
31 TXTSSMIS	Transmit Timestamp Status Missed Indicates whether the transmit timestamp missed status is detected. If this field is 1, it indicates one of these conditions: • The timestamp of the current packet is ignored if MAC_Timestamp_Control[TXTSSTSM] = 0. • The timestamp of the previous packet is overwritten with the timestamp of the current packet if MAC_Timestamp_Control[TXTSSTSM] = 1. Access restrictions apply to this field that cleas on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
30-0 TXTSSLO	Transmit Timestamp Status Low Contains 31 bits of the Nanoseconds field of the transmit packet's captured timestamp.

78.17.158 MAC Transmit Timestamp Status In Seconds (MAC_Tx_Timestamp_Status_Seconds)

Offset

Register	Offset
MAC_Tx_Timestamp_Status_Seconds	B34h

Function

Contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	TXTSSHI															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TXTSSHI	Transmit Timestamp Status High Contains the lower 32 bits of the Seconds field of the transmitted packet's captured timestamp.

78.17.159 MAC Timestamp Ingress Asymmetry Correction (MAC_Timestamp_Ingress_Asym_Corr)

Offset

Register	Offset
MAC_Timestamp_Ingress_Asym_Corr	B50h

Function

Contains the ingress asymmetry correction value to be used when updating the correction field in the PDelay_Resp PTP messages.

Diagram

Fields

Field	Function
31-0 OSTIAC	One-Step Timestamp Ingress Asymmetry Correction Contains the ingress path asymmetry value to be added to the correctionField of the Pdelay_Resp PTP packet. The programmed value must be expressed in units of nanoseconds and multiplied by 2^16. For example, 2.5 ns is represented as 00028000h. This value can also be negative, which is represented in the two's-complement form with bit 31 representing the sign bit.

78.17.160 MAC Timestamp Egress Asymmetry Correction (MAC_Timestamp_Egress_Asym_Corr)

Offset

Register	Offset
MAC_Timestamp_Egress_Asym_Corr	B54h

Function
Contains the egress asymmetry correction value to be used when updating the correction field in the PDelay_Req PTP messages.

R W	OSTEAC															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 OSTEAC	One-Step Timestamp Egress Asymmetry Correction Contains the egress path asymmetry value to be subtracted from the correctionField of the Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^16. For example, if the required correction is +2.5 ns, the programmed value must be FFFD_8000h, which is the two's-complement of 0002_8000h (2.5 * 216). Similarly, if the required correction is -3.3 ns, the programmed value is 0003_4CCCh (3.3 * 216).

78.17.161 MAC Timestamp Ingress Correction In Nanoseconds (MAC_Timestamp_Ingress_Corr_Nanosecond)

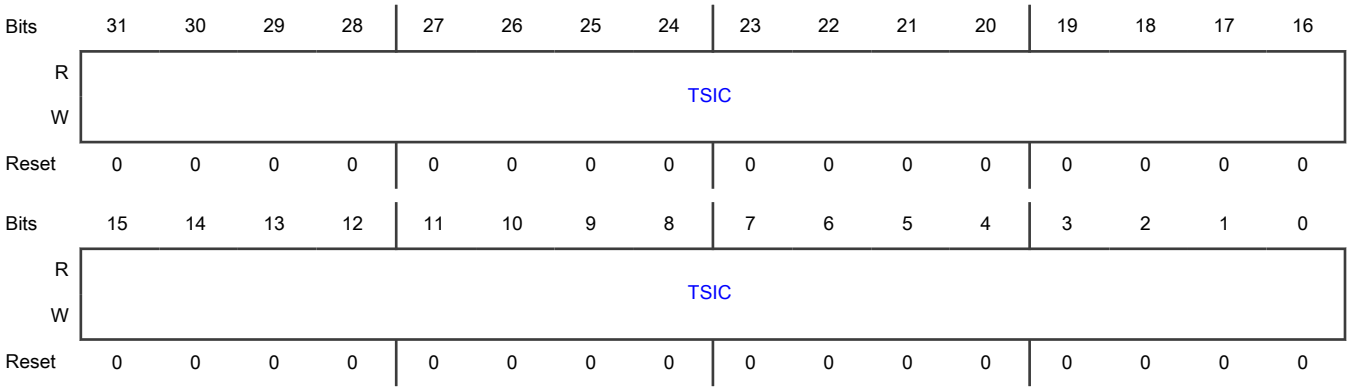
Offset

Register	Offset
MAC_Timestamp_Ingress_Corr_Nanosecond	B58h

Function

Contains the correction value, in nanoseconds, to be used with the captured timestamp value in the ingress path.

Diagram



Fields

Field	Function
31-0 TSIC	Timestamp Ingress Correction Contains the ingress path correction value as defined by the ingress correction expression.

78.17.162 MAC Timestamp Egress Correction In Nanoseconds (MAC_Timestamp_Egress_Corr_Nanosecond)

Offset

Register	Offset
MAC_Timestamp_Egress_Corr_Nanosecond	B5Ch

Function

Contains the correction value, in nanoseconds, to be used with the captured timestamp value in the egress path.

Fields

Field	Function
31 MCGREN3	MCGR Mode Enable For PPS3 Output Enables the third PPS instance to operate in PPS or MCGR mode. If this field is 1, it operates in MCGR mode, and if the value is 0, it operates in PPS mode.
30-29 TRGTMODSEL3	Target Time Register Mode For PPS3 Output Indicates MAC PPS3 Target Time In Seconds (MAC_PPS3_Target_Time_Seconds) and MAC PPS3 Target Time In Nanoseconds (MAC_PPS3_Target_Time_Nanoseconds) mode for the PPS3 output signal. 00b - Target Time registers are programmed only for generating the interrupt event. The flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port. 01b - Reserved 10b - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation. 11b - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
28 —	Reserved
27-24 PPSCMD3	Flexible PPS3 Output Control Controls the flexible PPS3 output (ptp_pps_o[3]) signal. The functioning of this field is similar to that of PPSCMD0[2:0] (presentation time control bits). If MCGREN3 = 1, PPSCMD3 that includes bits [27:24] are considered as presentation time control bits for media clock generation and recovery for comparator instance 3. If MCGREN3 is not 1, only three bits [26:24] are considered as PPSCMD3 and the fourth bit becomes 0. Access restrictions apply to this field that clears automatically. Writing 0 to it has no effect.
23 MCGREN2	MCGR Mode Enable For PPS2 Output Enables or disables the second PPS instance to operate in PPS or MCGR mode. If this field is 1, it operates in MCGR mode, and if the value is 0, it operates in PPS mode. 0b - Disabled 1b - Enabled
22-21 TRGTMODSEL2	Target Time Register Mode For PPS2 Output Indicates MAC PPS2 Target Time In Seconds (MAC_PPS2_Target_Time_Seconds) and MAC PPS2 Target Time In Nanoseconds (MAC_PPS2_Target_Time_Nanoseconds) mode for the PPS2 output signal. 00b - Target Time registers are programmed only for generating the interrupt event. The flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port. 01b - Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
	10b - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation. 11b - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
20 —	Reserved
19-16 PPSCMD2	Flexible PPS2 Output Control Controls the flexible PPS2 output (ptp_pps_o[2]) signal. The functioning of this field is similar to that of the PPSCMD0 (presentation time control bits). If MCGREN2 = 1, the bits included in PPSCMD2 [19:16] are considered as presentation time control bits for media clock generation and recovery for comparator instance 2. If MCGREN2 is not 1, only three bits [18:16] are used as PPSCMD2 and the fourth bit becomes 0. Access restrictions apply to this field that clears automatically. Writing 0 to it has no effect.
15 MCGREN1	MCGR Mode Enable For PPS1 Output Enables or disables the first PPS instance to operate in PPS or MCGR mode. If this field is 1, it operates in MCGR mode, and if the value is 0, it operates in PPS mode. 0b - Disabled 1b - Enabled
14-13 TRGTMODSEL1	Target Time Register Mode For PPS1 Output Indicates MAC PPS1 Target Time In Seconds (MAC_PPS1_Target_Time_Seconds) and MAC PPS1 Target Time In Nanoseconds (MAC_PPS1_Target_Time_Nanoseconds) mode for the PPS1 output signal. 00b - Target Time registers are programmed only for generating the interrupt event. The flexible PPS function must not be 1 in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port. 01b - Reserved 10b - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation. 11b - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
12 —	Reserved
11-8 PPSCMD1	Flexible PPS1 Output Control Controls the flexible PPS1 output (ptp_pps_o[1]) signal. The functioning of this field is similar to that of the PPSCMD0 field.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	If MCGREN1 = 1, the bits included in PPSCMD1 [11:8] are considered as presentation time control bits for media clock generation and recovery for comparator instance 1. The functioning of PPSCMD1 is similar to that of the PPSCMD0 presentation time control bits. If MCGREN1 is not 1, only three bits [10:8] are used as PPSCMD1 and the fourth bit becomes 0. Access restrictions apply to this field that clears automatically. Writing 0 to it has no effect.
7 MCGREN0	MCGR Mode Enable For PPS0 Output Indicates whether the 0th PPS instance is enabled to operate in PPS or MCGR mode. If this field is 1, it operates in MCGR mode, and if the value is 0, it operates in PPS mode. 0b - PPS mode 1b - MCGR mode
6-5 TRGTMODSEL0	Target Time Register Mode For PPS0 Output Indicates MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds) and MAC PPS0 Target Time In Nanoseconds (MAC_PPS0_Target_Time_Nanoseconds) mode for the PPS0 output signal. 00b - Target Time registers are programmed only for generating the interrupt event. The flexible PPS function must not be 1 in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port. 01b - Reserved 10b - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation. 11b - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
4 PPSEN0	Flexible PPS Output Mode Enable 0 Indicates the status of Flexible PPS Output mode. • If this field is 1, the PPSCTRL_PPSCMD field functions as PPSCMD. • If this field is 0, the PPSCTRL_PPSCMD field functions as PPSCTRL (fixed PPS mode). 0b - Disabled 1b - Enabled
3-0 PPSCTRL_PPSCMD	PPS Output Frequency Control Controls the frequency of the PPS0 output (ptp_pps_o[0] signal). The default value of this field is 0, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For the other values of PPSCTRL, the PPS output becomes a generated clock having these frequencies: • 0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. • 0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. • 0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. • 0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• .. • 1111: The binary rollover is 32.768 kHz and the digital rollover is 16.384 kHz. **NOTE** In Binary Rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In Digital Rollover mode, the PPS output frequency is an average number. The actual clock has a different frequency that is synchronized every second. For example, • If PPSCTRL = 0001, PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms. • If PPSCTRL = 0010, PPS (2 Hz) is a sequence of one clock of 50 percent duty cycle and a 537 ms period. The second clock has a period of 463 ms (268 ms low and 195 ms high). • If PPSCTRL = 0011, PPS (4 Hz) is a sequence of three clocks of 50 percent duty cycle and a 268 ms period, and the fourth clock of 195 ms period (134 ms low and 61 ms high). This behavior is a result of the non-linear toggling of bits in Digital Rollover mode in MAC System Time In Nanoseconds (MAC_System_Time_Nanoseconds) or flexible PPS output (ptp_pps_o[0]) control. Programming these bits with a non-zero value instructs MAC to initiate an event. When the command is transferred or synchronized with the PTP clock domain, these bits automatically become 0. You must ensure that these bits are programmed only when they are "all-zero." The following list describes the values of PPSCMD0. • 0000: No command • 0001: Start a single pulse. This command generates a single pulse rising at the start point defined in MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds) and MAC PPS0 Target Time In Nanoseconds (MAC_PPS0_Target_Time_Nanoseconds), for a duration defined in MAC PPS0 Width (MAC_PPS0_Width). • 0010: Start pulse train. This command generates the train of pulses rising at the start point defined in the Target Time registers and for a duration defined in MAC PPS0 Width (MAC_PPS0_Width), repeated at an interval defined in the PPS Interval registers. By default, the PPS pulse train runs freely unless the "stop pulse train at time" or "stop pulse train immediately" command stops it. • 0011: Cancel start. This command cancels the start single pulse and start pulse train commands if the system time has not crossed the programmed start time. • 0100: Stop pulse train at time. This command stops the train of pulses that the start pulse train command (PPSCMD = 0010) initiates after the time programmed in the Target Time registers elapses. • 0101: Stop pulse train immediately. This command immediately stops the train of pulses that the start pulse train command (PPSCMD = 0010) initiates. • 110: Cancel stop pulse train. This command cancels the stop pulse train at the time command if the programmed stop time has not elapsed. The PPS pulse train runs freely if the command executes successfully. • 0111-1111: Reserved or presentation time control. If MAC_PPS_Control[MCGREN0] = 0, then these are treated as presentation time control bits. This list describes the values of PPSCMD0:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• 0000: The MCGR operation is not carried out. If set to this value in the mid of clock recovery or generation, all the processing inputs are flushed. • 0001: Captures the presentation time at the rising edge of mcg_pst_trig_i[0] in MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds) • 0010: Captures the presentation time at the falling edge of mcg_pst_trig_i[0] in MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds) • 0011: Captures the presentation time at both the edges of mcg_pst_trig_i[0] in MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds) • 0100-1000: Reserved • 1001: Toggle output on compare • 1010: Pulse output low on compare for one PTP-clock cycle • 1011: Pulse output high on compare for one PTP-clock cycle • 1100-1111: Reserved

78.17.168 MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds)

Offset

Register	Offset
MAC_PPS0_Target_Time_Seconds	B80h

Function

Is used, along with the PPS Target Time Nanoseconds register, to schedule an interrupt event (MAC_Timestamp_Status[TSTARGT0]) when the system time exceeds the value programmed in these registers.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	TSTRH0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TSTRH0	PPS Target Time In Seconds Register Stores the target time in seconds. When the timestamp value matches or exceeds both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt (if enabled), based on Target Time mode selected for the corresponding PPS output in MAC PPS Control (MAC_PPS_Control). If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and MAC_Timestamp_Control[PTGE] = 1, with the presentation time control set in Recovery mode, these fields indicate that the application programs the TPT. In Generation mode, it indicates that CPT is generated at the sampled trigger.

78.17.169 MAC PPS0 Target Time In Nanoseconds (MAC_PPS0_Target_Time_Nanoseconds)

Offset

Register	Offset
MAC_PPS0_Target_Time_Nanoseconds	B84h

Function
Indicates the target time in nanoseconds for PPS0.

Diagram

Fields

Field	Function
31 TRGTBUSY0	PPS Target Time Busy Status 0 Indicates whether the PPS target time busy status 0 is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• MAC writes 1 to this field when MAC_PPS_Control[PPSCTRL_PPSCMD] is programmed to 010 or 011. This instructs MAC to synchronize the Target Time registers with the PTP clock domain. • MAC writes 0 to this field after synchronizing the Target Time registers with the PTP clock domain. The application must not update the Target Time registers when this field is read as 1. Otherwise, the synchronization of the previously programmed time is corrupted. 0b - Not detected 1b - Detected
30-0 TTSL0	Target Time Low For PPS0 Stores the time in (signed) nanoseconds. If the value of the timestamp matches the value in both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt, if enabled, based on MAC_PPS_Control[TRGTMODSEL0]. • If MAC_Timestamp_Control[TSCTRLSSR] = 0, this value must be calculated as (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. • If MAC_Timestamp_Control[TSCTRLSSR] = 1, this value must not exceed 3B9A_C9FFh. The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. Access restriction apply to this field that clears automatically. Writing 0 to it has no effect.

78.17.170 MAC PPS0 Interval (MAC_PPS0_Interval)

Offset

Register	Offset
MAC_PPS0_Interval	B88h

Function

Contains the number of units of the sub-second increment value between the rising edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	PPSINT0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 PPSINT0	PPS Output Signal Interval 0 Stores the interval between the rising edges of the PPS0 signal output. The interval is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and the desired interval between the rising edges of the PPS0 signal output is 100 ns (that is, five units of the sub-second increment value), you must program value 4 (5-1) in this register.

78.17.171 MAC PPS0 Width (MAC_PPS0_Width)

Offset

Register	Offset
MAC_PPS0_Width	B8Ch

Function

Contains the number of units of the sub-second increment value between the rising and corresponding falling edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	PPSWIDTH0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 PPSWIDTH0	PPS Output Signal Width 0 Stores the width between the rising and corresponding falling edges of the PPS0 signal output. The width is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock has a frequency of 50 MHz (period of 20 ns), and a width between the rising and corresponding falling edges of the PPS0 signal output is 80 ns (that is, four units of the sub-second increment value), you should program value 3 (4-1) in this register. **NOTE** The value programmed in this register must be lesser than the value programmed in MAC PPS0 Interval (MAC_PPS0_Interval).

78.17.172 MAC PPS1 Target Time In Seconds (MAC_PPS1_Target_Time_Seconds)

Offset

Register	Offset
MAC_PPS1_Target_Time_Seconds	B90h

Function
Is used to schedule an interrupt event (MAC_Timestamp_Status[TSTARGT0]), along with the PPS Target Time Nanoseconds register, when the system time exceeds the value programmed in these registers.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-0	PPS Target Time In Seconds 1

Table continues on the next page...

Field	Function
TSTRH1	Stores the target time in seconds. When the timestamp value matches or exceeds both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt, if enabled, based on Target Time mode selected for the corresponding PPS output in MAC PPS Control (MAC_PPS_Control). If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and MAC_Timestamp_Control[PTGE] = 1, with the presentation time control set in Recovery mode, these fields indicate that the application programs the TPT. In Generation mode, it indicates that CPT is generated at the sampled trigger.

78.17.173 MAC PPS1 Target Time In Nanoseconds (MAC_PPS1_Target_Time_Nanoseconds)

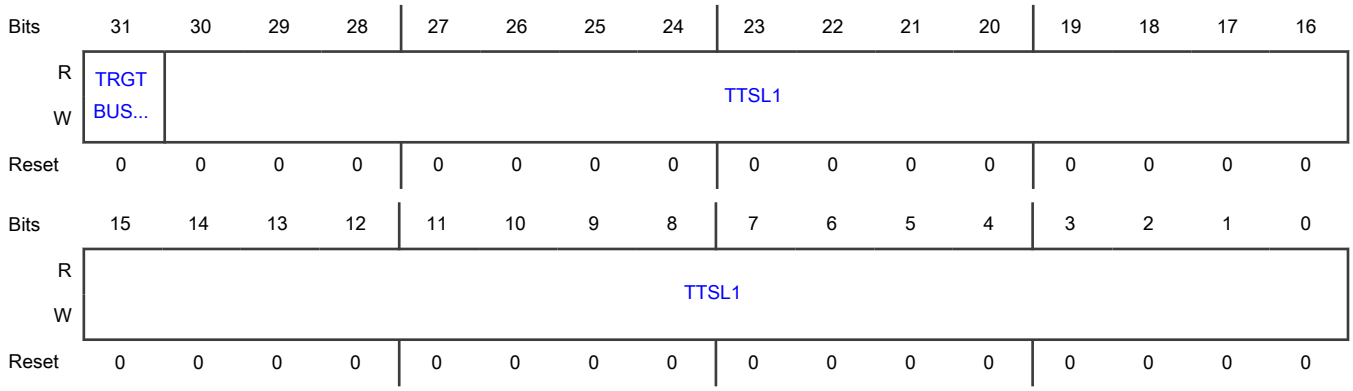
Offset

Register	Offset
MAC_PPS1_Target_Time_Nanoseconds	B94h

Function

Indicates the target time in nanoseconds for PPS1.

Diagram



Fields

Field	Function
31 TRGTBUSY1	PPS Target Time Busy Status 1 Indicates whether the PPS target time busy status 1 is detected. • MAC writes 1 to this field when MAC_PPS_Control[PPSCTRL_PPSCMD] is programmed to 010 or 011. Programming the PPSCMD0 field as 010 or 011 instructs MAC to synchronize the Target Time registers with the PTP clock domain.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• MAC writes 0 to this field after synchronizing the Target Time registers with the PTP clock domain. The application must not update the Target Time registers when this field is read as 1. Otherwise, the synchronization of the previously programmed time is corrupted. 0b - Not detected 1b - Detected
30-0 TTSL1	Target Time Low For PPS1 Stores the time in (signed) nanoseconds. If the value of the timestamp matches the value in both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt, if enabled, based on MAC_PPS_Control[TRGTMODSEL0]. • If MAC_Timestamp_Control[TSCTRLSSR] = 0, this value must be defined as (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. • If MAC_Timestamp_Control[TSCTRLSSR] = 1, this value must not exceed 3B9A_C9FFh. The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. Access restriction apply to this field that clears automatically. Writing 0 to it has no effect.

78.17.174 MAC PPS1 Interval (MAC_PPS1_Interval)

Offset

Register	Offset
MAC_PPS1_Interval	B98h

Function

Contains the number of units of the sub-second increment value between the rising edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	PPSINT1

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PPSINT1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 PPSINT1	PPS Output Signal Interval 1 Stores the interval between the rising edges of the PPS0 signal output. The interval is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and the desired interval between the rising edges of the PPS0 signal output is 100 ns (that is, five units of the sub-second increment value), you must program value 4 (5-1) in this register.

78.17.175 MAC PPS1 Width (MAC_PPS1_Width)

Offset

Register	Offset
MAC_PPS1_Width	B9Ch

Function
Contains the number of units of the sub-second increment value between the rising and corresponding falling edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	PPSWIDTH1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PPSWIDTH1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 PPSWIDTH1	PPS Output Signal Width 1 Stores the width between the rising and corresponding falling edges of the PPS0 signal output. The width is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock has a frequency of 50 MHz (period of 20 ns), and a width between the rising and corresponding falling edges of the PPS0 signal output is 80 ns (that is, four units of the sub-second increment value), you should program value 3 (4-1) in this register.

Table continues on the next page...

Field	Function
	NOTE The value programmed in this register must be lesser than the value programmed in MAC PPS0 Interval (MAC_PPS0_Interval).

78.17.176 MAC PPS2 Target Time In Seconds (MAC_PPS2_Target_Time_Seconds)

Offset

Register	Offset
MAC_PPS2_Target_Time_Seconds	BA0h

Function

Is used to schedule an interrupt event (MAC_Timestamp_Status[TSTARGT0]), along with the PPS Target Time Nanoseconds register, when the system time exceeds the value programmed in these registers.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	TSTRH2															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TSTRH2															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TSTRH2	PPS Target Time In Seconds 2 Stores the target time in seconds. When the timestamp value matches or exceeds both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt, if enabled, based on Target Time mode selected for the corresponding PPS output in MAC PPS Control (MAC_PPS_Control). If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and MAC_Timestamp_Control[PTGE] = 1, with the presentation time control set in Recovery mode, these fields indicate that the application programs the TPT. In Generation mode, it indicates that CPT is generated at the sampled trigger.

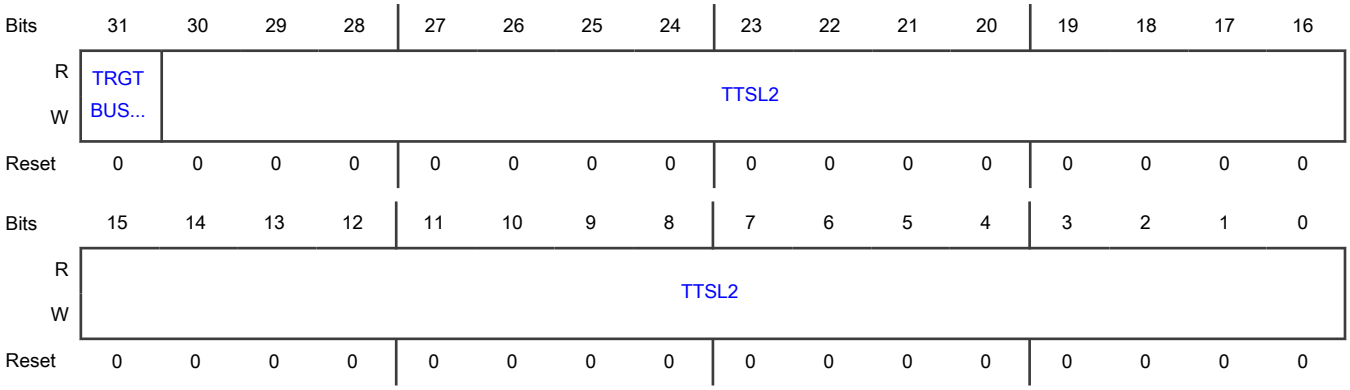
78.17.177 MAC PPS2 Target Time In Nanoseconds (MAC_PPS2_Target_Time_Nanoseconds)

Offset

Register	Offset
MAC_PPS2_Target_Time_Nanoseconds	BA4h

Function
Indicates the target time in nanoseconds for PPS2.

Diagram



Fields

Field	Function
31 TRGTBUSY2	PPS Target Time Busy Status 2 Indicates whether the PPS target time busy status 2 is detected. • MAC writes 1 to this field when MAC_PPS_Control[PPSCTRL_PPSCMD] is programmed to 010 or 011. This instructs MAC to synchronize the Target Time registers with the PTP clock domain. • MAC writes 0 to this field after synchronizing the Target Time registers with the PTP clock domain. The application must not update the Target Time registers when this field is read as 1. Otherwise, the synchronization of the previously programmed time is corrupted. 0b - Not detected 1b - Detected
30-0 TTSL2	Target Time Low For PPS2 Stores the time in (signed) nanoseconds. If the value of the timestamp matches the value in both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt, if enabled, based on MAC_PPS_Control[TRGTMODSEL0].

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• If MAC_Timestamp_Control[TSCTRLSSR] = 0, this value must be defined as (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. • If MAC_Timestamp_Control[TSCTRLSSR] = 1, this value must not exceed 3B9A_C9FFh. The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. Access restriction apply to this field that clears automatically. Writing 0 to it has no effect.

78.17.178 MAC PPS2 Interval (MAC_PPS2_Interval)

Offset

Register	Offset
MAC_PPS2_Interval	BA8h

Function

Contains the number of units of the sub-second increment value between the rising edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	PPSINT2															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PPSINT2															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 PPSINT2	PPS Output Signal Interval 2 Stores the interval between the rising edges of the PPS0 signal output. The interval is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and the desired interval between the rising edges of the PPS0 signal output is 100 ns (that is, five units of the sub-second increment value), you must program value 4 (5-1) in this register.

78.17.179 MAC PPS2 Width (MAC_PPS2_Width)

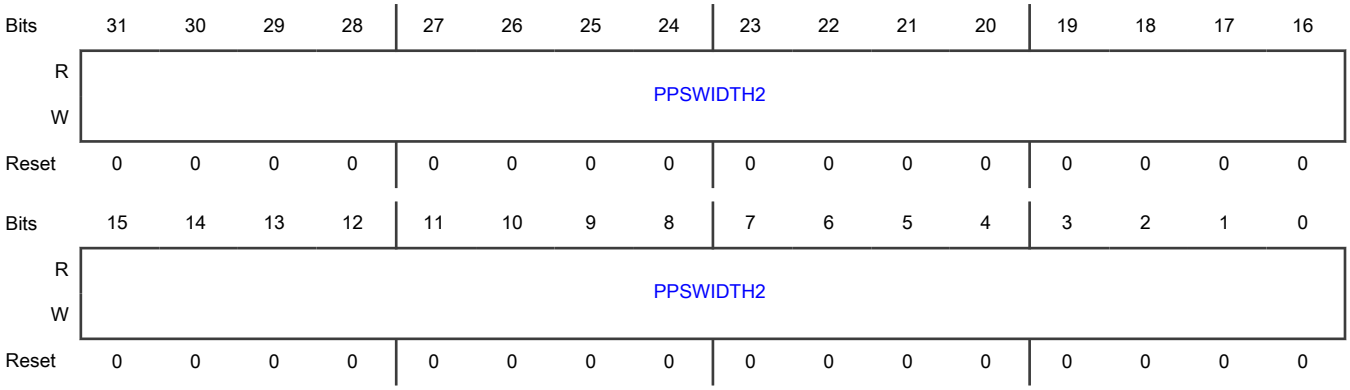
Offset

Register	Offset
MAC_PPS2_Width	BACh

Function

Contains the number of units of the sub-second increment value between the rising and corresponding falling edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram



Fields

Field	Function
31-0 PPSWIDTH2	PPS Output Signal Width 2 Stores the width between the rising and corresponding falling edges of the PPS0 signal output. The width is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock has a frequency of 50 MHz (period of 20 ns), and a width between the rising and corresponding falling edges of the PPS0 signal output is 80 ns (that is, four units of the sub-second increment value), you should program value 3 (4-1) in this register. **NOTE** The value programmed in this register must be lesser than the value programmed in MAC PPS0 Interval (MAC_PPS0_Interval).

78.17.180 MAC PPS3 Target Time In Seconds (MAC_PPS3_Target_Time_Seconds)

Offset

Register	Offset
MAC_PPS3_Target_Time_Seconds	BB0h

Function

Is used to schedule an interrupt event (MAC_Timestamp_Status[TSTARGT0]), along with the PPS Target Time Nanoseconds register, when the system time exceeds the value programmed in these registers.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	TSTRH3															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TSTRH3															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TSTRH3	PPS Target Time In Seconds 3 Stores the target time in seconds. When the timestamp value matches or exceeds both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt, if enabled, based on Target Time mode selected for the corresponding PPS output in MAC PPS Control (MAC_PPS_Control). If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and MAC_Timestamp_Control[PTGE] = 1, with the presentation time control set in Recovery mode, these fields indicate that the application programs the TPT. In Generation mode, it indicates that CPT is generated at the sampled trigger.

78.17.181 MAC PPS3 Target Time In Nanoseconds (MAC_PPS3_Target_Time_Nanoseconds)

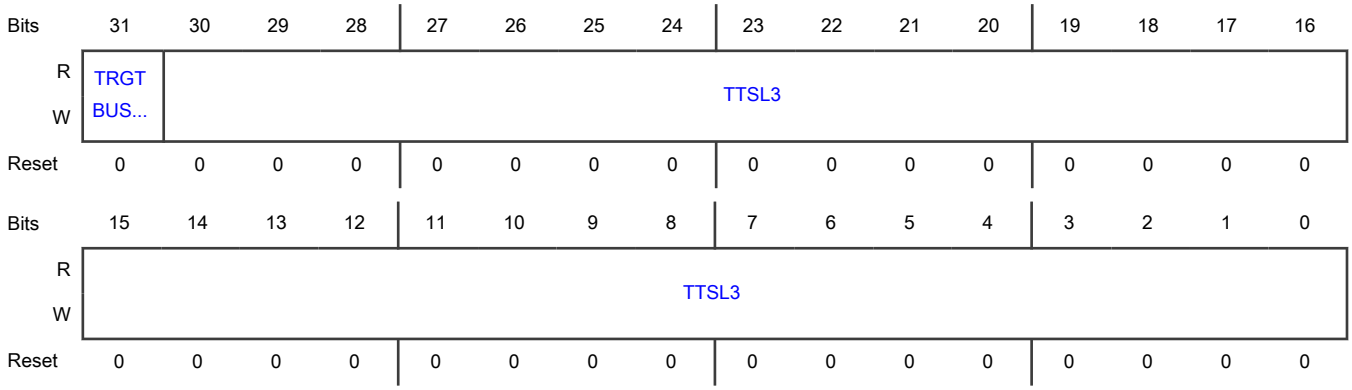
Offset

Register	Offset
MAC_PPS3_Target_Time_Nanoseconds	BB4h

Function

Indicates the target time in nanoseconds for PPS3.

Diagram



Fields

Field	Function
31 TRGTBUSY3	PPS Target Time Register Busy 3 Indicates whether the PPS target time register busy status is detected. MAC writes 1 to this field when MAC_PPS_Control[PPSCTRL_PPSCMD] is programmed to 010 or 011. This instructs MAC to synchronize the Target Time registers with the PTP clock domain. MAC writes 0 to this field after synchronizing the Target Time registers with the PTP clock domain. The application must not update the Target Time registers when this field is read as 1. Otherwise, the synchronization of the previously programmed time is corrupted. 0b - Not detected 1b - Detected
30-0 TTSL3	Target Time Low For PPS3 Stores the time in (signed) nanoseconds. If the value of the timestamp matches the value in both the Target Timestamp registers, MAC starts or stops the PPS signal output and generates an interrupt, if enabled, based on MAC_PPS_Control[TRGTMODSEL0]. • If MAC_Timestamp_Control[TSCTRLSSR] = 0, this value must be defined as (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. • If MAC_Timestamp_Control[TSCTRLSSR] = 1, this value must not exceed 3B9A_C9FFh. The actual start or stop time of the PPS signal output might have an error margin up to one unit of the sub-second increment value. Access restriction apply to this field that clears automatically. Writing 0 to it has no effect.

78.17.182 MAC PPS3 Interval (MAC_PPS3_Interval)

Offset

Register	Offset
MAC_PPS3_Interval	BB8h

Function

Contains the number of units of the sub-second increment value between the rising edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	PPSINT3															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PPSINT3															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 PPSINT3	PPS Output Signal Interval Stores the interval between the rising edges of the PPS0 signal output. The interval is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and the desired interval between the rising edges of the PPS0 signal output is 100 ns (that is, five units of the sub-second increment value), you must program value 4 (5-1) in this register.

78.17.183 MAC PPS3 Width (MAC_PPS3_Width)

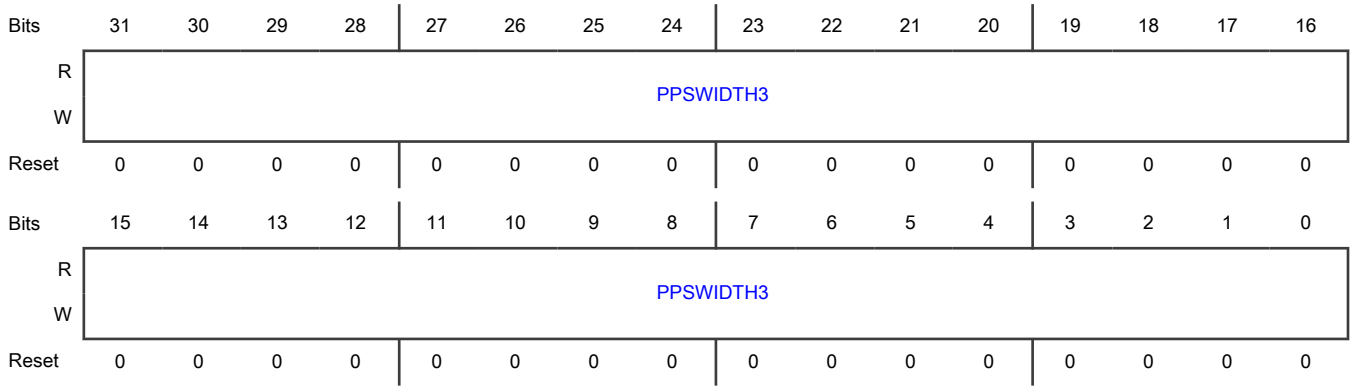
Offset

Register	Offset
MAC_PPS3_Width	BBCh

Function

Contains the number of units of the sub-second increment value between the rising and corresponding falling edges of the PPS0 signal output (ptp_pps_o[0]).

Diagram



Fields

Field	Function
31-0 PPSWIDTH3	PPS Output Signal Width 3 Stores the width between the rising and corresponding falling edges of the PPS0 signal output. The width is stored in terms of the number of units of the sub-second increment value. You must program one value less than the required interval. For example, if the PTP reference clock has a frequency of 50 MHz (period of 20 ns), and a width between the rising and corresponding falling edges of the PPS0 signal output is 80 ns (that is, four units of the sub-second increment value), you should program value 3 (4-1) in this register. **NOTE** The value programmed in this register must be lesser than the value programmed in MAC PPS0 Interval (MAC_PPS0_Interval).

78.17.184 MTL Operation Mode (MTL_Operation_Mode)

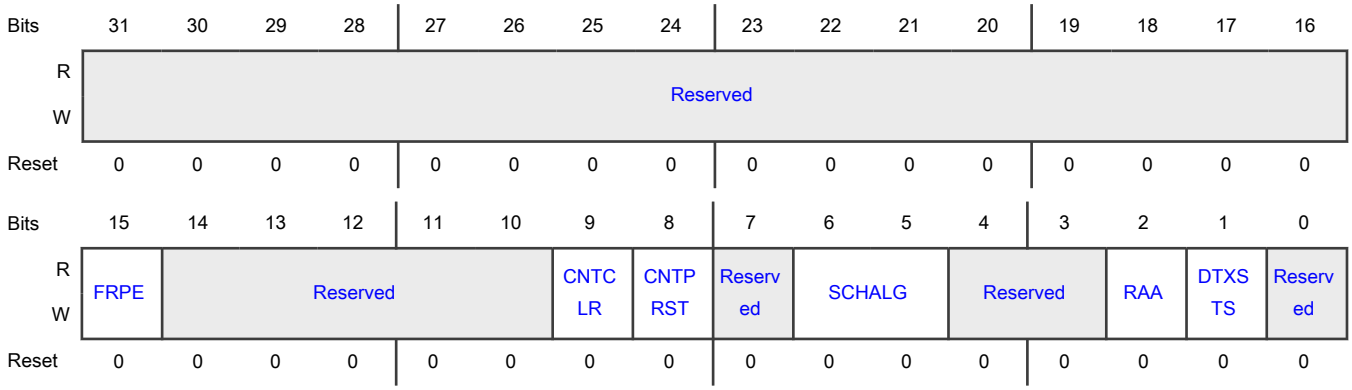
Offset

Register	Offset
MTL_Operation_Mode	C00h

Function

Establishes the transmit and receive operating modes and commands.

Diagram



Fields

Field	Function
31-16 —	Reserved
15 FRPE	Flexible Receive Parser Enable Indicates the status of the flexible receive parser. • If this field is 1, the programmable receive parser functionality is enabled. • If the receive parser is disabled and is in the middle of parsing, the receive parser functionality is disabled only after completing the current packet parsing. When the receive parser is enabled from the disabled state, the receive parser is activated for the next immediate packet. 0b - Disabled 1b - Enabled
14-10 —	Reserved
9 CNTCLR	Counters Reset Indicates whether the counters are reset. • If this field is 1, all the counters are reset. The field clears automatically after one clock cycle. • If you write 1 to this field along with the CNTPRST field, the CNT_PRESET field takes precedence. Access restrictions apply to this field that clears automatically. Writing 0 to it has no effect. 0b - Not reset 1b - Reset
8 CNTPRST	Counters Preset Indicates the status of preset counters. If this field is 1,

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• MTL Tx Queue 0 Underflow (MTL_TxQ0_Underflow)[bits 0-7] is initialized or preset to 12'h7F0. • Missed packet and overflow packet counters in MTL Rx Queue Missed Packet Overflow Count (MTL_RxQ0_Missed_Packet_Overflow_Cnt)[bits 0-7] are initialized or preset to 12'h7F0. Access restrictions apply to this field that clears automatically. Writing 0 to it has no effect. 0b - Disabled 1b - Enabled
7 —	Reserved
6-5 SCHALG	Transmit Scheduling Algorithm Indicates the algorithm for transmit scheduling. 00b - WRR algorithm 01b - WFQ algorithm when DCB feature selected; otherwise, reserved 10b - DWRR algorithm when DCB feature selected; otherwise, reserved 11b - Strict priority algorithm
4-3 —	Reserved
2 RAA	Receive Arbitration Algorithm Is used to select the arbitration algorithm for the receive side. Queue 0 has the lowest priority and the last queue has the highest priority. 0b - Strict priority (SP) 1b - Weighted strict priority (WSP)
1 DTXSTS	Drop Transmit Status Indicates whether the drop transmit status is enabled. • If this field is 1, the transmit packet status received from MAC is dropped in MTL. • If this field is 0, the transmit packet status received from MAC is forwarded to the application. 0b - Disabled 1b - Enabled
0 —	Reserved

78.17.185 MTL Debug Control (MTL_DBG_CTL)

Offset

Register	Offset
MTL_DBG_CTL	C08h

Function

Controls, along with MTL Debug Status (MTL_DBG_STS), the operation mode of FIFO debug access.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-19 —	Reserved
18-17 EIEC	ECC Inject Error Control Indicates the status of the ECC inject error control feature for transmit, receive, and TSO memories. If EIEE = 1, following are the errors inserted based on the value encoded in this field. 00b - 1-bit error 01b - 2-bit errors 10b - 3-bit errors 11b - 1-bit error in the address field
16 EIEE	ECC Inject Error Enable Indicates the status of the ECC error injection feature for transmit, receive, and TSO memories. • If the value if this field is 1, it enables the ECC error injection feature. • If the value if this field is 0, it disables the ECC error injection feature. 0b - Disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Enabled
15 STSIE	Transmit Status Available Interrupt Status Enable Indicates whether the transmit packet available interrupt status is enabled. If this field is 1, an interrupt is generated when transmit status is available in Slave mode. 0b - Disabled 1b - Enabled
14 PKTIE	Receive Packet Available Interrupt Status Enable Indicates whether the receive packet available interrupt status is enabled. If this field is 1, an interrupt is generated when EOP of the received packet is written to the receive FIFO. 0b - Disabled 1b - Enabled
13-12 FIFOSEL	FIFO Selected for Access Indicates the FIFO selected for debug access. 00b - Transmit FIFO 01b - Transmit status FIFO (only read access when SLVMOD is set) 10b - TSO FIFO (cannot be accessed when SLVMOD is set) 11b - Receive FIFO
11 FIFOWREN	FIFO Write Enable Indicates the status of FIFO write. If this field is 1, it enables the write operation on the selected FIFO when FIFO debug access is enabled. This field must not be written to 1 when FIFO debug access is disabled, that is, when FDBGEN = 0. Access restrictions apply to this field that clears automatically. Also, writing 0 to the field clears it and writing 1 sets it. 0b - Disabled 1b - Enabled
10 FIFORDEN	FIFO Read Enable Indicates the status of FIFO read. If this field is 1, it enables the read operation on the selected FIFO when FIFO debug access is enabled. This field must not be written to 1 when FIFO debug access is disabled, that is, when FDBGEN = 0. Access restrictions apply to this field that clears automatically. Also, writing 0 to the field clears it and writing 1 sets it. 0b - Disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Enabled
9 RSTSEL	Reset Pointers Of Selected FIFO Indicates whether the resetting of pointers for the selected FIFO is enabled. If this field is 1, the pointers of the currently selected FIFO are reset when FIFO debug access is enabled. This field must not be written to 1 when FIFO debug access is disabled, that is, when FDBGEN = 0. Access restrictions apply to this field that clears automatically. Also, writing 0 to the field clears it and writing 1 sets it. 0b - Disabled 1b - Enabled
8 RSTALL	Reset All Pointers Indicates whether the resetting of all the pointers is enabled. If this field is 1, the pointers of all the FIFOs are reset when the FIFO debug access is enabled. This field must not be written to 1 when FIFO debug access is disabled, that is, when FDBGEN = 0. Access restrictions apply to this field that clears automatically. Also, writing 0 to the field clears it and writing 1 sets it. 0b - Disabled 1b - Enabled
7 —	Reserved
6-5 PKTSTATE	Encoded Packet State Is used to write the control information to the transmit FIFO or receive FIFO. These are the values related to the transmit FIFO: • 00: Packet data • 01: Control word • 10: SOP data • 11: EOP data These are the values related to the receive FIFO: • 00: Packet data • 01: Normal status • 10: Last status • 11: EOP 00b - Packet data

Table continues on the next page...

Table continued from the previous page...

Field	Function
	01b - Control word/normal status 10b - SOP data/last status 11b - EOP data/EOP
4 —	Reserved
3-2 BYTEEN	Byte Enables Indicates the number of data bytes valid in the data register during a write operation. This is valid only when MTL_DBG_STS[PKTSTATE] is 2'b10 (EOP), and the transmit FIFO or receive FIFO is selected. 00b - Byte 0 valid 01b - Byte 0 and byte 1 valid 10b - Byte 0, byte 1, and byte 2 valid 11b - All four bytes valid
1 DBGMOD	Debug Mode Access to FIFO Indicates the status of Debug mode access to FIFO. If this field is 1, it indicates that the current access to FIFO is read, write, and debug. In this mode, the following access types are allowed: • Read and write access to transmit FIFO, TSO FIFO, and receive FIFO • Read access to transmit status FIFO If this field is 0, it indicates that the current access to FIFO is slave access bypassing DMA. In this mode, the following access types are allowed: • Write access to transmit FIFO • Read access to receive FIFO and transmit status FIFO 0b - Disabled 1b - Enabled
0 FDBGEN	FIFO Debug Access Enable Indicates the status of FIFO debug access. • If this field is 1, it indicates that the FIFO debug mode access is enabled. • If the value of the field is 0, it indicates that FIFO can be accessed only through a master interface. 0b - Disabled 1b - Enabled

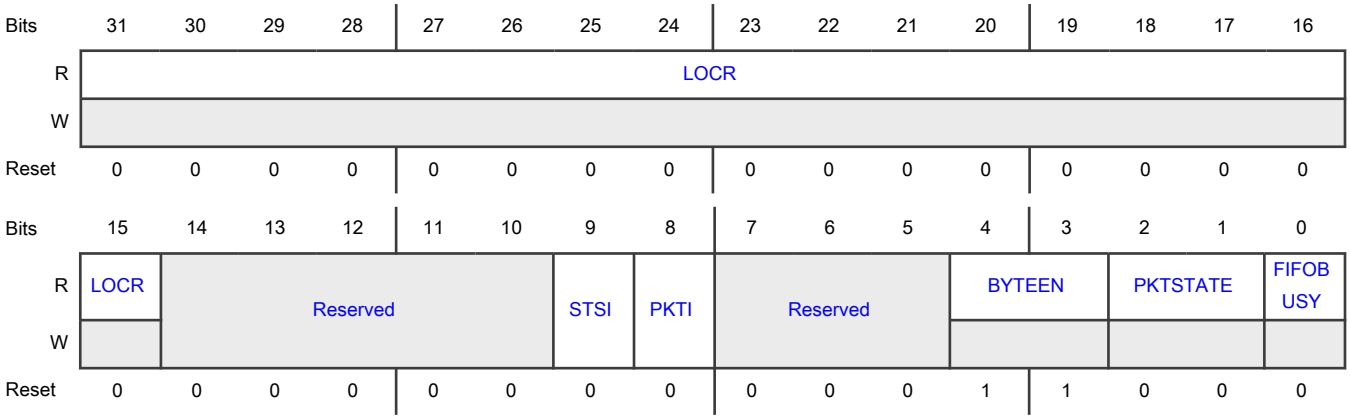
78.17.186 MTL Debug Status (MTL_DBG_STS)

Offset

Register	Offset
MTL_DBG_STS	C0Ch

Function
Contains the status of FIFO debug access.

Diagram



Fields

Field	Function
31-15 LOCR	Remaining Locations In FIFO Indicates the remaining locations in FIFO. For Slave Access mode, the field indicates the space available in the selected FIFO, and for Debug Access mode, this field contains the write or read pointer value of the selected FIFO during the write or read operation, respectively. Reset: In single transmit queue configurations, (DWC_EQOS_TXFIFO_SIZE/(DWC_EQOS_DATAWIDTH/8)), otherwise 0000h.
14-10 —	Reserved
9 STSI	Transmit Status Available Interrupt Status Indicates whether the transmit status available interrupt status is detected. If this field is 1, it indicates that Slave mode transmit packet is transmitted, and the status is available in transmit status FIFO. The field resets when you write 1 to it. 0b - Not detected 1b - Detected
8	Receive Packet Available Interrupt Status

Table continues on the next page...

Table continued from the previous page...

Field	Function
PKTI	Indicates whether the receive packet available interrupt status is detected. If this field is 1, it indicates that the MAC layer has written the EOP of the received packet to the receive FIFO. The field resets when you write 1 to it. 0b - Not detected 1b - Detected
7-5 —	Reserved
4-3 BYTEEN	Byte Enables Indicates the number of data bytes valid in the data register during a read operation. This is valid only when MTL_DBG_STS[PKTSTATE] is 2'b10 (EOP), and the transmit FIFO or receive FIFO is selected. 00b - Byte 0 valid 01b - Byte 0 and byte 1 valid 10b - Byte 0, byte 1, and byte 2 valid 11b - All four bytes valid
2-1 PKTSTATE	Encoded Packet State Is used to get the control or status information of the selected FIFO. These are the values related to the transmit FIFO. • 00: Packet data • 01: Control word • 10: SOP data • 11: EOP data These are the values related to the receive FIFO. • 00: Packet data • 01: Normal status • 10: Last status • 11: EOP This field is applicable only for transmit and receive FIFOs during a read operation. 00b - Packet data 01b - Control word/normal status 10b - SOP data/last status 11b - EOP data/EOP
0 FIFOBUSY	FIFO Busy Indicates whether the FIFO busy status is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	If this field is 1, it indicates that a FIFO operation is in progress in MAC and the content of the following is invalid: • All other fields of this register • All the fields of MTL FIFO Debug Data (MTL_FIFO_Debug_Data) 0b - Not detected 1b - Detected

78.17.187 MTL FIFO Debug Data (MTL_FIFO_Debug_Data)

Offset

Register	Offset
MTL_FIFO_Debug_Data	C10h

Function

Contains the data to be written to or read from the FIFOs.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	FDBGDATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 FDBGDATA	FIFO Debug Data Contains the data to be written to the transmit FIFO, receive FIFO, or TSO FIFO during a debug or slave access write operations. The field contains the data read from the transmit FIFO, receive FIFO, TSO FIFO, or transmit status FIFO during debug or slave access read operations.

78.17.188 MTL Interrupt Status (MTL_Interrupt_Status)

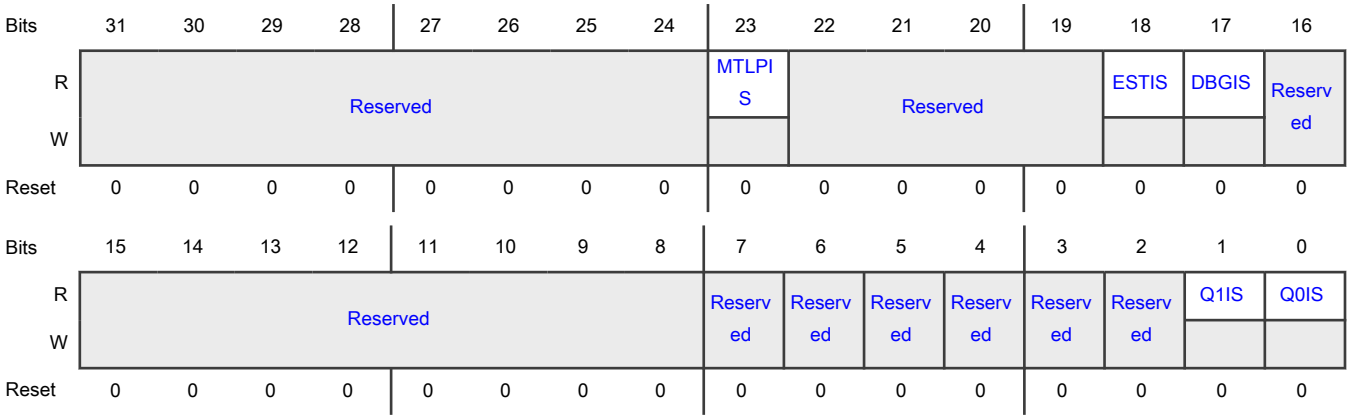
Offset

Register	Offset
MTL_Interrupt_Status	C20h

Function

Determines the interrupt status of MAC and MTL queues. The software driver (application) reads this register during an interrupt service routine or polling to perform this function.

Diagram



Fields

Field	Function
31-24 —	Reserved
23 MTLPIS	MTL Receive Parser Interrupt Status Indicates whether the MTL receive parser interrupt status is detected. This field indicates an interrupt from the receive parser block. To reset this field, the application must read MTL Rx Parser Interrupt Control Status (MTL_RXP_Interrupt_Control_Status) to get the exact cause of the interrupt and clear its source. 0b - Not detected 1b - Detected
22-19 —	Reserved
18 ESTIS	EST (TAS- 802.1Qbv) Interrupt Status Indicates whether the EST (TAS- 802.1Qbv) interrupt status is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field indicates an interrupt event during the operation of 802.1Qbv. To reset the field, the application must clear the error or event that caused the interrupt. 0b - Not detected 1b - Detected
17 DBGIS	Debug Interrupt Status Indicates whether the debug interrupt status is detected. This field indicates an interrupt event during the slave access. To reset the field, the application must read MTL Debug Status (MTL_DBG_STS) to get the exact cause of the interrupt and clear its source. 0b - Not detected 1b - Detected
16 —	Reserved
15-8 —	Reserved
7 —	Reserved
6 —	Reserved
5 —	Reserved
4 —	Reserved
3 —	Reserved
2 —	Reserved
1 Q1IS	Queue 1 Interrupt Status Indicates whether the queue 1 interrupt status is detected. To reset this field, the application must read MTL Queue 1 Interrupt Control Status (MTL_Q1_Interrupt_Control_Status) to get the exact cause of the interrupt and clear its source. 0b - Not detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Detected
0 Q0IS	Queue 0 Interrupt Status Indicates whether the queue 0 interrupt status is detected. To reset this field, the application must read MTL Queue 0 Interrupt Control Status (MTL_Q0_Interrupt_Control_Status) to get the exact cause of the interrupt and clear its source. 0b - Not detected 1b - Detected

78.17.189 MTL Receive Queue DMA Map 0 (MTL_RxQ_DMA_Map0)

Offset

Register	Offset
MTL_RxQ_DMA_Map0	C30h

Function
Reserves in EQOS-CORE and EQOS-MTL configurations.

Diagram

16 —	Reserved.
15-13 —	Reserved.
12 Q1DDMACH	Queue 1 Enabled for DA-based DMA Channel Selection Enables or disables queue 1 for DA-based DMA channel selection. If this field is 1, it indicates that the packets received in queue 1 are routed to a particular DMA channel as decided in the MAC receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When this field becomes 0, it indicates that the packets received in queue 1 are routed to the DMA Channel programmed in the MTL_RxQ_DMA_Map0[Q1MDMACH] (bits [10:8]). 0b - Disabled 1b - Enabled
11-9 —	Reserved.
8 Q1MDMACH	Queue 1 Mapped to DMA Channel Controls the routing of the received packet in Queue 1 to the DMA channel: 000b - DMA Channel 0 001b - DMA Channel 1 010b - DMA Channel 2 011b - DMA Channel 3

Table continues on the next page...

Table continued from the previous page...

Field	Function
	100b - DMA Channel 4 101b - DMA Channel 5 110b - DMA Channel 6 111b - DMA Channel 7 This field is valid when the MTL_RxQ_DMA_Map0[Q1DDMACH] resets. The field's width depends on the number of RX DMA channels and in some configurations all the values may not be valid . For example, if two RX DMA channels are selected, then only 000b and 001b are valid, the other bits are reserved.
7-5 —	Reserved.
4 Q0DDMACH	Queue 0 Enabled for DA-based DMA Channel Selection Enables or disables queue 0 for DA-based DMA channel selection. If this field is 1, it indicates that the packets received in queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When this field becomes 0, it indicate that the packets received in queue 0 are routed to the DMA Channel programmed in the MTL_RxQ_DMA_Map0[Q0MDMACH]. 0b - Disable 1b - Enable
3-1 —	Reserved.
0 Q0MDMACH	Queue 0 Mapped to DMA Channel Controls the routing of the packet received in queue 0 to the DMA channel: 000b - DMA channel 0 001b - DMA channel 1 010b - DMA channel 2 011b - DMA channel 3 100b - DMA channel 4 101b - DMA channel 5 110b - DMA channel 6 111b - DMA channel 7 This field is valid when the MTL_RxQ_DMA_Map0[Q0DDMACH] resets.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	The field's width depends on the number of RX DMA channels in some configurations all the values may not be valid. For example, if the number of RX DMA channels selected is 2, only 000 and 001 bits are valid, the other bits are reserved.

78.17.190 MTL TBS Control (MTL_TBS_CTRL)

Offset

Register	Offset
MTL_TBS_CTRL	C40h

Function
Controls the operation of time based scheduling.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	LEOS															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	LEOS								Reserved	LEGOS			Reserved		LEOV	ESTM
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-8 LEOS	Launch Expiry Offset Computes the launch expiry time. To compute the launch expiry time the value in units of 256 nanoseconds is added to the launch time. The field value is valid only if MTL_TBS_CTRL[LEOV] is 1. Max value: 999,999,999 nanosecond should be smaller than CTR-1 value when ESTM mode = 1, because this value is a modulo CTR value.
7 —	Reserved.
6-4	Launch Expiry GSN Offset

Table continues on the next page...

Table continued from the previous page...

Field	Function
LEGOS	Computes the Launch expiry time. To compute the launch expiry time the number of GSN slots is to be added to the launch GSN. The field value is valid only if MTL_TBS_CTRL[LEOV] is 1.
3-2 —	Reserved.
1 LEOV	Launch Expiry Offset Valid Indicates if MTL_TBS_CTRL[LEOS] is valid or invalid. When this field is 1, it indicates that MTL_TBS_CTRL[LEOS] is valid. When not 1, it indicates that the launch expiry Offset is not valid and the MTL must not check for launch expiry time. 0b - Invalid 1b - Valid
0 ESTM	EST offset Mode Enables or disables EST Offset mode. If this field is 1, the launch time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the BTR of the current list. When this field becomes 0, the launch time value is used as an absolute value that must be compared with the system time [39:8]. 0b - Disabled 1b - Enabled

78.17.191 MTL EST Control (MTL_EST_Control)

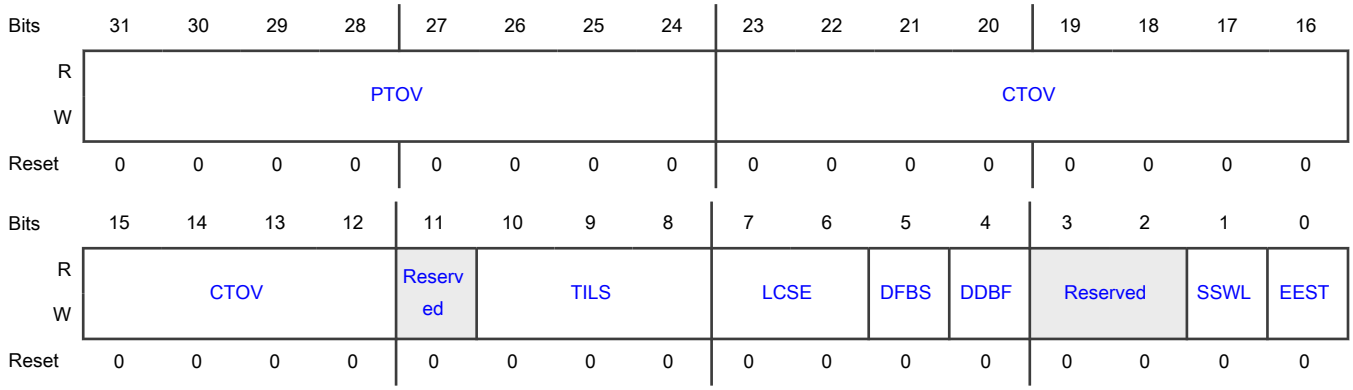
Offset

Register	Offset
MTL_EST_Control	C50h

Function

Controls the operation of enhancements to scheduled transmission (IEEE802.1Qbv).

Diagram



Fields

Field	Function
31-24 PTOV	PTP Time Offset Value Indicates the PTP time offset value. You must multiply 6 to the value of PTP clock period in nanoseconds. At the beginning of the installation of a new GCL this value avoid transmission overruns.
23-12 CTOV	Current Time Offset Value Provides a 12 bit time offset value in nano second which is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays and so on. This offset ensures that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).
11 —	Reserved.
10-8 TILS	Time Interval Left Shift Amount Provides the left shift amount for the programmed time interval values used in the gate control lists. 000b - No left shift needed (equal to x1ns) 001b - Left shift TI by 1 bit (equal to x2ns) 010b - Left shift TI by 2 bits (equal to x4ns) - - 100b - Left shift TI by 7 bits (equal to x128ns) On the basis of configuration you must consider one or more bits of this field as reserved or read-only.
7-6 LCSE	Loop Count to Report Scheduling Error Provides programmable number of GCL list iterations before reporting an HLBS error which is defined in MTL_EST_Status.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	00b - 4 iterations 01b - 8 iterations 10b - 16 iterations 11b - 32 iterations
5 DFBS	Drop Frames Causing Scheduling Error Provides the status of the frames causing scheduling error. If this field is 1 then the frames report to cause an HOL blocking because the MTL_EST_Status[HLBS] is not scheduled after 4,8,16,and 32 (on the basis of MTL_EST_Control[LCSE]) GCL iterations are dropped. 0b - Do not drop frames 1b - Drop frames
4 DDBF	Do not Drop Frames during Frame Size Error Provides status of frames during Frame Size Error. If this field is 1, it indicates that the frames are not dropped during head-of-line blocking because of the frame size error (MTL_EST_Status[HLBF]). 0b - Drop frames during frame size error 1b - Do not Drop frames during frame size error
3-2 —	Reserved.
1 SSWL	Switch to Software Owned List If this field is 1, it indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction apply to this field that clears on read and automatically becomes 1 on an internal event occurrence. Enables or disables the switch to the software owned list. 0b - Disabled 1b - Enabled
0 EEST	Enable EST Enables or disables EST. If the field becomes 0, it indicate that the gate control list processing is halted and all gates are assumed to be in open state. The field must be 1 for the hardware to start processing the gate control lists. During the toggle from 0 to 1, when the MTL_EST_Control[SSWL] is 1, the gate control list processing starts. During the configuration when DWC_EQOS_ASP_ECC is selected, the hardware resets this field and disables the EST function if any uncorrectable error is detected in the EST memory .

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled

78.17.192 MTL EST Status (MTL_EST_Status)

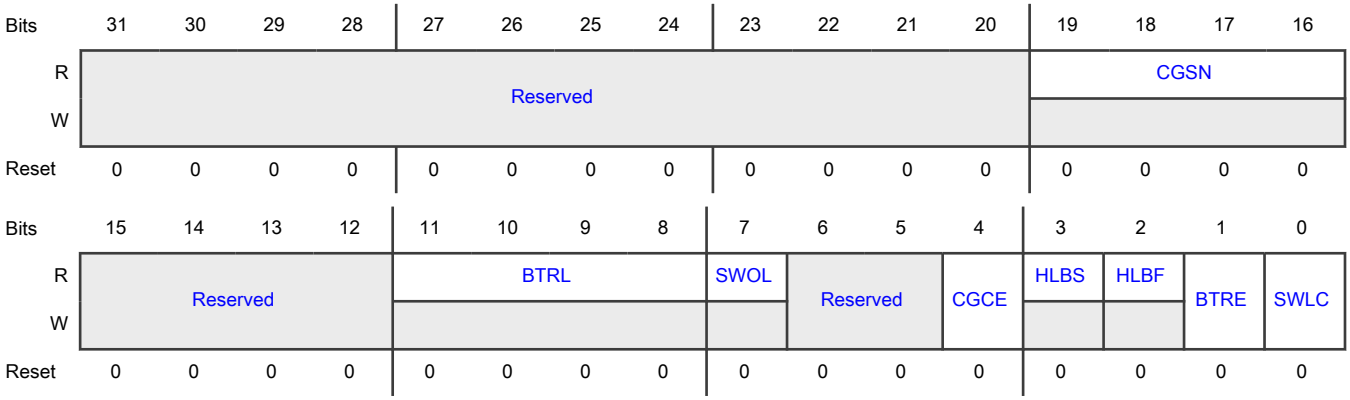
Offset

Register	Offset
MTL_EST_Status	C58h

Function

Provides status of enhancements to scheduled transmission (IEEE802.1Qbv).

Diagram



Fields

Field	Function
31-20 —	Reserved.
19-16 CGSN	Current GCL Slot Number Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15-12 —	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
11-8 BTRL	BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. N = "1111" indicates the iterations exceeded the value of 8 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7 SWOL	S/W owned list When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access via GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default. 0b - Gate control list number "0" is owned by software 1b - Gate control list number "1" is owned by software
6-5 —	Reserved.
4 CGCE	Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the Cycle Time (CTR) is less than or equal to the programmed Time Interval (TI) value after the optional Left Shifting. The above programming implies Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Constant Gate Control Error not detected 1b - Constant Gate Control Error detected
3 HLBS	Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_Sch_Error register. Bit cleared when MTL_EST_Sch_Error register is all zeros. 0b - Head-Of-Line Blocking due to Scheduling not detected 1b - Head-Of-Line Blocking due to Scheduling detected
2 HLBF	Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_Frm_Size_Error register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_Frm_Size_Capture register. Bit cleared when MTL_EST_Frame_Size_ Error register is all zeros.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Head-Of-Line Blocking due to Frame Size not detected 1b - Head-Of-Line Blocking due to Frame Size detected
1 BTRE	BTR Error Indicates whether the BTR error is detected. When this field is 1, it indicates a programming error in the BTR of SWOL where the programmed value is less than the current time. If the BTRL = "1111", SWOL is not updated and software must reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "1111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restrictions apply to this field. It sets automatically to 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - BTR Error not detected 1b - BTR Error detected
0 SWLC	Switch to Software Owned List Complete Indicates whether the switch to software owned list complete is detected. When the field is 1, it indicates that the hardware has successfully switched to the SWOL, and updated the MTL_EST_Status[SWOL] to that effect. This field is 0 when MTL_EST_Control[SSWL] transitions from 0 to 1, or on a software write. Access restrictions apply to this field. It clears automatically and writing 0 to it has no effect. 0b - Not detected 1b - Detected

78.17.193 MTL EST Scheduling Error (MTL_EST_Sch_Error)

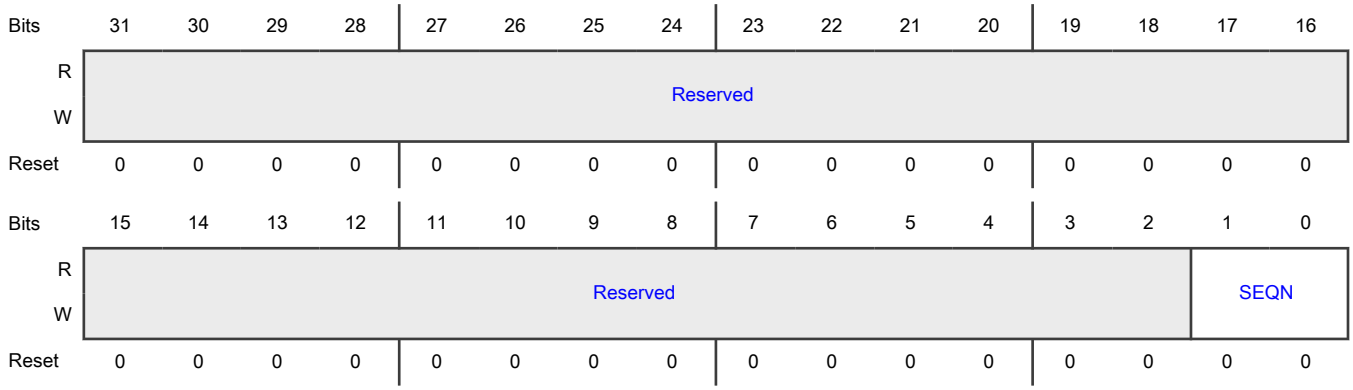
Offset

Register	Offset
MTL_EST_Sch_Error	C60h

Function

Provides the one hot encoded queue numbers that have the scheduling related error (timeout).

Diagram



Fields

Field	Function
31-2 —	Reserved.
1-0 SEQN	Schedule Error Queue Number Provides the one hot encoded queue numbers that have experienced error or timeout described in MTL_EST_Status[HLBS]. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 to it has no effect.

78.17.194 MTL EST Frame Size Error (MTL_EST_Frm_Size_Error)

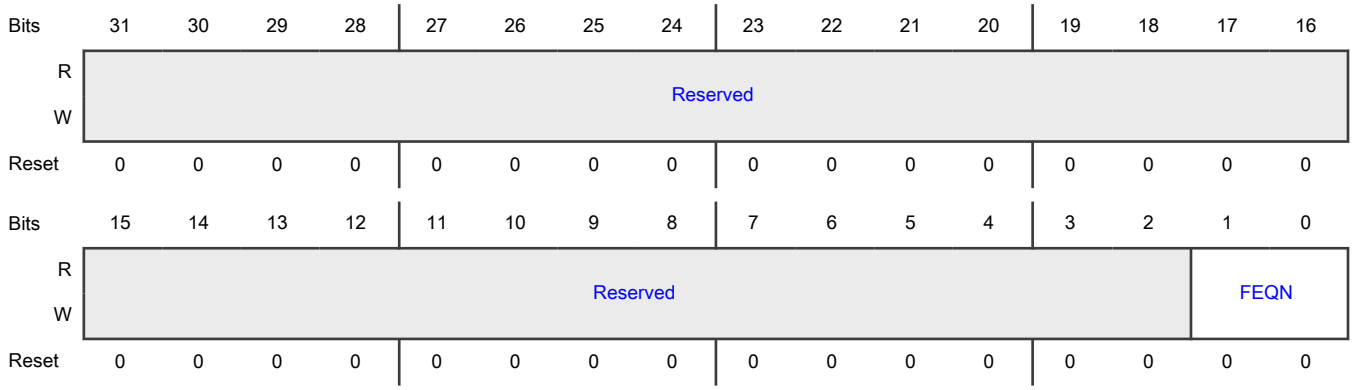
Offset

Register	Offset
MTL_EST_Frm_Size_Error	C64h

Function

Provides the one hot encoded queue numbers that have the frame Size related error.

Diagram



Fields

Field	Function
31-2 —	Reserved.
1-0 FEQN	Frame Size Error Queue Number Provides the one hot encoded queue Nnumbers that have experienced error described in MTL_EST_Status[HLBF]. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 to it has no effect.

78.17.195 MTL EST Frame Size Capture (MTL_EST_Frm_Size_Capture)

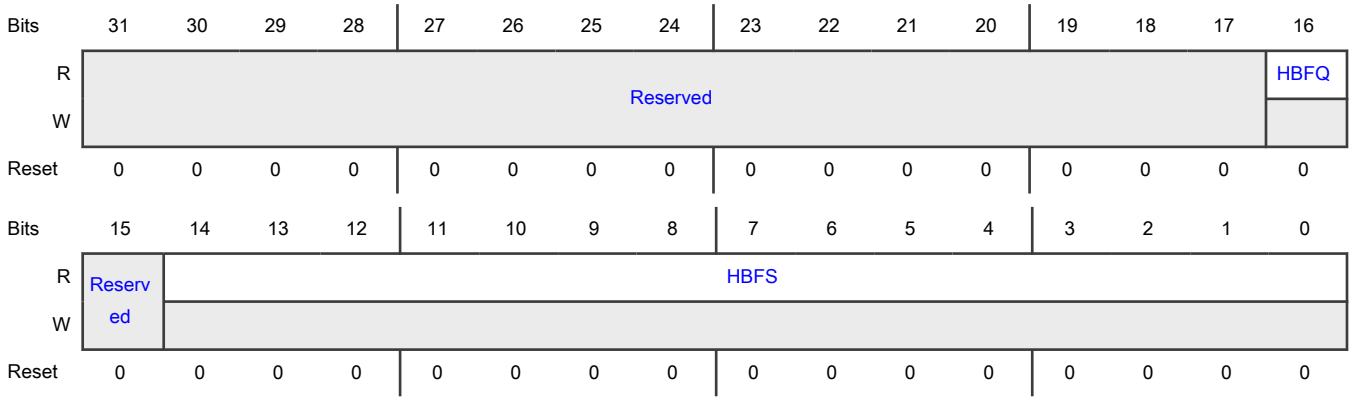
Offset

Register	Offset
MTL_EST_Frm_Size_Capture	C68h

Function

Captures the frame Size and queue number of the first occurrence of the frame Size related error. When you write 0, it captures the data of immediate next occurrence of a similar error.

Diagram



Fields

Field	Function
31-17 —	Reserved.
16 HBFQ	Queue Number of HLBF Captures the binary value of the first queue (number) which experiences the HLBF error (see MTL_EST_Status[HLBF]). Any subsequent queue errors similar to HLBF errors does not alter the value after it is written. After this field is 0, it captures the queue number of the next occurring HLBF error. Field's width is based on the number of transit queues configured; remaining fields are read-only. This field clears when MTL_EST_Frm_Size_Error is all zeros.
15 —	Reserved.
14-0 HBFS	Frame Size of HLBF Captures the frame Size of the dropped frame related to queue number indicated in MTL_EST_Frm_Size_Capture[HBFQ]. If this field is zero, then this register must be considered invalid. This field clears when MTL_EST_Frm_Size_Error is all zeros.

78.17.196 MTL EST Interrupt Enable (MTL_EST_Intr_Enable)

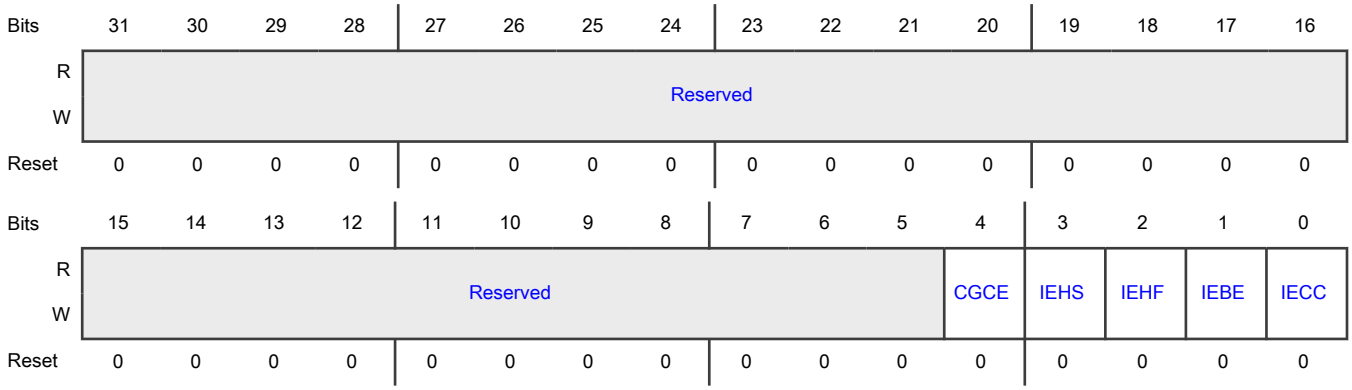
Offset

Register	Offset
MTL_EST_Intr_Enable	C70h

Function

Implements the interrupt enable fields for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL_ETS_Status register.

Diagram



Fields

Field	Function
31-5 —	Reserved.
4 CGCE	Interrupt Enable for CGCE Indicates whether an interrupt for MTL_EST_Intr_Enable[CGCE] is enabled. When this field is 1, it generates an interrupt when the constant gate control error occurs and is indicated in the status. When this field becomes 0, this event does not generate an interrupt 0b - Disabled 1b - Enabled
3 IEHS	Interrupt Enable for HLBS Indicates whether an interrupt for MTL_EST_Status[HLBS] is enabled. When this field is 1, it generates an interrupt when the head-of-line blocking due to scheduling issue occurs and is indicated in the status. When this field becomes 0, this event does not generate an interrupt. 0b - Disabled 1b - Enabled
2 IEHF	Interrupt Enable for HLBF Indicates whether an interrupt for MTL_EST_Status[HLBF] is enabled. When this field is 1, it generates an interrupt when the head-of-line blocking due to frame size error occurs and is indicated in the status. When this field becomes 0, this event does not generate an interrupt. 0b - Disabled 1b - Enabled
1 IEBE	Interrupt Enable for BTR Error Indicates whether an interrupt for BTR error is enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field is 1, it generates an interrupt when the BTR error occurs and is indicated in the status. When this field becomes 0, this event does not generate an interrupt. 0b - Disabled 1b - Enabled
0 IECC	Interrupt Enable for Switch List Indicates whether the interrupt for switch list is enabled. When this field is 1, it generates an interrupt when the configuration change is successful and the hardware switches to the new list. When this field becomes 0, this event does not generate an interrupt. 0b - Disabled 1b - Enabled

78.17.197 MTL EST GCL Control (MTL_EST_GCL_Control)

Offset

Register	Offset
MTL_EST_GCL_Control	C80h

Function

Provides the control information for reading and writing to the gate control lists.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-24	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
23-22 ESTEIEC	ECC Inject Error Control for EST Memory Provides the status of inject error control for EST memory. When MTL_EST_GCL_Control[ESTEIEE] = 1, it indicates that on the basis of the value encoded in this field following errors are inserted. This field is valid only if you select DWC_EQOS_ASP_ECC feature during the configuration, otherwise it is reserved. 00b - Insert 1 bit error 01b - Insert 2 bit errors 10b - Insert 3 bit errors 11b - Insert 1 bit error in address field
21 ESTEIEE	EST ECC Inject Error Enable Indicates whether the EST ECC inject error is enabled. If this field along with MTL_EST_Control[EEST] = 1, it enables the ECC error injection feature. When this field becomes 0, it disables the ECC error injection feature. 0b - Disabled 1b - Enabled
20 ERR0	If this field is 1, it indicates that when the software writes to GCL the last write operation was aborted and when MTL_EST_Control[SSWL] is 1, GCL registers are prohibited. Access restriction apply to this field and automatically becomes 1 on an internal event occurrence. Writing 1 to this field clears it and writing 0 to this field has no effect. 0b - ERR0 is disabled 1b - ERR1 is enabled
19-16 —	Reserved.
15-8 ADDR	Gate Control List Address: (GCLA when GCRR is "0"). Provides the address (row number) of the gate control list at which the R/W operation has to be performed. By default the gate control list to which MTL_EST_Status[SWOL] points is selected for read and write. If MTL_EST_GCL_Control[DBGM] is 1, it indicates that MTL_EST_GCL_Control[DBGB] gives Debug mode access to read and write. The field's width depends on DWC_EQOS_EST_DEP and the unused bits must be treated as read only. Gate Control list Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by MTL_EST_Status[SWOL] is selected for read or write. If MTL_EST_GCL_Control[DBGM], it indicates that MTL_EST_GCL_Control[DBGB] gives Debug mode access to read write. Lower 3 bits are only used in this mode, higher order bits are treated as don't cares.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	000b - BTR Low (31:0) 001b - BTR High (63:31) 010b - CTR Low (31:0) 011b - CTR High (39:32) 100b - TER (31:0) 101b - LLR (n:0) (where n is (log{DWC_EQOS_EST_DEP} / log2)) Others - Reserved
7-6 —	Reserved.
5 DBGB	Debug Mode Bank Select Indicates whether the read and write in Debug mode is directed to bank 0 or bank 1. When this field is 0, it indicates that read or write in Debug mode must be directed to bank 0 (GCL0 and corresponding Time related registers). When this field is 1, it indicates that read or write in Debug mode should be directed to bank 1 (GCL1 and corresponding Time related registers). When MTL_EST_GCL_Control[DBGM] is 1 you can use this value and overrides with the MTL_EST_Status[SWOL] value. 0b - Directed to bank 0 1b - Directed to bank 1
4 DBGM	Debug Mode Enables or disables Debug mode. When this field is 1, it indicates that the read and write is in Debug mode where the MTL_EST_GCL_Control[DBGB] value explicitly provides the memory bank (for GCL and time related registers). When this field is 0, it indicates that MTL_EST_Status[SWOL] determines which bank to use. 0b - Disabled 1b - Enabled
3 —	Reserved.
2 GCRR	Gate Control Related Registers Enables or disables gate control related registers. When this field is 1, it indicates that the read or write access is for the GCL related registers (BTR, CTR, TER, LLR) for which GCRA provides the address. When this field is 0, it indicates that read and write must be directed to GCL from the address which GCLA provides. 0b - Disabled 1b - Enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
1 R1W0	Read '1', Write '0' Indicates whether this field performs read operation or write operation. When this field is 1 it indicates that it performs a read operation. When this field is 0 it indicates that it performs a write operation. 0b - Write operation 1b - Read operation
0 SRWO	Start Read/Write Operation Indicates whether the read/write operation is enabled. When this field is 1, it indicates that a read/write operation has started and is in progress. When hardware resets this field and MTL_EST_GCL_Control[ERR0] = 1 , it indicates that the read/write operation has completed or an error has occurred. Reads: When this field becomes 0, it indicates that MTL_EST_GCL_Data reads data. Writes: Before writing 1 to this field, you must program MTL_EST_GCL_Data with write data. Access restrictions apply to this field. It clears automatically. Writing 1 sets this field and writing 0 to it has no effect. 0b - Disabled 1b - Enabled

78.17.198 MTL EST GCL Data (MTL_EST_GCL_Data)

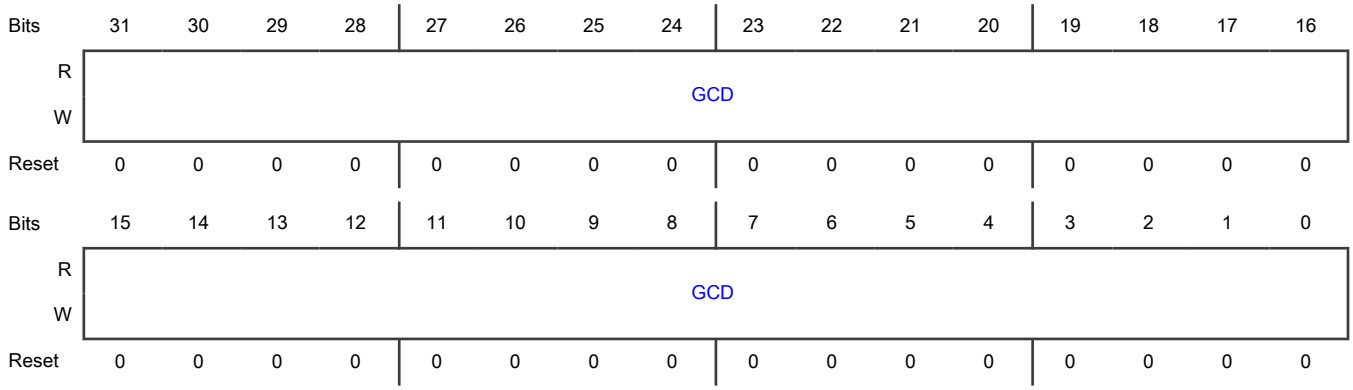
Offset

Register	Offset
MTL_EST_GCL_Data	C84h

Function

Holds the read data or write data in case of reads and writes respectively.

Diagram



Fields

Field	Function
31-0 GCD	Gate Control Data Provides the data corresponding to the address selected in the MTL_EST_GCL_Control. This field is used for both read and write operations.

78.17.199 MTL FPE Control Status (MTL_FPE_CTRL_STS)

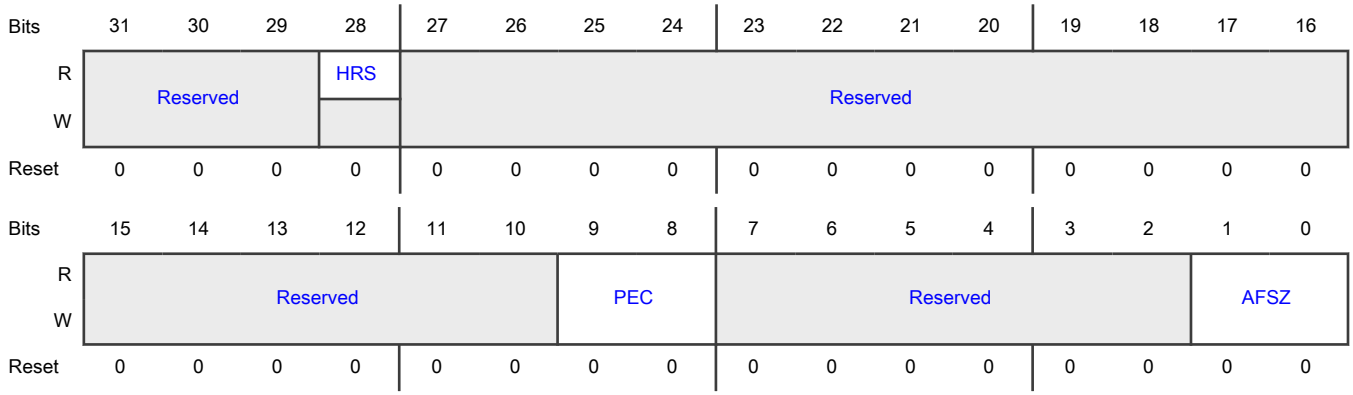
Offset

Register	Offset
MTL_FPE_CTRL_STS	C90h

Function

Controls the operation of, and provides status for frame preemption (IEEE802.1Qbu/802.3br).

Diagram



Fields

Field	Function
31-29 —	Reserved.
28 HRS	Hold/Release Status Indicates whether a set-and-release-MAC operation which was last executed and the pMAC is in release state or in hold state. 0b - Release state 1b - Hold state
27-16 —	Reserved.
15-10 —	Reserved.
9-8 PEC	Preemption Classification When this field is 1, it indicates that you must classify the corresponding queue as preemptable. When this field is 0, it indicates that you must classify the queue as express. When set indicates the corresponding Queue must be classified as preemptable, when '0' Queue is classified as express. When both EST (Qbv) and Preemption are enabled, Queue-0 is always assumed to be preemptable. When you enables EST (Qbv), the preemptable queues are always assumed to be in open state in gate control list.
7-2 —	Reserved.
1-0 AFSZ	Additional Fragment Size Indicates that, in units of 64 bytes, the minimum number of bytes over 64 bytes required in non-final fragments of preempted frames. The minimum non-final fragment size is (AFSZ +1) * 64 bytes.

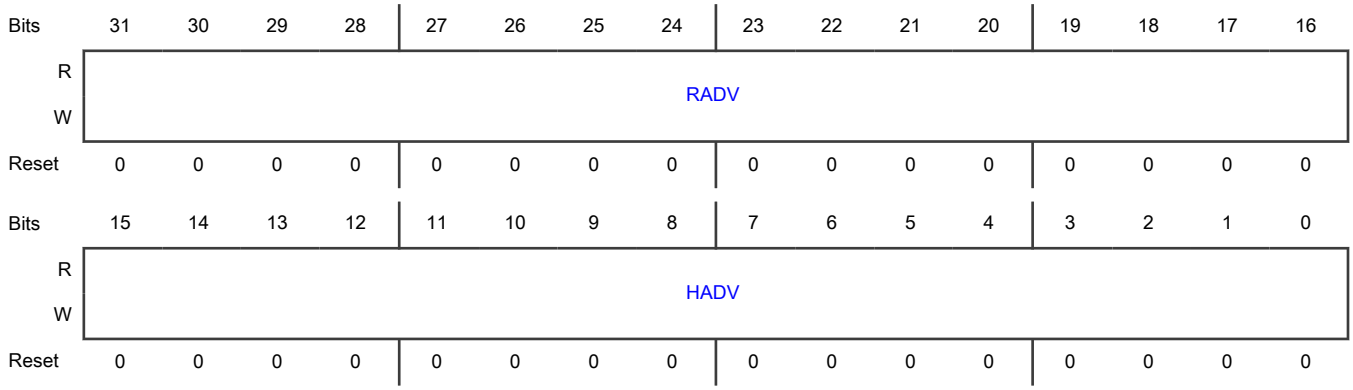
78.17.200 MTL FPE Advance (MTL_FPE_Advance)

Offset

Register	Offset
MTL_FPE_Advance	C94h

Function
Holds the hold and release advance time.

Diagram



Fields

Field	Function
31-16 RADV	Release Advance Provides the maximum time in nanoseconds that can elapse between issuing a release to the MAC and the MAC being ready to resume transmission of preemptable frames, in the absence of there being any express frames available for transmission.
15-0 HADV	Hold Advance Provides the maximum time in nanoseconds that can elapse between issuing a hold to the MAC and the MAC ceasing to transmit any preemptable frame that is in the process of transmission or any preemptable frames that are queued for transmission.

78.17.201 MTL Rx Parser Control Status (MTL_RXP_Control_Status)

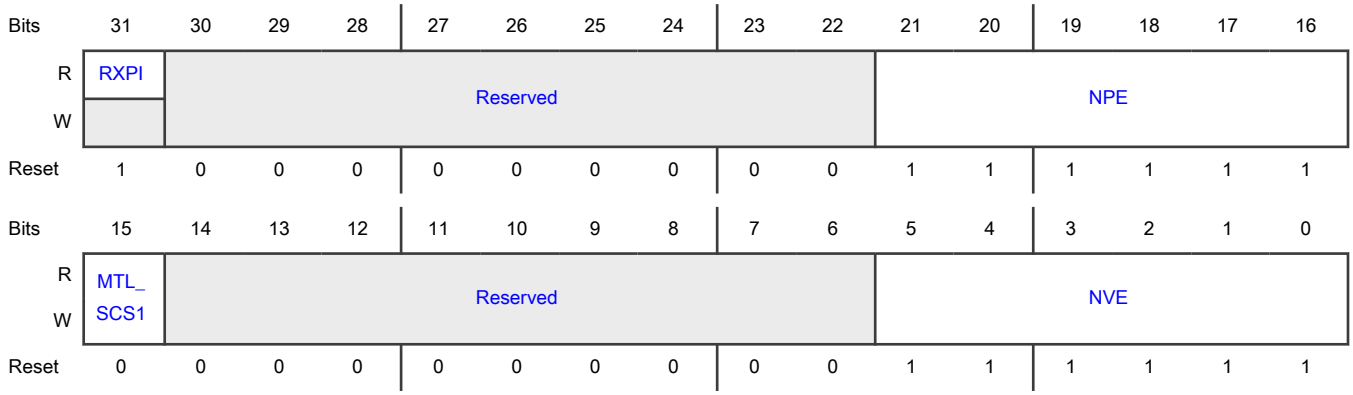
Offset

Register	Offset
MTL_RXP_Control_Status	CA0h

Function

Establishes the operating mode of receive parser and provides some status.

Diagram



Fields

Field	Function
31 RXPI	RX Parser in Idle State Indicates whether the receive parser is in idle state. When this field is 1, it indicates that the receive parser is in idle state and waiting for the processing of a new packet. When parser disables, you can use this field as a handshake with software and also the software can update the receive parser instruction table when you write 1 to this field. 0b - Not in Idle state 1b - Idle state
30-22 —	Reserved.
21-16 NPE	Number of parsable entries in the Instruction table Indicates the number of parsable entries in the instruction memory. This is used in receive parser logic to detect programming error. MTL_RXP_Interrupt_Control_Status[NPEOVIS] = 1, if the number of parsed entries for a packet is more than this entry.
15 MTL_SCS1	MTL_SCS1 Is reserved for NXP internal use. The value of this field must always be 0 unless NXP instructs you otherwise. Writing 1 to any of the bits of this field might cause unexpected behavior in th IP.
14-6 —	Reserved.
5-0 NVE	Number Of Valid Entry Address Or Index In The Instruction Table Indicates the number of valid entry address or index in the instruction memory.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	The maximum valid entry address is = NVE + 1 and the addresses or indices range from 0 to 32. Therefore, if the value of this field is 32, the number of valid entry address is 33. This value is used in receive parser logic to detect if any programming errors exist. When parsing, the module writes 1 to NVEOVIS if the number of the memory address is found to be more than the defined maximum valid entry address number. **NOTE** The minimum value of this field must be two.

78.17.202 MTL Rx Parser Interrupt Control Status (MTL_RXP_Interrupt_Control_Status)

Offset

Register	Offset
MTL_RXP_Interrupt_Control_Status	CA4h

Function
Provides enable control for the interrupts and also provides interrupt status.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved												PDRFIE	FOOVIE	NPEOVIE	NVEOVIE
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved												PDRFIS	FOOVIS	NPEOVIS	NVEOVIS
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-20 —	Reserved.
19 PDRFIE	Packet Drop due to RF Interrupt Enable Indicates whether the packet drop due to RF interrupt is enabled. If this field is 1, it enables the PDRFIS interrupt. When this field becomes 0, it disables the PDRFIS interrupt.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
18 FOOVIE	Frame Offset Overflow Interrupt Enable Indicates whether the frame offset overflow interrupt is enabled. If this field is 1, it enables the FOOVIS interrupt. When this field becomes 0, it disables the FOOVIS interrupt. 0b - Disabled 1b - Enabled
17 NPEOVIE	Number of Parsable Entries Overflow Interrupt Enable Enables or disables the number of parsable entries overflow interrupt. If this field is 1, it enables the NPEOVIS interrupt. When this field becomes 0, it disables the NPEOVIS interrupt. 0b - Disable 1b - Enable
16 NVEOVIE	Number of Valid Entries Overflow Interrupt Enable Enables or disables the number of valid entries overflow interrupt. If this field is 1, it enables the NVEOVIS interrupt. When this field becomes 0, it disables the NVEOVIS interrupt. 0b - Disable 1b - Enable
15-4 —	Reserved.
3 PDRFIS	Packet Dropped due to RF Interrupt Status Indicates whether the packet dropped due to RF interrupt status is detected. If the Rx Parser result says to drop the packet by setting RF=1 in the instruction memory, then this bit is set to 1. This field clears when the application writes 1 to this field. Access apply to this field. It automatically sets to 1 on an internal event occurrence. Writing 1 clears this field and writing 0 to it has no effect. 0b - Not detected 1b - Detected
2	Frame Offset Overflow Interrupt Status

Table continues on the next page...

Table continued from the previous page...

Field	Function
FOOVIS	Indicates whether the frame offset overflow interrupt status is detected. If this field is 1, it indicates that when parsing, the instruction table entry's frame offset is more than the EOF offset. This field clears when the application writes 1 to this field. Access apply to this field. It automatically sets to 1 on an internal event occurrence. Writing 1 clears this field and writing 0 to it has no effect. 0b - Not detected 1b - Detected
1 NPEOVIS	Number of Parsable Entries Overflow Interrupt Status Indicates whether the number of parsable entries overflow interrupt status is detected. If this field is 1, it indicates that when parsing a packet the number of parsed entries are more than NPE[] (MTL_RXP_Control_Status[NPE]). This field clears when the application writes 1 to this field. Access apply to this field. It automatically sets to 1 on an internal event occurrence. Writing 1 clears this field and writing 0 to it has no effect. 0b - Not detected 1b - Detected
0 NVEOVIS	Number of Valid Entry Address/Index Overflow Interrupt Status Indicates whether the number of valid entry address or index overflow interrupt status is detected. If this field is 1, it indicates that when parsing, the instruction address is more than MTL_RXP_Control_Status[NVE]. For example, when MTL_RXP_Control_Status[NVE] = 31, the maximum valid entry address/index is NVE+1 that is 32 (addresses/indices = 0 to 32, or 33 entries). MTL_RXP_Interrupt_Control_Status[NVEOVIS] = 1 when currently processed entry indicates that the next address is 33 or more, that is 34th or later entries. This field clears when the application writes 1 to this field. Access apply to this field. It automatically sets to 1 on an internal event occurrence. Writing 1 clears this field and writing 0 to it has no effect. 0b - Not detected 1b - Detected

78.17.203 MTL Rx Parser Drop Count (MTL_RXP_Drop_Cnt)

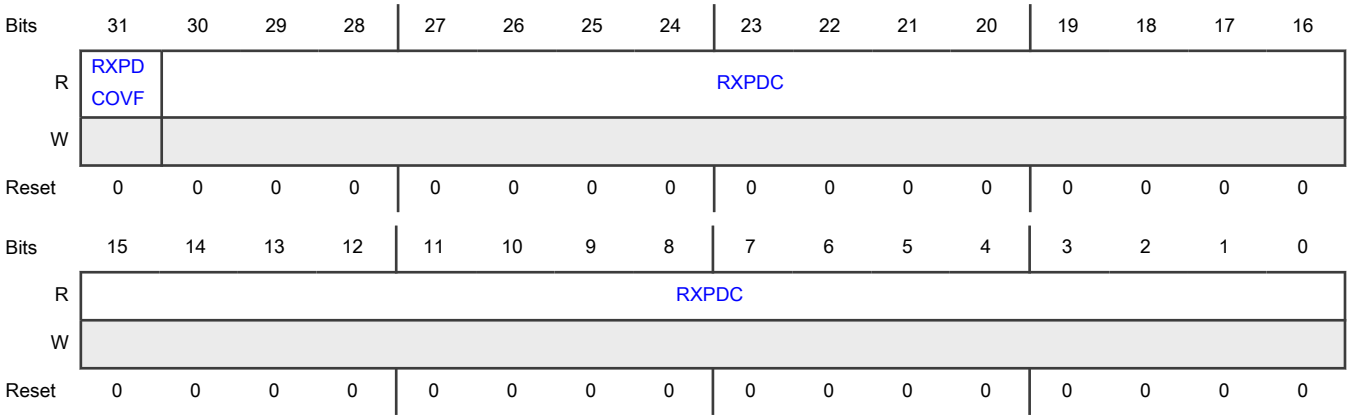
Offset

Register	Offset
MTL_RXP_Drop_Cnt	CA8h

Function

Provides the drop count of receive parser initiated drops.

Diagram



Fields

Field	Function
31 RXPDCOVF	Rx Parser Drop Counter Overflow Bit Indicates whether the receive parser drop count overflow has occurred. When this field is 1, it indicates that the MTL_RXP_Drop_Cnt[RXPDC] counter field has crossed the maximum limit. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not occurred 1b - Occurred
30-0 RXPDC	Rx Parser Drop Count Provides the receive parser drop count. This 31-bit counter is implemented whenever a receive parser drops a packet due to RF = 1. The counter clears when you read the register.

78.17.204 MTL Rx Parser Error Count (MTL_RXP_Error_Cnt)

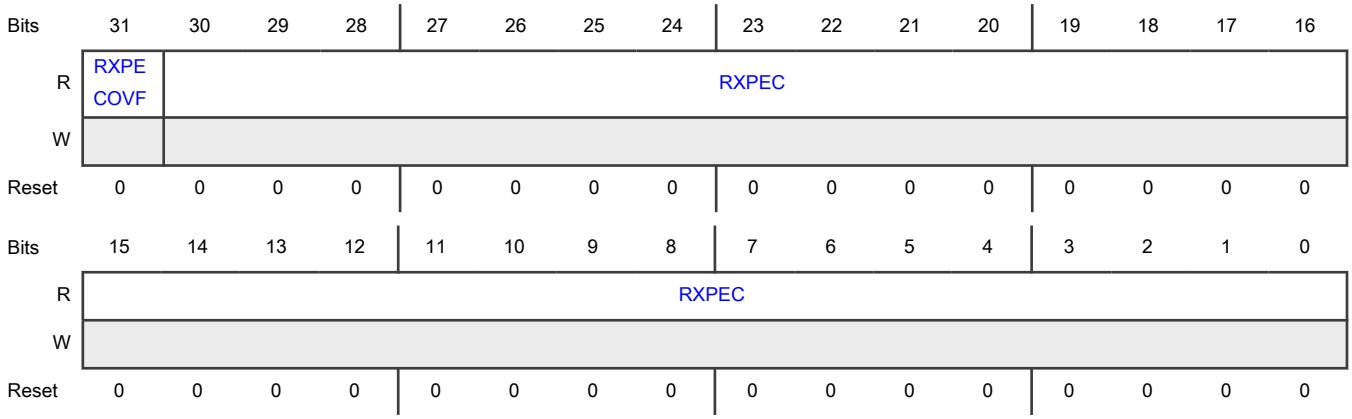
Offset

Register	Offset
MTL_RXP_Error_Cnt	CACh

Function

Provides the receive parser related error occurrence count.

Diagram



Fields

Field	Function
31 RXPECOVF	Rx Parser Error Counter Overflow Bit Indicates whether the receive parser error counter overflow has occurred. When this field is 1, it indicates that MTL_RXP_Error_Cnt[RXPEC] counter field has crossed the maximum limit. Access restrictions apply to this field, which clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not occurred 1b - Occurred
30-0 RXPEC	Rx Parser Error Count Provides the receive parser error count. This 31-bit counter is implemented whenever a receive parser encounters following error scenarios: Entry address >= NVE[] Number parsed entries >= NPE[] Entry address > EOF data entry address The counter clears when you read the register.

78.17.205 MTL Rx Parser Indirect Access Control Status (MTL_RXP_Indirect_Acc_Control_Status)

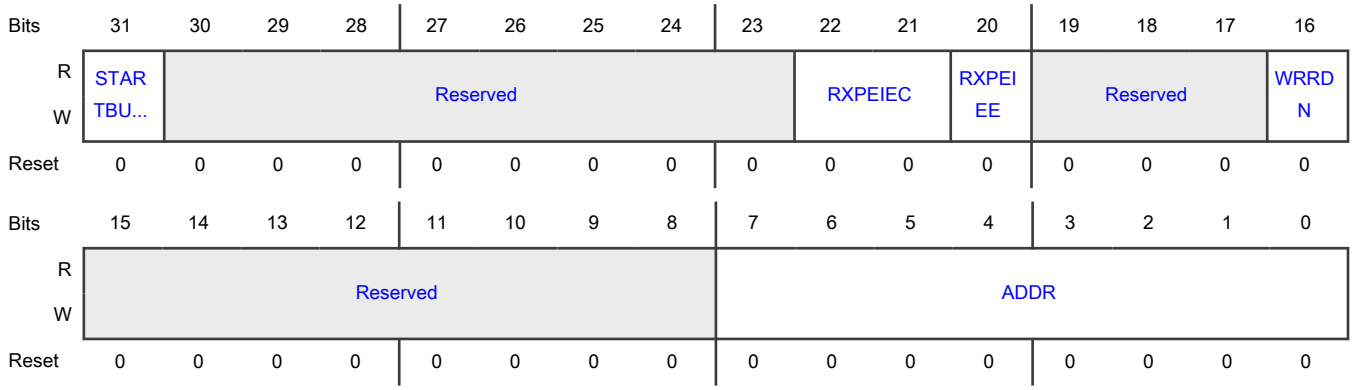
Offset

Register	Offset
MTL_RXP_Indirect_Acc_Control_Status	CB0h

Function

Provides the indirect access control and status for receive parser memory.

Diagram



Fields

Field	Function
31 STARTBUSY	FRP Instruction Table Access Busy When this bit is set to 1 by the software then it indicates to start the Read/Write operation from/to the Rx Parser Memory. Software should read this bit as 0 before issuing read or write request to access the Parser Memory Instructions. This bit when set to 1 indicates that hardware is busy until its gets cleared by hardware and software should not issue any read or write operation. 0b - hardware not busy 1b - hardware is busy (Read/Write operation from/to the Rx Parser Memory)
30-23 —	Reserved.
22-21 RXPEIEC	ECC Inject Error Control for Rx Parser Memory Controls the ECC inject error for receive parser memory. When MTL_RXP_Indirect_Acc_Control_Status[RXPEIEE] = 1, it indicates that on the basis of the value encoded in this field following errors are inserted: 00b - Insert 1 bit error 01b - Insert 2 bit errors 10b - Insert 3 bit errors 11b - Insert 1 bit error in address field
20 RXPEIEE	ECC Inject Error Enable for Rx Parser Memory Indicates whether the ECC inject error for receive parser memory is enabled. If this field is 1, it enables the ECC error injection feature. When this field becomes 0, it disables the ECC error injection feature.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disabled 1b - Enabled
19-17 —	Reserved.
16 WRRDN	Read Write Control Controls the read and write operation to the receive parser memory. If this field is 1, it indicates the write operation to the receive parser memory. When this field is 0, it indicates the read operation to the receive parser memory. 0b - Read operation to the receive parser memory 1b - Write operation to the receive parser memory
15-8 —	Reserved.
7-0 ADDR	FRP Instruction Table Offset Address Indicates the ADDR of the 32-bit entry in receive parser instruction table. Each entry has 128-bit (4x32-bit words). The X depends on the configurable DWC_EQOS_FRP_ENTRIES. If DWC_EQOS_FRP_ENTRIES = 256 , then X = 9 If DWC_EQOS_FRP_ENTRIES = 128 , then X = 8 If DWC_EQOS_FRP_ENTRIES = 64, then X = 7

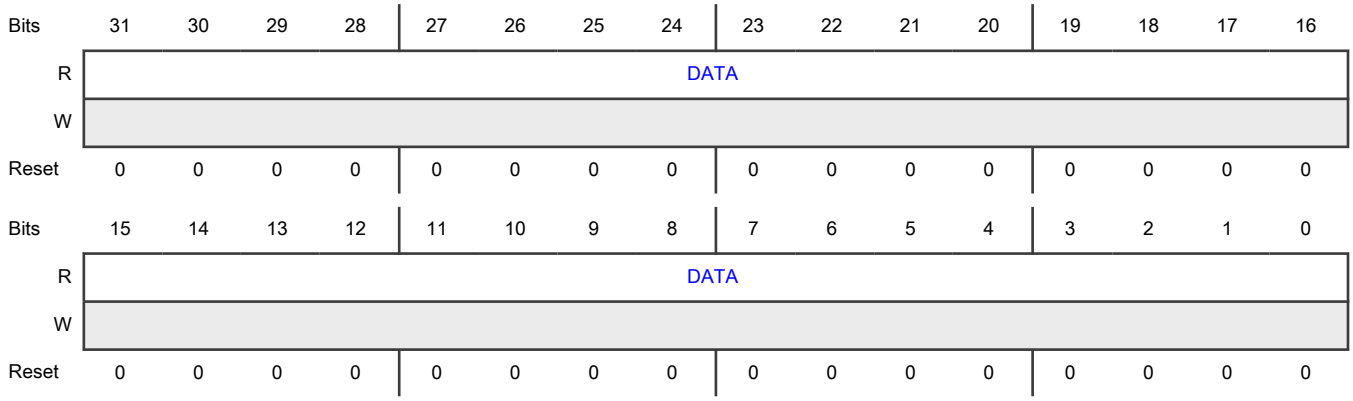
78.17.206 MTL Rx Parser Indirect Access Data (MTL_RXP_Indirect_Acc_Data)

Offset

Register	Offset
MTL_RXP_Indirect_Acc_Data	CB4h

Function
Provides the data associated to indirect access to receive parser memory.

Diagram



Fields

Field	Function
31-0 DATA	FRP Instruction Table Write/Read Data You must write this register before issuing any write command. After read command, when MTL_RXP_Indirect_Acc_Control_Status[STARTBUSY] = 0, the hardware provides the read data from the receive parser memory for read operation.

78.17.207 MTL ECC Control (MTL_ECC_Control)

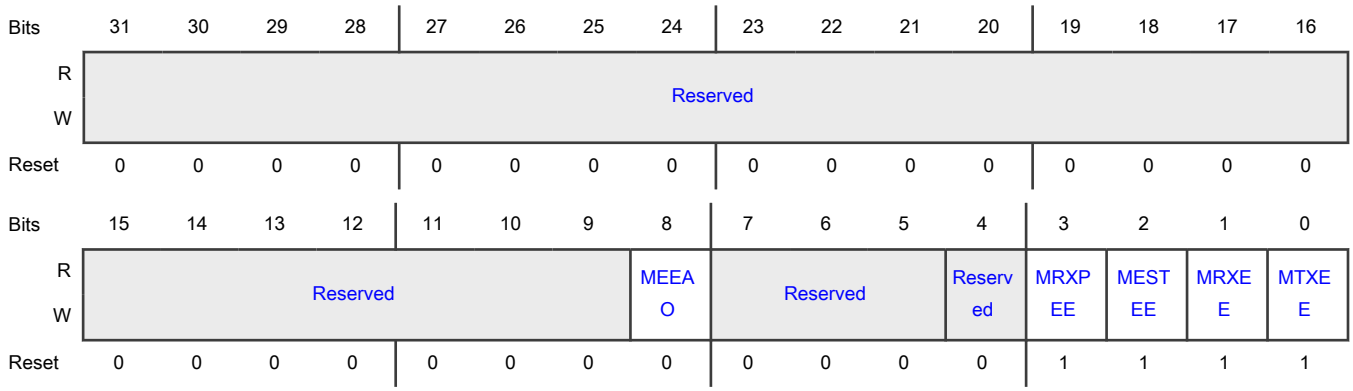
Offset

Register	Offset
MTL_ECC_Control	CC0h

Function

Establishes the operating mode of ECC related to MTL memories.

Diagram



Fields

Field	Function
31-9 —	Reserved.
8 MEEAO	MTL ECC Error Address Status Over-ride Enables or disables the MTL ECC error address status over-ride. When this field is 1, it indicates that MTL_ECC_Err_Addr_Status[EUEAS] and MTL_ECC_Err_Addr_Status[ECEAS] hold the last valid address where the error is detected. When this field becomes 0, it indicates that MTL_ECC_Err_Addr_Status[EUEAS] and MTL_ECC_Err_Addr_Status[ECEAS] hold the first address where the error is detected. 0b - Disable 1b - Enable
7-5 —	Reserved.
4 —	Reserved.
3 MRXPEE	MTL Rx Parser ECC Enable Indicates whether the MTL receive parser ECC is enabled. If this field is 1, it enables the ECC feature for receive parser memory. When this field is 0, it disables the ECC feature for receive parser memory. 0b - Disabled 1b - Enabled
2 MESTEE	MTL EST ECC Enable Indicates whether the MTL EST ECC is enabled. If this field is 1, it enables the ECC feature for EST memory. When this field is 0, it disables the ECC feature for EST memory. 0b - Disabled 1b - Enabled
1 MRXEE	MTL Rx FIFO ECC Enable Indicates whether the MTL Rx FIFO ECC is enabled. If this field is 1, it enables the ECC feature for MTL receive FIFO memory. When this field is 0, it disables the ECC feature for MTL receive FIFO memory. 0b - Disabled 1b - Enabled
0	MTL Tx FIFO ECC Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
MTXEE	Indicates whether the MTL Tx FIFO ECC is enabled. If this field is 1, it enables the ECC feature for MTL Tx FIFO memory. When field is 0, it disables the ECC feature for MTL Tx FIFO memory. 0b - Disabled 1b - Enabled

78.17.208 MTL Safety Interrupt Status (MTL_Safety_Interrupt_Status)

Offset

Register	Offset
MTL_Safety_Interrupt_Status	CC4h

Function

Provides safety interrupt status.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved	Reserved

Fields

Field	Function
31 —	Reserved Indicates whether the MAC safety uncorrectable interrupt status is detected. 0b - Not detected 1b - Detected
30-2	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
1 MEUIS	MTL ECC Uncorrectable Error Interrupt Status Indicates whether the MTL ECC uncorrectable error interrupt status is detected. Indicates that an uncorrectable error interrupt event in the MTL ECC safety feature. The application must read MTL_ECC_Interrupt_Status to get the exact cause of the interrupt. 0b - Not detected 1b - Detected
0 MECIS	MTL ECC Correctable Error Interrupt Status Indicates whether the MTL ECC correctable error interrupt status is detected. Indicates that a correctable error interrupt event in the MTL ECC safety feature. The application must read MTL_ECC_Interrupt_Status to get the exact cause of the interrupt . 0b - MTL ECC Correctable error Interrupt Status not detected 1b - MTL ECC Correctable error Interrupt Status detected

78.17.209 MTL ECC Interrupt Enable (MTL_ECC_Interrupt_Enable)

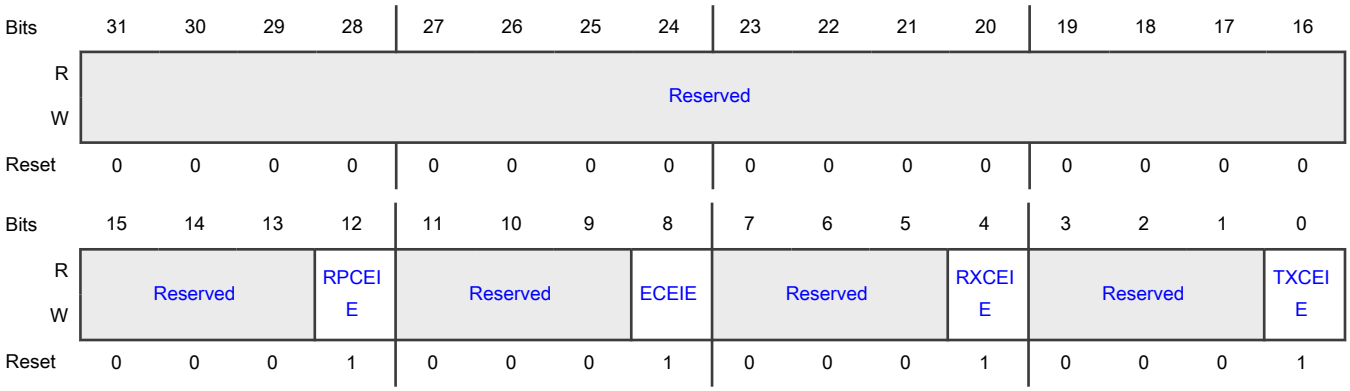
Offset

Register	Offset
MTL_ECC_Interrupt_Enable	CC8h

Function

Provides enable bits for the ECC interrupts.

Diagram



Fields

Field	Function
31-13 —	Reserved.
12 RPCEIE	Rx Parser Memory Correctable Error Interrupt Enable Indicates whether the Rx parser memory correctable error interrupt is enabled. When this field is 1, it generates an interrupt when an uncorrectable error is detected at the Rx parser memory interface. It is indicated in MTL_ECC_Interrupt_Status[RPCES]. When this field becomes 0, it indicates that this event does not generates an interrupt. 0b - Disabled 1b - Enabled
11-9 —	Reserved.
8 ECEIE	EST Memory Correctable Error Interrupt Enable Indicates whether the EST memory correctable error interrupt is enabled. When this field is 1, it generates an interrupt when a correctable error is detected at the MTL EST memory interface. It is indicated in MTL_ECC_Interrupt_Status[ECES]. When this field becomes 0, it indicates that this event does not generates an interrupt. 0b - Disabled 1b - Enabled
7-5 —	Reserved.
4 RXCEIE	Rx Memory Correctable Error Interrupt Enable Indicates whether the Rx memory correctable error interrupt is enabled. When this field is 1, it generates an interrupt when a correctable error is detected at the MTL Rx memory interface. It is indicated in MTL_ECC_Interrupt_Status[RXCES]. When this field becomes 0, it indicates that this event does not generates an interrupt. 0b - Disabled 1b - Enabled
3-1 —	Reserved.
0 TXCEIE	Tx Memory Correctable Error Interrupt Enable Indicates whether the Tx memory correctable error interrupt is enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field is 1, it generates an interrupt when a correctable error is detected at the MTL Tx memory interface. It is indicated in MTL_ECC_Interrupt_Status[TXCES]. When this field becomes 0, it indicates that this event does not generates an interrupt. 0b - Disabled 1b - Enabled

78.17.210 MTL ECC Interrupt Status (MTL_ECC_Interrupt_Status)

Offset

Register	Offset
MTL_ECC_Interrupt_Status	CCCh

Function

Provides MTL ECC Interrupt Status.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

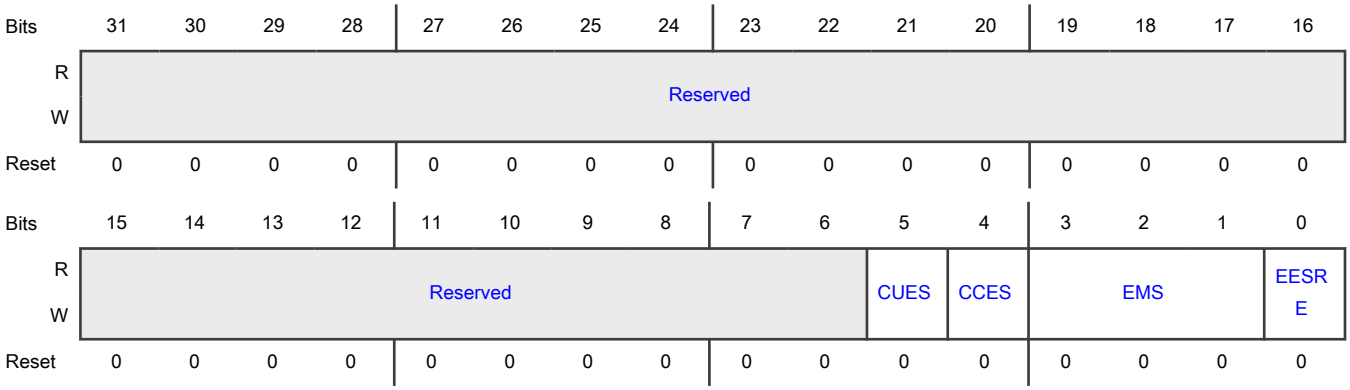
78.17.211 MTL ECC Error Status (MTL_ECC_Err_Sts_Rctl)

Offset

Register	Offset
MTL_ECC_Err_Sts_Rctl	CD0h

Function
Establishes the control for ECC error status capture.

Diagram



Fields

Field	Function
31-6 —	Reserved.
5 CUES	Clear Uncorrectable Error Status Indicates whether the clear uncorrectable error status is detected. When this field and MTL_ECC_Err_Sts_Rctl[EESRE] is 1, it indicates that based on the MTL_ECC_Err_Sts_Rctl[EMS], the respective memory's uncorrectable error address and uncorrectable error count values are cleared upon reading. When all the error status values are cleared hardware resets this field. 0b - Not detected 1b - Detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
4 CCES	Clear Correctable Error Status Indicates whether the clear correctable error status is detected. When this field and MTL_ECC_Err_Sts_Rctl[EESRE] is 1, it indicates that based on the MTL_ECC_Err_Sts_Rctl[EMS],, the respective memory's correctable error address and correctable error count values are cleared upon reading. When all the error status values are cleared, hardware resets this field. 0b - Not detected 1b - Detected
3-1 EMS	MTL ECC Memory Selection Provides the memory selection encoding. When MTL_ECC_Err_Sts_Rctl[EESRE] is 1, this field indicates which memory's error status value to be read. The memory selection encoding is as described below. 000b - MTL Tx memory 001b - MTL Rx memory 010b - MTL EST memory 011b - MTL Rx Parser memory 100b - DMA TSO memory
0 EESRE	MTL ECC Error Status Read Enable Indicates whether the MTL ECC error status read is enabled. When this field is 1, it indicates that based on MTL_ECC_Err_Sts_Rctl[EMS], the respective memory's error status values are captured as described below: • The correctable and uncorrectable error count values are captured into MTL_ECC_Err_Cnt_Status. • The address location of correctable and uncorrectable errors are captured into MTL_ECC_Err_Addr_Status. When all the status values are captured into MTL_ECC_Err_Cnt_Status and MTL_ECC_Err_Addr_Status, hardware resets this field. 0b - Disabled 1b - Enabled

78.17.212 MTL ECC Error Address Status (MTL_ECC_Err_Addr_Status)

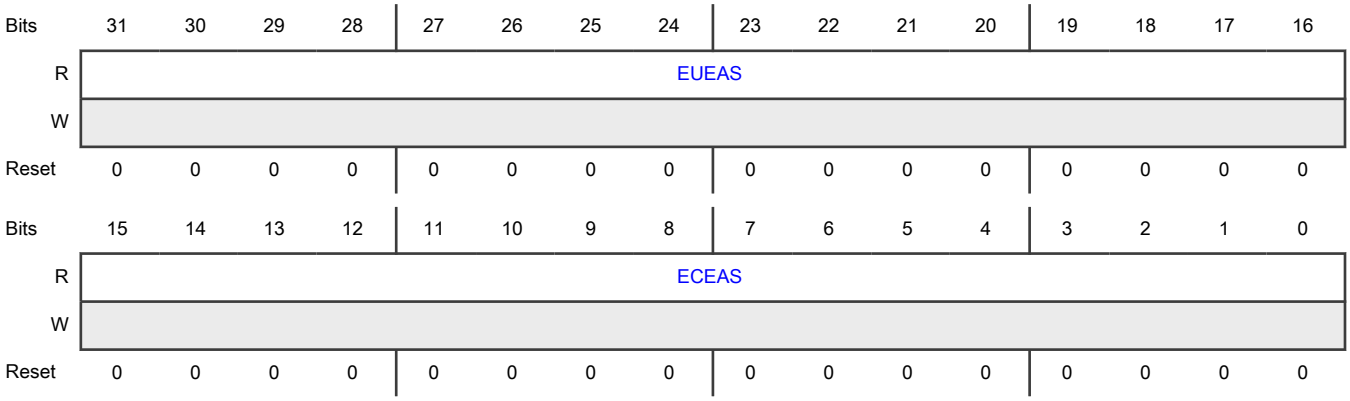
Offset

Register	Offset
MTL_ECC_Err_Addr_Status	CD4h

Function

Provides the memory addresses for the correctable and uncorrectable errors.

Diagram



Fields

Field	Function
31-16 EUEAS	MTL ECC Uncorrectable Error Address Status Based on the MTL_ECC_Err_Sts_Rctl[EMS], this field holds the respective memory's address locations for which an uncorrectable error or address mismatch is detected. When MTL_ECC_Control[MEEAO] = 1, this field holds the last valid address of memory for which either an uncorrectable error or an address mismatch is detected. When MTL_ECC_Control[MEEAO] = 0, this field holds the first address of the memory for which either an uncorrectable error or address mismatch is detected.
15-0 ECEAS	MTL ECC Correctable Error Address Status Based on the MTL_ECC_Err_Sts_Rctl[EMS], this field holds the respective memory's address locations for which a correctable error is detected. When MTL_ECC_Control[MEEAO] = 1, this field holds the last valid address of memory for which the correctable error or address mismatch is detected. When MTL_ECC_Control[MEEAO] = 0, this field holds the first address of the memory for which correctable error is detected.

78.17.213 MTL ECC Error Control Status (MTL_ECC_Err_Cntr_Status)

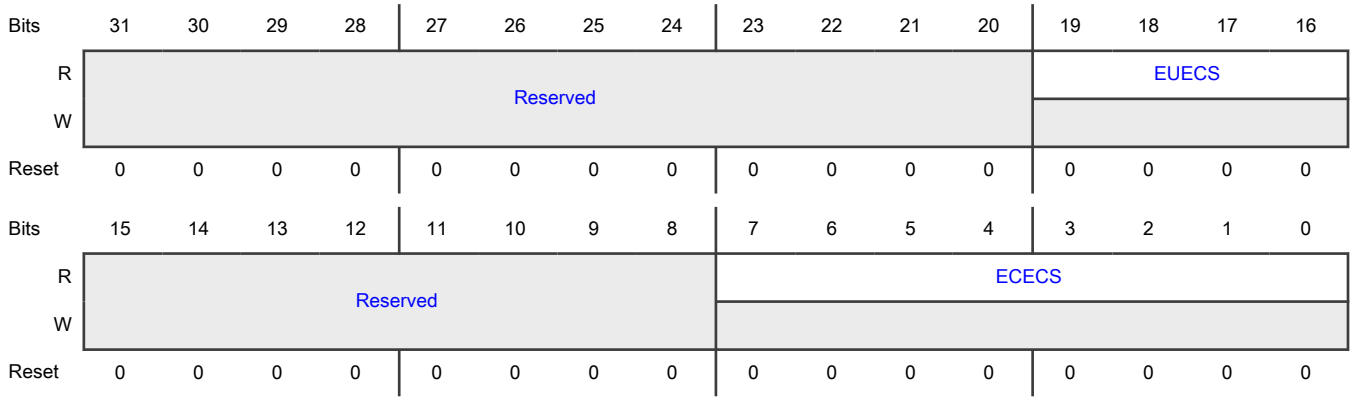
Offset

Register	Offset
MTL_ECC_Err_Cntr_Status	CD8h

Function

Provides ECC Error count for correctable and uncorrectable errors.

Diagram



Fields

Field	Function
31-20 —	Reserved.
19-16 EUECS	MTL ECC Uncorrectable Error Counter Status Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's uncorrectable error count value.
15-8 —	Reserved.
7-0 ECECS	MTL ECC Correctable Error Counter Status Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's correctable error count value.

78.17.214 MTL DPP Control (MTL_DPP_Control)

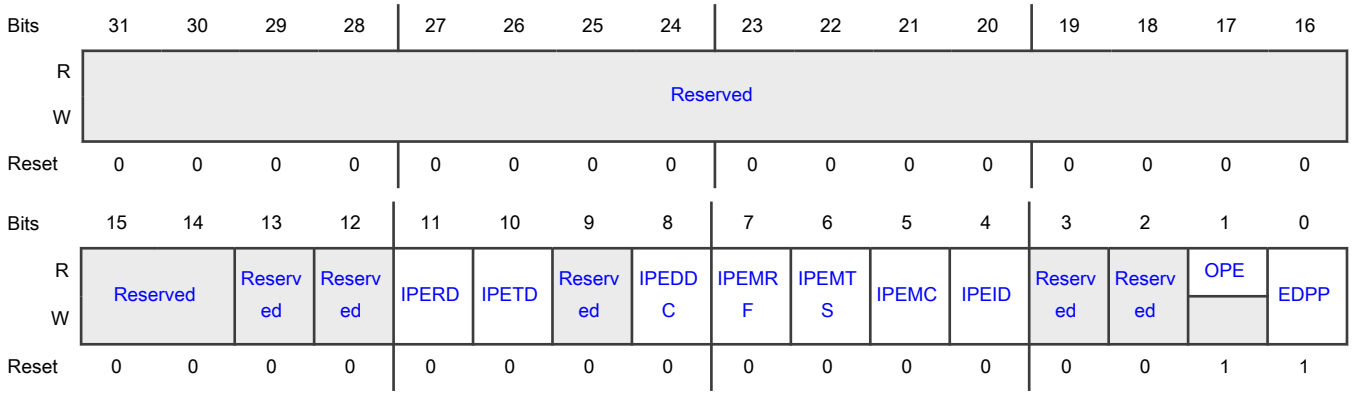
Offset

Register	Offset
MTL_DPP_Control	CE0h

Function

Establishes the operating mode of data parity protection and error injection.

Diagram



Fields

Field	Function
31-14 —	Reserved.
13 —	Reserved.
12 —	Reserved.
11 IPERD	Insert Parity error in Rx write-back Descriptor parity generator Indicates whether the insert parity error in receive write-back descriptor parity generator is enabled. When this field is 1, it flips the parity bit of first valid data to which the DMA Rx write-back descriptor parity generator(or at PG8 as shown in Receive data path parity protection diagram) generates. 0b - Disabled 1b - Enabled
10 IPETD	Insert Parity error in Tx write-back Descriptor parity generator Indicates whether the insert parity error in transit write-back descriptor parity generator is enabled. When this field is 1, it flips the parity bit of first valid data to which the DMA Tx write-back descriptor parity generator(or at PG4 as shown in Transmit data path parity protection diagram) generates. Hardware clears this field, when the respective parity bit flips. 0b - Disabled 1b - Enabled
9 —	Reserved.
8	Insert Parity Error in DMA DTX Control Word Parity Generator

Table continues on the next page...

Table continued from the previous page...

Field	Function
IPEDDC	Indicates whether the insert parity error in DMA DTX control word parity generator is enabled. When this field is 1, it flips the parity bit of first valid data to which the DMA DTX Control word parity generator (or at PG2 as shown in Transmit data path parity protection diagram) generates. Hardware clears this field, when the respective parity bit flips. 0b - Disabled 1b - Enabled
7 IPEMRF	Insert Parity Error in MTL Rx FIFO Read Control Parity Generator Inserts parity Error in MTL receive FIFO read control parity generator. When this field is 1, it flips the parity bit of first valid data to which the MTL Rx FIFO read control parity generator (or at PG7 as shown in Receive data path parity protection diagram) generates. Hardware clears this field, when the respective parity bit flips. 0b - Disabled 1b - Enabled
6 IPEMTS	Insert Parity Error in MTL Tx Status Parity Generator Indicates whether the insert parity error in MTL transit status parity generator is enabled. When this field is 1, it flips the parity bit of first valid data to which the MTL Tx Status parity generator (or at PG6 as shown in Transmit data path parity protection diagram) generates. Hardware clears this field, when the respective parity bit flips. 0b - Disabled 1b - Enabled
5 IPEMC	Insert Parity Error in MTL Checksum Parity Generator Indicates whether the insert parity error in MTL checksum parity generator is enabled. When this field is 1, it flips the parity bit of first valid data to which the MTL checksum parity generator (or at PG5 as shown in Transmit data path parity protection diagram) generates. Hardware clears this field, when the respective parity bit flips. 0b - Disabled 1b - Enabled
4 IPEID	Insert Parity Error in Interface Data Parity Generator Indicates whether the insert parity error in interface data parity generator is enabled. When this field is 1, it flips the parity bit of first valid input data to which the interface data parity generator (or at PG1 as shown in Transmit data path parity protection diagram) generates. Following are the input data bus on which parity bits are generated on the basis of configuration selected. In AHB Config, hrdata_i In AXI config, rdata_m_i

Table continues on the next page...

Table continued from the previous page...

Field	Function
	In DMA Config, mdc_rdata_i In MTL Config, ati_data_i Hardware clears this field, when the respective parity bit flips. 0b - Disabled 1b - Enabled
3 —	Reserved.
2 —	Reserved.
1 OPE	Odd Parity Enable Indicates whether an odd parity protection is enabled. When this field is 1, it enables an odd parity protection on all the external interfaces and when this field is 0, it enables an even parity protection on all the external interfaces. 0b - Disabled 1b - Enabled
0 EDPP	Enable Data path Parity Protection Enables or disables the data path parity protection. When this field is 1, it indicates that by generating and checking the parity on EQOS datapath it enables the parity protection for EQOS datapath . When this field is 0, it disables the parity protection for EQOS datapath. 0b - Disable 1b - Enable

78.17.215 MTL Tx Queue 0 Operation Mode (MTL_TxQ0_Operation_Mode)

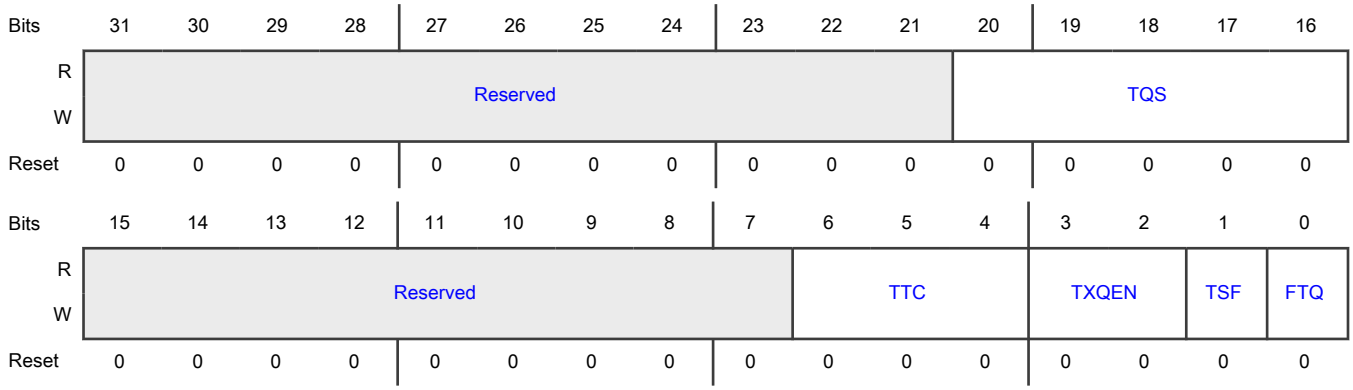
Offset

Register	Offset
MTL_TxQ0_Operation_Mode	D00h

Function

Establishes the transmit queue operating modes and commands.

Diagram



Fields

Field	Function
31-21 —	Reserved.
20-16 TQS	Transmit Queue Size Indicates the size of the allocated transmit queues in blocks of 256 bytes. This field is read-write only if the number of transit queues are more than one, the reset value is 0x0 and indicates 256 bytes size. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. You must program TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes . In general, the size of the Queue = (TQS+1)*256 bytes. When the number of transit queue is one, the field is read-only and the reset value reflects the configured TX FIFO size in blocks of 256 bytes. The field's width depends on the transit memory size selected in your configuration. For example, if the memory size is 2048, the field's width is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved.
6-4 TTC	Transmit Threshold Control Controls the threshold level of the MTL transit queue. The transmission starts when the packet size within the MTL transit queue is larger than the threshold, also transmits full packets with length less than the threshold. These fields are used only when MTL_TxQ0_Operation_Mode[TSF] resets. 000b - 32 001b - 64 010b - 96 011b - 128 100b - 192 101b - 256

Table continues on the next page...

Table continued from the previous page...

Field	Function
	110b - 384 111b - 512
3-2 TXQEN	Transmit Queue Enable Enables or disables the transmit queue 0. 2'b00 - Not enabled 2'b01 - Reserved 2'b10 - Enabled 2'b11 - Reserved This field is read only in single queue configurations and read write in multiple queue configurations. **NOTE** In multiple transit queue configuration, all the queues disables by default and programming this field enables the transit queue. 00b - Not enabled 01b - Enable in AV mode (Reserved in non-AV) 10b - Enabled 11b - Reserved
1 TSF	Transmit Store and Forward Indicates whether the transmit store and forward is enabled. When this field is 1, it indicates that the transmission starts when a full packet resides in the MTL transit queue and the TTC values specified in Bits[6:4] of this register are ignored. This field must be changed only when you stop the transmission. 0b - Disabled 1b - Enabled
0 FTQ	Flush Transmit Queue Indicates whether the flush transmit queue is enabled. When this field is 1, it indicates that the transit queue controller logic resets to its default values. Therefore, all the data in the transit queue is lost or flushed. After the flushing operation completes this field resets internally. You must not write to the MTL_TxQ1_Operation_Mode until this field resets. The data to which the MAC transmitter has already accepted is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. **NOTE** The flush operation completes only when the transit queue is empty and the application accepts the pending transit status of all the transmitted packets. To complete the flush operation, the PHY Tx clock (clk_tx_i) must be active.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It clears automatically. Writing 1 sets this field and writing 0 has no effect. 0b - Disabled 1b - Enabled

78.17.216 MTL Tx Queue 0 Underflow (MTL_TxQ0_Underflow)

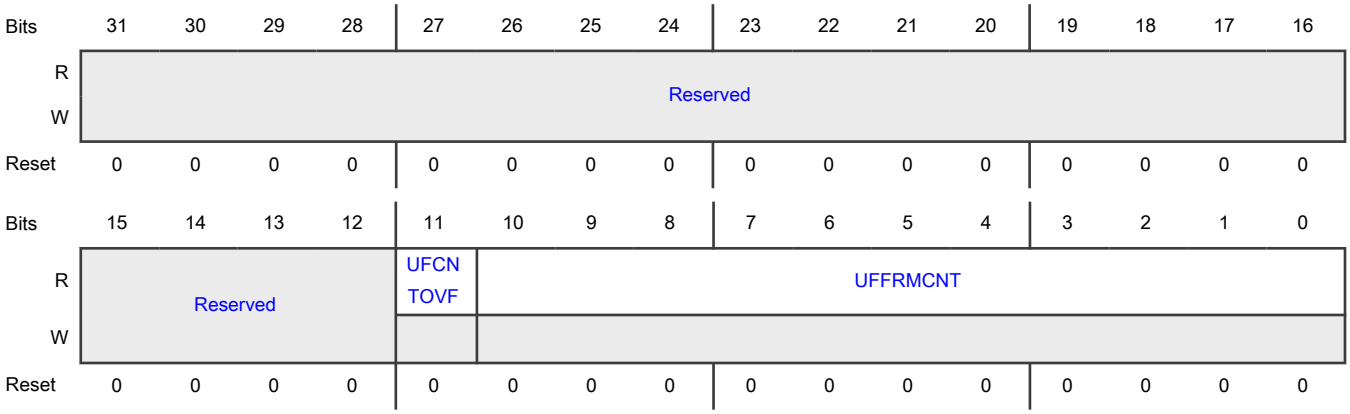
Offset

Register	Offset
MTL_TxQ0_Underflow	D04h

Function

Contains the counter for packets aborted because of transmit queue underflow and packets missed because of receive queue packet flush.

Diagram



Fields

Field	Function
31-12 —	Reserved.
11 UFCNTOVF	Overflow Bit for Underflow Packet Counter Indicates whether the overflow is detected for underflow packet counter.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field is 1, when the transit queue underflow packet counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter resets to all-zeros and this field indicates that the rollover occurred. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
10-0 UFFRMCNT	Underflow Packet Counter Indicates the number of packets aborted by the controller because of transit queue underflow. This counter increments each time the MAC aborts outgoing packet because of underflow. The counter clears when this register is read with mci_be_i[0] at 1'b1. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence.

78.17.217 MTL Tx Queue 0 Debug (MTL_TxQ0_Debug)

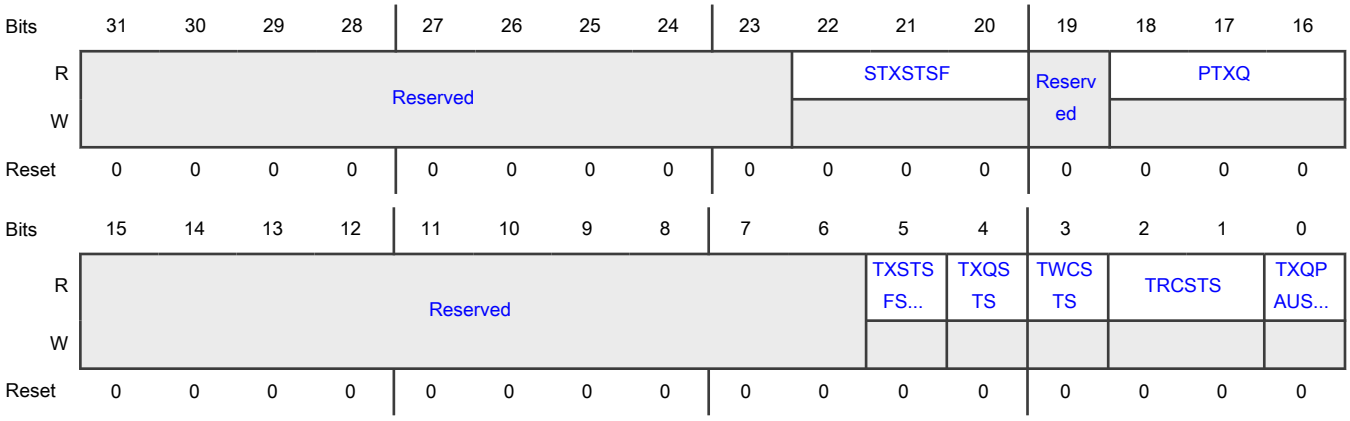
Offset

Register	Offset
MTL_TxQ0_Debug	D08h

Function

Provides the debug status of various blocks related to the transmit queue.

Diagram



Fields

Field	Function
31-23 —	Reserved.
22-20 STXSTSF	Number of Status Words in Tx Status FIFO of Queue Indicates the current number of status in the transit status FIFO of this queue. This field does not reflect the number of status words in transit status FIFO, when MTL_Operation_Mode[DTXSTS] = 1.
19 —	Reserved.
18-16 PTXQ	Number of Packets in the Transmit Queue Indicates the current number of packets in the transit queue. This field does not reflect the number of packets in the transmit queue, when MTL_Operation_Mode[DTXSTS] = 1.
15-6 —	Reserved.
5 TXSTSFSTS	MTL Tx Status FIFO Full Status Indicates whether the MTL transit status and FIFO full status is detected. When this field is 1, it indicates that the MTL transit status FIFO is full. Therefore, MTL cannot accept any more packets for transmission. 0b - Not detected 1b - Detected
4 TXQSTS	MTL Tx Queue Not Empty Status Indicates whether the MTL transit queue not empty status is detected. When this field is high, it indicates that the MTL transit queue is not empty and some data is left for transmission. 0b - Not detected 1b - Detected
3 TWCSTS	MTL Tx Queue Write Controller Status Indicates whether the MTL transit queue write controller status is detected. When high, this field indicates that the MTL transit queue write controller is active, and transfers the data to the transit queue. 0b - Not detected 1b - Detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
2-1 TRCSTS	MTL Tx Queue Read Controller Status Indicates the state of the transit queue read controller. 00b - Idle state 01b - Read state (transferring data to the MAC transmitter) 10b - Waiting for pending transit status from the MAC transmitter 11b - Flushing the transit queue because of the packet abort request from the MAC
0 TXQPAUSED	Transmit Queue in Pause Indicates whether the transmit queue in pause is detected. When this field is 1 and the receive flow control is enabled, it indicates that the transit queue is in the pause condition (in the full-duplex only mode) because of the following scenario: • Receives PFC packet with the priorities assigned to the transit queue when PFC is enabled. • Receives 802.3x pause packet when PFC is disabled. 0b - Not detected 1b - Detected

78.17.218 MTL Tx Queue 0 ETS Status (MTL_TxQ0_ETS_Status)

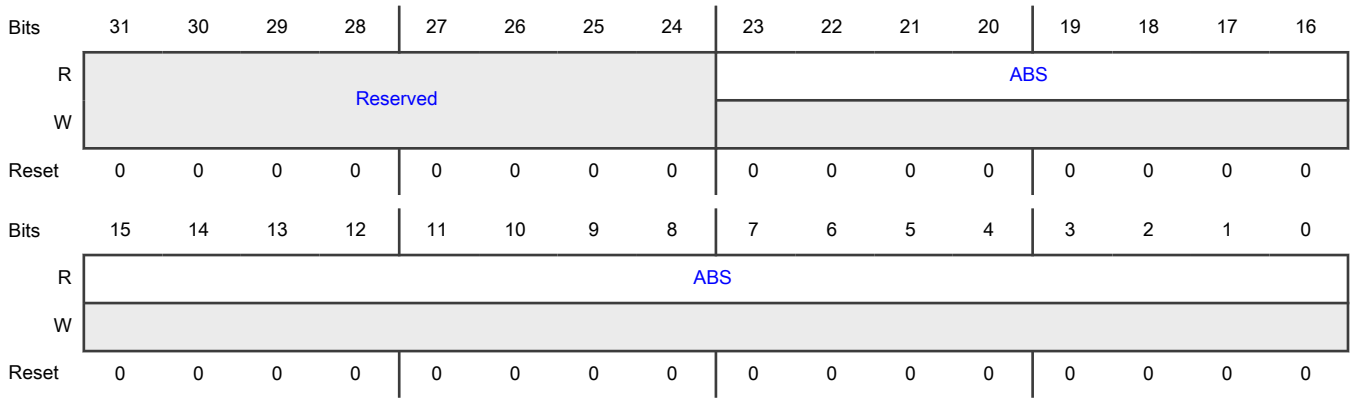
Offset

Register	Offset
MTL_TxQ0_ETS_Status	D14h

Function

Provides the average traffic transmitted in queue 0.

Diagram



Fields

Field	Function
31-24 —	Reserved.
23-0 ABS	Average Bits per Slot Contains the average transmitted bits per slot. Computes over every 10 million bit times slot (4 ms in 2500 Mbit/s; 10 ms in 1000 Mbit/s; 100 ms in 100 Mbit/s), when the DCB operation enables for queue 0. The maximum value is 0x989680.

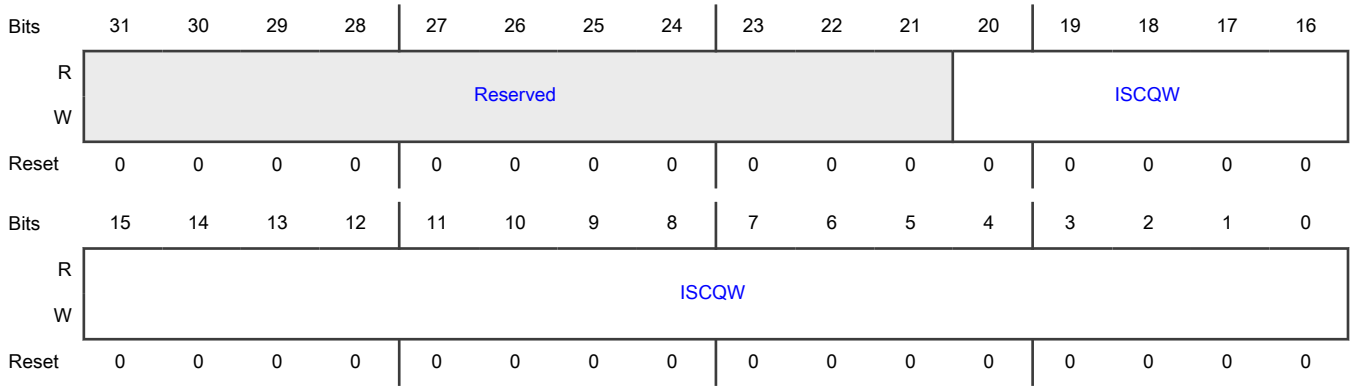
78.17.219 MTL Tx Queue Quantum Weight (MTL_TxQ0_Quantum_Weight)

Offset

Register	Offset
MTL_TxQ0_Quantum_Weight	D18h

Function
Contains the quantum value for Deficit Weighted Round Robin (DWRR), weights for the Weighted Round Robin (WRR), and Weighted Fair Queuing (WFQ) for queue 0.

Diagram



Fields

Field	Function
31-21 —	Reserved.
20-0	Quantum or Weights

Table continues on the next page...

Table continued from the previous page...

Field	Function
ISCQW	Contains the quantum value in bytes which is added to credit during every queue scanning cycle, when DCB operation enables with DWRR algorithm for queue 0 traffic. The maximum value is 0x1312D0 bytes. Contains the weight for this queue, when DCB operation enables with WFQ algorithm for queue 0 traffic. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Write 0 to bits[20:14]. The higher the programmed weights, the lesser is the bandwidth that is allocated for the particular transmit queue. This is because the weights compute the packet finish time (weights*packet_size). The lesser the finish time, the higher is the probability of the packet getting scheduled first and consuming more bandwidth. Contains the weight for this queue, when DCB operation or generic queuing operation enables with WRR algorithm for queue 0 traffic. The maximum value is 0x64. Write 0 to bits [20:7].

78.17.220 MTL Queue 0 Interrupt Control Status (MTL_Q0_Interrupt_Control_Status)

Offset

Register	Offset
MTL_Q0_Interrupt_Control_Status	D2Ch

Function

Contains the interrupt enable and status bits for the queue 0 interrupts.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved							RXOIE	Reserved							RXOVFIS
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-25 —	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
24 RXOIE	Receive Queue Overflow Interrupt Enable Enables or disables the receive queue overflow interrupt. When this field is 1, it enables the receive queue overflow interrupt. When this field becomes 0, it disables the receive queue overflow interrupt. 0b - Disabled 1b - Enabled
23-17 —	Reserved.
16 RXOVFIS	Receive Queue Overflow Interrupt Status Indicates whether the status of receive queue overflow interrupt is detected. This bit indicates that the receive queue had an overflow when you receive the packet. If you transfer a partial packet to the application, the overflow status sets in RDES3[21]. This field is 0 when the application writes 1 to it. Access restriction apply to this field. It becomes 0 automatically on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
15-10 —	Reserved.
9 ABPSIE	Average Bits Per Slot Interrupt Enable Enables or disables the average bits per slot interrupt. When this field is 1, it indicates that when you update the average bits per slot status, the MAC asserts the sbd_intr_o or mci_intr_o interrupt. When this field is 0, it indicates that the interrupt do not assert for such an event. 0b - Disabled 1b - Enabled
8 TXUIE	Transmit Queue Underflow Interrupt Enable Enables or disables transmit queue underflow interrupt. When this field is 1, it enables the transmit queue underflow interrupt. When this field becomes 0, it disables the transmit queue underflow interrupt. 0b - Disabled 1b - Enabled
7-2	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
1 ABPSIS	Average Bits Per Slot Interrupt Status Indicates whether the status of average bits per slot interrupt is detected. When this field is 1, it indicates that the MAC has updated the ABS value. This field is 0 when the application writes 1 it. Access restriction apply to this field. It becomes 0 automatically on an internal event occurrence. Writing 1 sets this field and writing 0 has no effect. 0b - Not detected 1b - Detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status Indicates whether the status of transmit queue underflow interrupt is detected. This field indicates that, when you transmit the packet,the transmit queue had an underflow. Suspend the transmission and write 1 to an underflow error TDES3[2]. This field is 0, when the application writes 1 to it. Access restriction apply to this field. It becomes 0 automatically on an internal event occurrence. Writing 1 sets this field and writing 0 has no effect. 0b - Not detected 1b - Detected

78.17.221 MTL Rx Queue 0 Operation Mode (MTL_RxQ0_Operation_Mode)

Offset

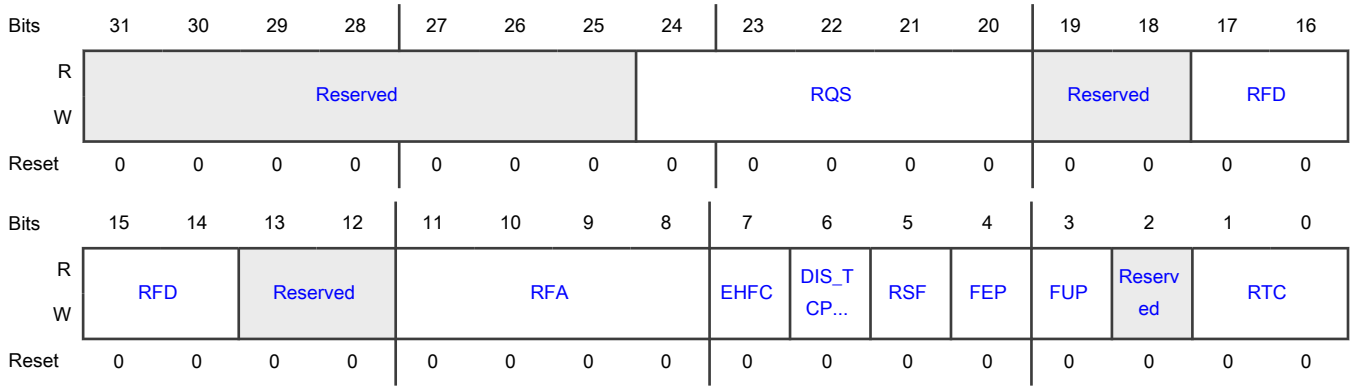
Register	Offset
MTL_RxQ0_Operation_Mode	D30h

Function

Establishes the receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Diagram



Fields

Field	Function
31-25 —	Reserved.
24-20 RQS	Receive Queue Size Indicates the size of the allocated receive queues in blocks of 256 bytes. The MTL_RxQ0_Operation_Mode[RQS] is read-write only if the number of receive queues are more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. You must program RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of receive queues is one, the field is read-only and the configured receive FIFO size in blocks of 256 bytes is reflected in the reset value. The field width depends on the receive memory size selected in your configuration. For example, if the memory size is 2048, the field width is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved.
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) Controls the threshold (fill-level of Rx queue) at which the flow control is de-asserts after activation. 0 - Full minus 1 KB, that is, FULL 1 KB 1 - Full minus 1.5 KB, that is, FULL 1.5 KB 2 - Full minus 2 KB, that is, FULL 2 KB 3 - Full minus 2.5 KB, that is, FULL 2.5 KB ... 14 - Full minus 8 KB, that is, FULL 8 KB 15 - Full minus 8.5 KB, that is, FULL 8.5 KB

Table continues on the next page...

Table continued from the previous page...

Field	Function
	De-assertion is effective only after flow control is asserted. **NOTE** You must program the value in such a way that the threshold is a positive number. When MTL_RxQ0_Operation_Mode[EHFC] = 1, these values are applicable only when the receive queue size which the MTL_RxQ0_Operation_Mode[RQS] determines is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size which the MTL_RxQ0_Operation_Mode[RQS] determines. The field width depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved.
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex) Controls the threshold (fill-level of receive queue) at which the flow control is activated. See MTL_RxQ0_Operation_Mode[RFD] for more information on encoding for this field.
7 EHFC	Enable Hardware Flow Control Enables or disables hardware flow control. If this field is 1, it enables the flow control signal operation, on the basis of the fill-level of receive queue. When this field becomes 0, it disables the flow control operation. 0b - Disable 1b - Enable
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets Enables or disable dropping of TCP or IP checksum error packets. When this field is 1, it indicates that the MAC does not drop the packets which only have the errors which the receive checksum offload engine detects. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this field becomes 0, it indicates that all error packets are dropped if MTL_RxQ0_Operation_Mode[FEP] resets. 0b - Enable 1b - Disable
5 RSF	Receive Queue Store and Forward Indicates whether the receive queue store and forward is enabled. When this field is 1, it indicates that the module reads a packet from the receive queue only after the complete packet has been written to it, ignores the MTL_RxQ0_Operation_Mode[RTC].

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field becomes 0, it indicates that the receive queue operates in the Threshold (cut-through) mode, subject to the threshold which the MTL_RxQ0_Operation_Mode[RTC] specifies. 0b - Disabled 1b - Enabled
4 FEP	Forward Error Packets Indicates whether the forward error packets are enabled. When this field becomes 0, it indicates that the receive queue drop packets with an error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, the packet does not drop if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode). When this field is 1, it indicates that all packets except the runt error packets are forwarded to the application or DMA. The packet is dropped irrespective of the setting of this field, if MTL_RxQ0_Operation_Mode[RSF] is 1 and the receive queue overflows when a partial packet is written. However, if MTL_RxQ0_Operation_Mode[RSF] becomes 0 and the receive queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0b - Disabled 1b - Enabled
3 FUP	Forward Undersized Good Packets Indicates whether the forward undersized good packets are enabled. When this field is 1, it indicates that the receive queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this field becomes 0, it indicates that the receive queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of receive threshold, for example, MTL_RxQ0_Operation_Mode[RTC] = 01. 0b - Disabled 1b - Enabled
2 —	Reserved.
1-0 RTC	Receive Queue Threshold Control Controls the threshold level of the MTL receive queue (in bytes). The received packet is transferred to the application or DMA when the packet size within the MTL receive queue is larger than the threshold. In addition, automatically transfer full packets with length less than the threshold. This field is valid only when MTL_RxQ0_Operation_Mode[RSF] = 0. This field is ignored when MTL_RxQ0_Operation_Mode[RSF] = 1. 00b - 64

Table continues on the next page...

Fields

Field	Function
31-28 —	Reserved.
27 MISCNTOVF	Missed Packet Counter Overflow Bit Indicates whether the missed packet counter overflow is detected. When this field is 1, it indicates that the receive queue missed packet counter has crossed the maximum limit.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
26-16 MISPKTCNT	Missed Packet Counter Indicates the number of packets this module has missed because the application asserts ari_pkt_flush_i[] for this queue. This counter resets when this register reads with mci_be_i[0] at 1b1. This counter increments by 1 when the DMA discards the packet because of buffer unavailability. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence.
15-12 —	Reserved.
11 OVFCNTOVF	Overflow Counter Overflow Bit Indicates whether the counter overflow is detected. When this field is 1, it indicates that the receive queue overflow packet counter field has crossed the maximum limit. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
10-0 OVFPKTCNT	Overflow Packet Counter Indicates the number of packets which this module discards because of receive queue overflow. This counter increments each time the module discards an incoming packet because of overflow. This counter resets when this register reads with mci_be_i[0] at 1'b1. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence.

78.17.223 MTL Rx Queue 0 Debug (MTL_RxQ0_Debug)

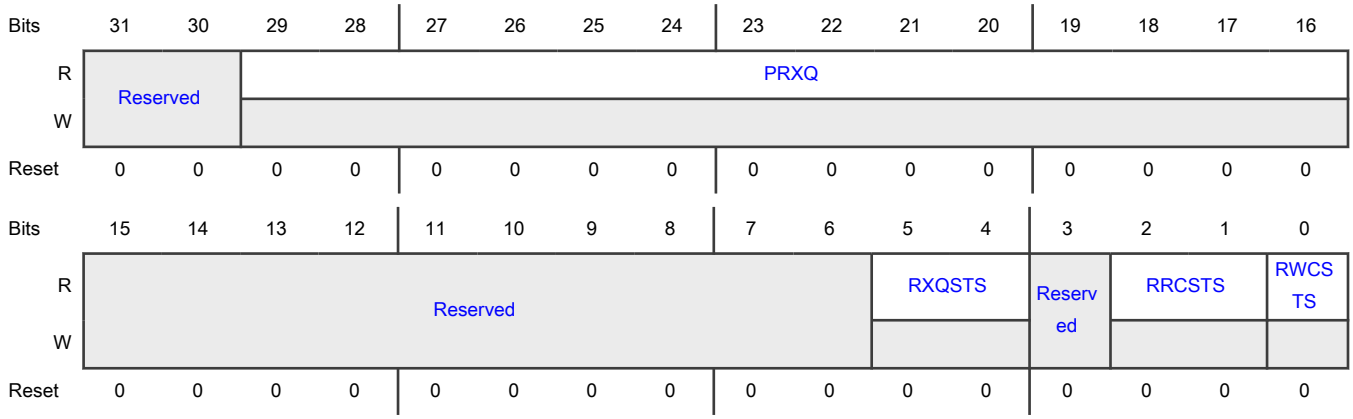
Offset

Register	Offset
MTL_RxQ0_Debug	D38h

Function

Provides the debug status of various blocks related to the receive queue.

Diagram



Fields

Field	Function
31-30 —	Reserved.
29-16 PRXQ	Number of Packets in Receive Queue Indicates the current number of packets in the receive queue. The theoretical maximum value for this field is 256KB/16B = 16K packets, that is, Max_Queue_Size/Min_Packet_Size.
15-6 —	Reserved.
5-4 RXQSTS	MTL Rx Queue Fill-Level Status Provides the status of the receive queue fill-level. 00b - Rx Queue empty 01b - Rx Queue fill-level below flow-control deactivate threshold 10b - Rx Queue fill-level above flow-control activate threshold 11b - Rx Queue full
3 —	Reserved.
2-1 RRCSTS	MTL Rx Queue Read Controller State Provides the state of the receive queue read controller. 00b - Idle state 01b - Reading packet data 10b - Reading packet status (or timestamp) 11b - Flushing the packet data and status

Table continues on the next page...

Table continued from the previous page...

Field	Function
0 RWCSTS	MTL Rx Queue Write Controller Active Status Indicates whether the MTL receive queue write controller active status is detected. When high, this bit indicates that the MTL receive queue write controller is active, and it is transferring a received packet to the receive queue. 0b - Not detected 1b - Detected

78.17.224 MTL Rx Queue 0 Control 0 (MTL_RxQ0_Control)

Offset

Register	Offset
MTL_RxQ0_Control	D3Ch

Function

Controls the receive arbitration and passing of received packets to the application.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved												RXQ_FRM...	RXQ_WEGT		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-4 —	Reserved.
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration Indicates whether the receive queue packet arbitration is enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field is 1, it indicates that the module drives the packet data to the ARI interface such that the entire packet data of currently-selected queue transmits before switching to other queue. When this field becomes 0, it indicates that the module drives the packet data to the ARI interface such that the following amount of data of currently-selected queue transmits before switching to other queue: • PBL amount of data (indicated by ari_qN_pbl_i[]), or • Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the module drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0b - Disabled 1b - Enabled
2-0 RXQ_WEGT	Receive Queue Weight Indicates the weight assigned to receive queue 0. You must write a value to this field that is 1 less than the required queue weight. Therefore, if this field is 0, it indicates that the queue weight is 1, if this field is 1, it indicates that the queue weight is 2, and so on. You must use this weight to calculate the number of continuous PBL or packet requests, depending on the value of RXQ_FRM_ARBIT, allocated to the queue in an arbitration cycle. The field's value changes when the current service round completes or when there is a change from RAA=SP to RAA=WSP algorithm. This approach is required for a smooth transition. You must configure MTL Rx Queue 0 Control 0 (MTL_RxQ0_Control) before MTL Operation Mode (MTL_Operation_Mode) if you want to change the field's value before either of these two processes completes.

78.17.225 MTL Tx Queue 1 Operation Mode (MTL_TxQ1_Operation_Mode)

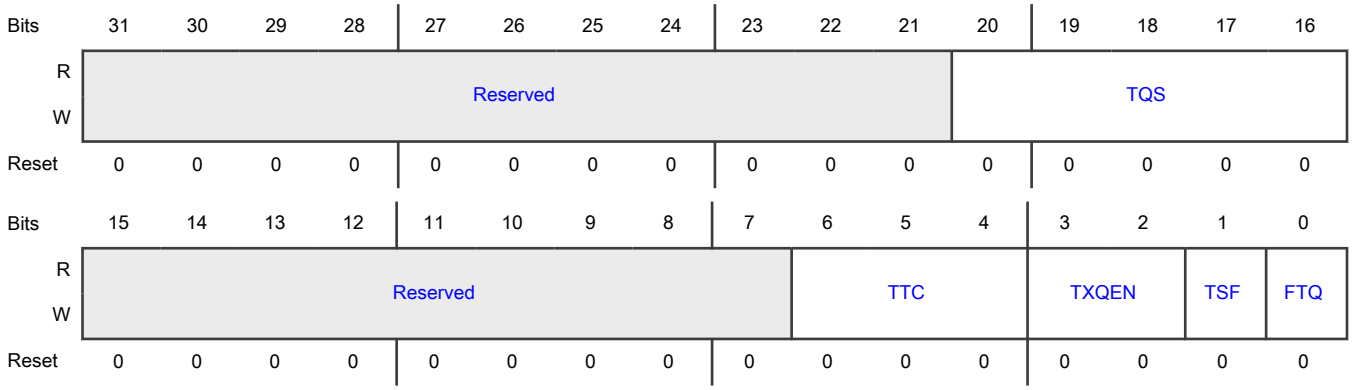
Offset

Register	Offset
MTL_TxQ1_Operation_Mode	D40h

Function

Establishes the transmit queue operating modes and commands.

Diagram



Fields

Field	Function
31-21 —	Reserved.
20-16 TQS	Transmit Queue Size Indicates the size of the allocated transmit queues in blocks of 256 bytes. This field is read-write only if the number of transit queues is more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. You must program TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the queue = (TQS+1)*256 bytes. When the number of transit queues is one, the field is read-only and the reset value reflects the configured TX FIFO size in blocks of 256 bytes. The field width depends on the transit memory size selected in your configuration. For example, if the memory size is 2048, the field width is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved.
6-4 TTC	Transmit Threshold Control Controls the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, it also transmit full packets with length less than the threshold. These fields are used only when the MTL_TxQ1_Operation_Mode[TSF] resets. 000b - 32 001b - 64 010b - 96 011b - 128 100b - 192 101b - 256

Table continues on the next page...

Table continued from the previous page...

Field	Function
	110b - 384 111b - 512
3-2 TXQEN	Transmit Queue Enable Enables or disables the transmit queue 0. 2'b00 - Not enabled 2'b01 - Enable in AV mode 2'b10 - Enabled 2'b11 - Reserved **NOTE** All the queues disables by default, in multiple transit queues configuration. You must program this field to enable the transit queue. 00b - Not enabled 01b - Enable in AV mode (Reserved in non-AV) 10b - Enabled 11b - Reserved
1 TSF	Transmit Store and Forward Indicates whether the transmit store and forward is enabled. When this field is 1, it indicates that the transmission starts when full packet resides in the MTL transit queue and the TTC values specified in MTL_TxQ1_Operation_Mode[TTC] are ignored. This field must change only when the transmission stops. 0b - Transmit Store and Forward is disabled 1b - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue Indicates whether the flush transmit queue is enabled. When this field is 1, it indicates that the transmit queue controller logic resets to its default values. Therefore, all the data in the transit queue is lost or flushed. This field resets internally when the flushing operation completes. Until this field becomes 0, you must not write to MTL_TxQ1_Operation_Mode. The data which the MAC transmitter has already accepted is not flushed. It is scheduled for transmission and results in an underflow and runt packet transmission. **NOTE** The flush operation completes only when the transit queue is empty and the application has accepted the pending transit status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) must be active. Access restriction apply to this field. Writing 1 sets this field and it clears automatically. Writing 0 has no effect.

Table continues on the next page...

	0b - Disabled 1b - Enabled

78.17.226 MTL Tx Queue 1 Underflow (MTL_TxQ1_Underflow)

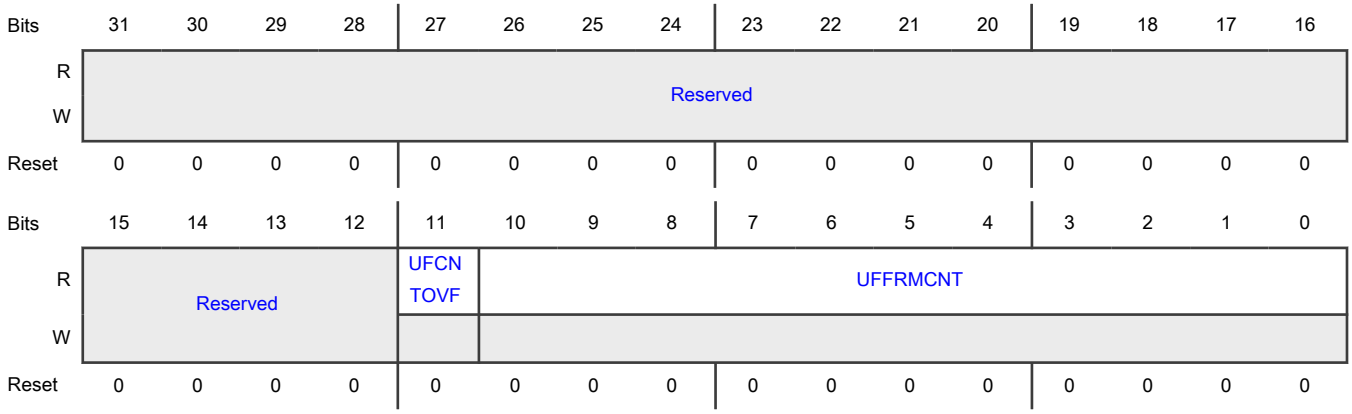
Offset

Register	Offset
MTL_TxQ1_Underflow	D44h

Function

Contains the counter for packets aborted because of transmit queue underflow and packets missed because of receive queue packet flush.

Diagram



Fields

Field	Function
31-12 —	Reserved.
11 UFCNTOVF	Overflow Bit for Underflow Packet Counter Indicates whether the overflow is detected for underflow packet counter. When this field is 1, it indicates that every time the transit queue underflow packet counter field overflows, that is, it has crossed the maximum count. In such case, the overflow packet counter resets to all-zeros and this field indicates that the rollover have occurred.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
10-0 UFFRMCNT	Underflow Packet Counter Indicates the number of packets which the controller abort because of transit queue underflow. This counter increments each time the MAC aborts outgoing packet because of underflow. The counter clears when this register is read with mci_be_i[0] at 1'b1. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence.

78.17.227 MTL Tx Queue 1 Debug (MTL_TxQ1_Debug)

Offset

Register	Offset
MTL_TxQ1_Debug	D48h

Function

Provides the debug status of various blocks related to the transmit queue.

Diagram

Fields

Field	Function
31-23	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
22-20 STXSTSF	Number of Status Words in Tx Status FIFO of Queue Indicates the current number of status in the transit status FIFO of this queue. When MTL_Operation_Mode[DTXSTS] = 1, this field does not reflect the number of status words in transit status FIFO.
19 —	Reserved.
18-16 PTXQ	Number of Packets in the Transmit Queue Indicates the current number of packets in the transit queue. When MTL_Operation_Mode[DTXSTS] = 1, this field does not reflect the number of packets in the transmit queue.
15-6 —	Reserved.
5 TXSTSFSTS	MTL Tx Status FIFO Full Status Indicates whether the MTL transit status FIFO full status is detected. When this field is 1, it indicates that the MTL transit status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0b - Not detected 1b - Detected
4 TXQSTS	MTL Tx Queue Not Empty Status Indicates whether the MTL transit queue not empty status is detected. When this field is 1, it indicates that the MTL transit queue is not empty and some data is left for transmission. 0b - Not detected 1b - Detected
3 TWCSTS	MTL Tx Queue Write Controller Status Indicates whether the MTL transit queue write controller status is detected. When this field is 1, it indicates that the MTL transit queue write controller is active, and it is transferring the data to the transit queue. 0b - Not detected 1b - Detected
2-1 TRCSTS	MTL Tx Queue Read Controller Status Indicates the state of the transit queue read controller.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	00b - Idle state 01b - Read state (transferring data to the MAC transmitter) 10b - Waiting for pending transit status from the MAC transmitter 11b - Flushing the transit queue because of the packet abort request from the MAC
0 TXQPAUSED	Transmit Queue in Pause Indicates whether the transmit queue in pause status is detected. When this field is 1 and the receive flow control is enabled, it indicates that the transit queue is in the pause condition (in the full-duplex only mode) because of these scenarios: • Reception of the PFC packet for the priorities assigned to the transit queue when PFC is enabled. • Reception of 802.3x pause packet when PFC is disabled. 0b - Not detected 1b - Detected

78.17.228 MTL Tx Queue 1 ETS Control (MTL_TxQ1_ETS_Control)

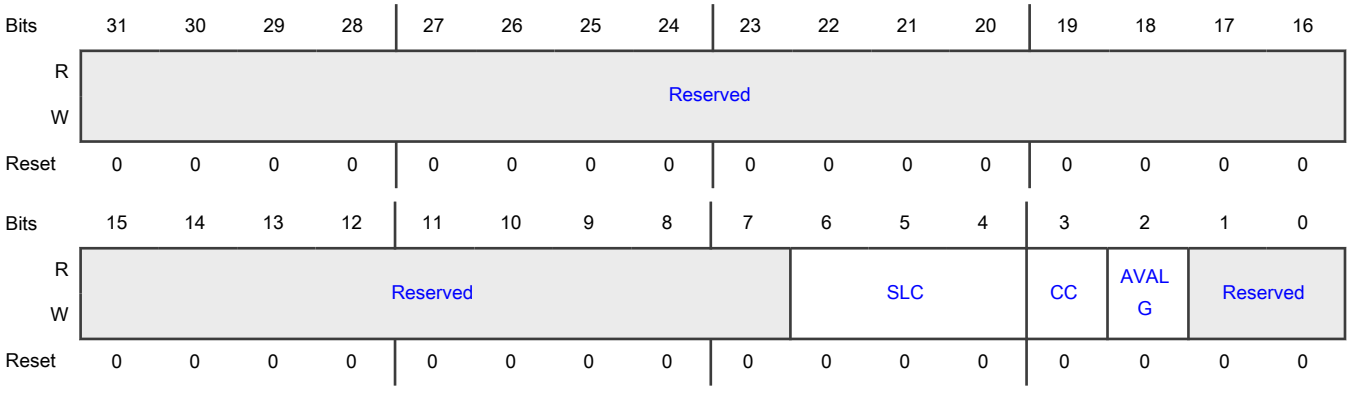
Offset

Register	Offset
MTL_TxQ1_ETS_Control	D50h

Function

Controls the enhanced transmission selection operation.

Diagram



Fields

Field	Function
31-7 —	Reserved.
6-4 SLC	Slot Count If the credit-based shaper algorithm is enabled, then you can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, is computed for queue. The encoding is as follows: 000b - 1 slot 001b - 2 slots 010b - 4 slots 011b - 8 slots 100b - 16 slots 101b - Reserved
3 CC	Credit Control Indicates whether the credit control is enabled. When this field is 1, it indicates that the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero, when there is positive credit and no packet to transmit in channel 1. The credit accumulates even when no packet is waiting in channel 1 and another channel is transmitting. When this field becomes 0, it indicates that the accumulated credit parameter in the credit-based shaper algorithm logic sets to zero, when there is positive credit and no packet to transmit in channel 1. No credit accumulates when no packet is waiting in channel 1 and other channel is transmitting. 0b - Disabled 1b - Enabled
2 AVALG	AV Algorithm Indicates whether the CBS algorithm is enabled. If you program queue 1 for AV, this field configures the scheduling algorithm for this queue. When this field is 1, it indicates that the credit based shaper algorithm (CBS) is selected for queue 1 traffic. If this field becomes 0, strict priority is selected. 0b - Disabled 1b - Enabled
1-0 —	Reserved.

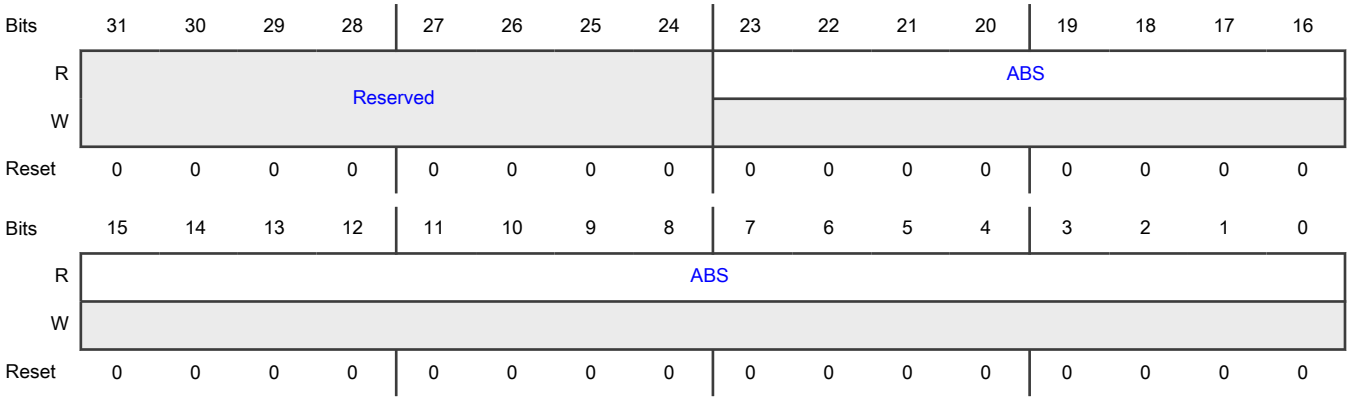
78.17.229 MTL Tx Queue 1 ETS Status (MTL_TxQ1_ETS_Status)

Offset

Register	Offset
MTL_TxQ1_ETS_Status	D54h

Function
Provides the average traffic transmitted in queue 1.

Diagram



Fields

Field	Function
31-24 —	Reserved.
23-0 ABS	Average Bits per Slot Contains the average transmitted bits per slot. Computes this field over number of slots programmed in the MTL_TxQ(#i)_ETS_CONTROL register's SLC field of, if you enables AV operation. This field's maximum value is 0x6_4000 in 100 Mbit/s, 0x3E_8000 in 1000 Mbit/s and 9C_4000 in 2500 Mbit/s mode respectively. Computes this field over every 10 million bit times slot (4 ms in 2500 Mbit/s; 10 ms in 1000 Mbit/s; 100 ms in 100 Mbit/s) when you enables DCB operation for queue. The maximum value is 0x989680.

78.17.230 MTL Tx Queue 1 Quantum Weight (MTL_TxQ1_Quantum_Weight)

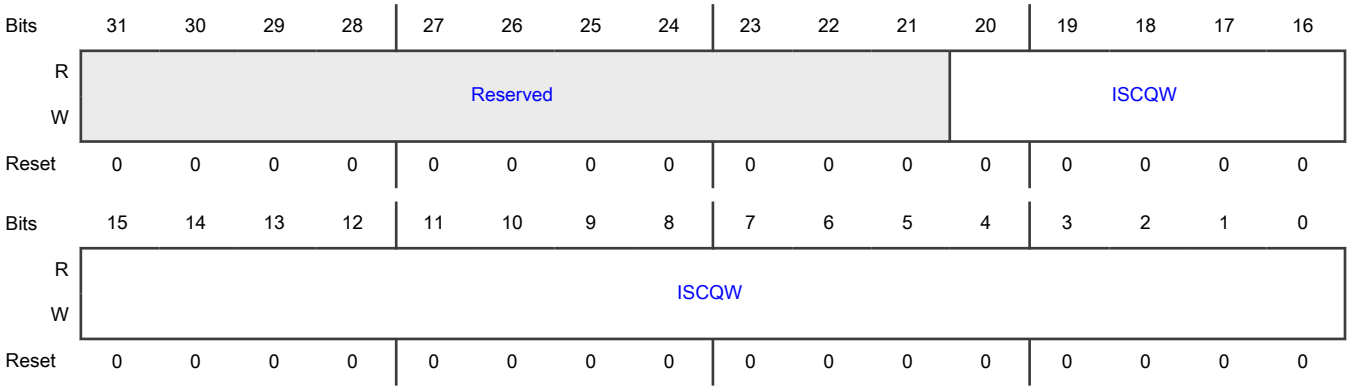
Offset

Register	Offset
MTL_TxQ1_Quantum_Weight	D58h

Function

Provides the average traffic transmitted in queue 1.

Diagram



Fields

Field	Function
31-21 —	Reserved.
20-0 ISCQW	idleSlopeCredit, Quantum or Weights idleSlopeCredit Contains the idleSlopeCredit value required for the credit-based shaper algorithm for queue 1, when you enables the AV feature. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbit/s; 8 ns for 1000 Mbit/s; 3.2 ns for 2500 Mbit/s) when the credit is increasing. You must program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbit/s mode and 0x1000 in 100 Mbit/s mode. Bits[20:14] must be written to zero. Quantum Contains the quantum value in bytes to be added to credit during every queue scanning cycle, when you enables the DCB operation with DWRR algorithm for queue 1 traffic. The maximum value is 0x1312D0 bytes. Weights Contains the weight for this queue, when you enables the DCB operation with WFQ algorithm for queue 1 traffic. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. Contains the weight for this queue, when you enables the DCB operation or generic queuing operation with WRR algorithm for queue 1 traffic. The maximum value is 0x64. Bits [20:7] must be written to zero.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE In multiple Queue configuration you must program this field in respective per queue register to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. You must not program this field when only Q0 is enabled. In general, you must program a non-zero value on both receive and transmit when WRR algorithm is selected. In receive, the register is MTL_Operation_Mode register. **NOTE** For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that transmit queue. The finish time is not a function of particular packet alone but it is according to the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) **NOTE** The programmed weights do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

78.17.231 MTL Tx Queue 1 Sendslope Credit (MTL_TxQ1_SendSlopeCredit)

Offset

Register	Offset
MTL_TxQ1_SendSlopeCredit	D5Ch

Function

Contains the sendSlope credit value required for the credit-based shaper algorithm for the queue.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved		SSC													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-14 —	Reserved.
13-0 SSC	sendSlopeCredit Value Contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1, when you enables the AV operation. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbit/s, 1000 Mbit/s and 2500 Mbit/s respectively) when the credit is decreasing. You must program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbit/s mode and 0x1000 in 100 Mbit/s mode. You must program this field with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when channel 1 is selected for transmission.

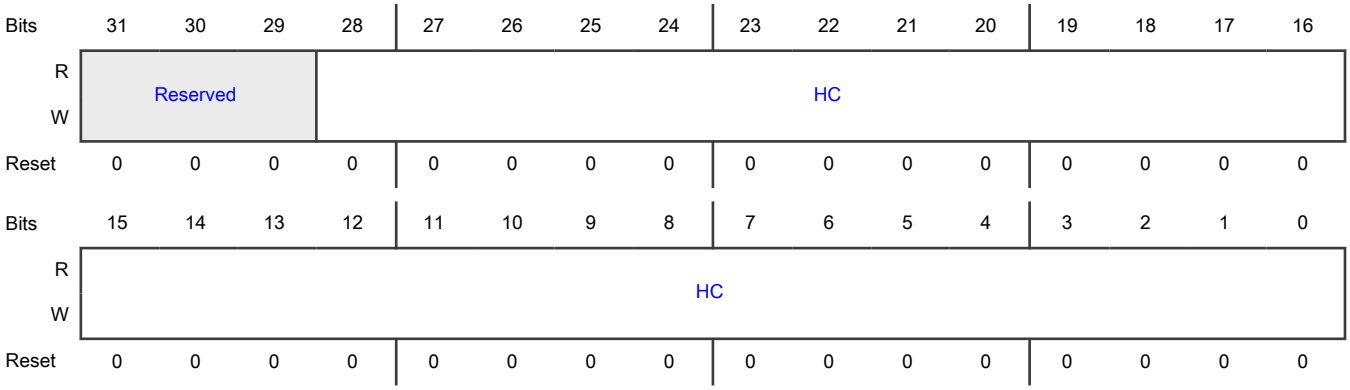
78.17.232 MTL Tx Queue 1 HiCredit (MTL_TxQ1_HiCredit)

Offset

Register	Offset
MTL_TxQ1_HiCredit	D60h

Function
Contains the hiCredit value required for the credit-based shaper algorithm for the queue.

Diagram



Fields

Field	Function
31-29 —	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
28-0 HC	hiCredit Value Contains the hiCredit value required for the credit-based shaper algorithm, when you enables the AV feature. This is the maximum value that you can accumulate in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The specified value is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

78.17.233 MTL Tx Queue 1 LoCredit (MTL_TxQ1_LoCredit)

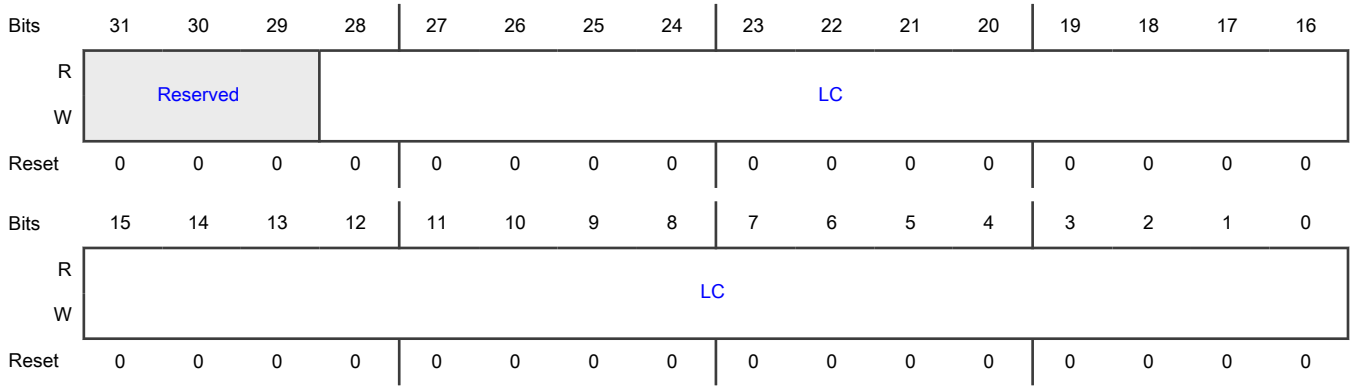
Offset

Register	Offset
MTL_TxQ1_LoCredit	D64h

Function

Contains the loCredit value required for the credit-based shaper algorithm for the queue.

Diagram



Fields

Field	Function
31-29 —	Reserved.
28-0 LC	loCredit Value Contains the loCredit value required for the credit-based shaper algorithm, when you enables the AV operation. This is the minimum value that you can accumulate in the credit parameter. This is specified in bits scaled by 1,024. The maximum value you can program corresponds to twice the maxFrameSize this queue transmits. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. The programmed value is 2's complement of the value, that is, 0x1800_0000 because it is a negative value.

78.17.234 MTL Queue 1 Interrupt Control Status (MTL_Q1_Interrupt_Control_Status)

Offset

Register	Offset
MTL_Q1_Interrupt_Control_Status	D6Ch

Function

Contains the interrupt enable and status bits for the queue 1 interrupts.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-25 —	Reserved.
24 RXOIE	Receive Queue Overflow Interrupt Enable Enables or disables the receive queue overflow interrupt. When this field is 1, it enables the receive queue overflow interrupt. When this field becomes 0, it disables the receive queue overflow interrupt. 0b - Disable 1b - Enable
23-17 —	Reserved.
16 RXOVFIS	Receive Queue Overflow Interrupt Status Indicates whether the status of receive queue overflow interrupt is detected. Indicates that the receive queue had an overflow when it receives the packet. If you transfers a partial packet to the application, the overflow status sets in RDES3[21]. This field is 0 when the application writes 1 to it.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
15-10 —	Reserved.
9 ABPSIE	Average Bits Per Slot Interrupt Enable Indicates whether an average bits per slot interrupt is enabled. When this field is 1, it indicates that the MAC asserts the sbd_intr_o or mci_intr_o interrupt when you update the average bits per slot status. When this field is 0, it indicates that the interrupt is not asserted for such an event. 0b - Disabled 1b - Enabled
8 TXUIE	Transmit Queue Underflow Interrupt Enable Enables or disables the transmit queue underflow interrupt. When this field is 1, it enables the transmit queue underflow interrupt. When this field becomes 0, it disables the transmit queue underflow interrupt. 0b - Disabled 1b - Enabled
7-2 —	Reserved.
1 ABPSIS	Average Bits Per Slot Interrupt Status Indicates whether the average bits per slot interrupt status is detected. When this field is 1, it indicates that the MAC has updated the ABS value. This field is 0 when the application writes 1 to it. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status Indicates whether the transmit queue underflow interrupt status is detected. Indicates that the transmit queue had an underflow when you transmits the packet. Suspends the transmission and sets an underflow error TDES3[2]. This field is 0 when the application writes 1 to this field.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected

78.17.235 MTL Rx Queue 1 Operation Mode (MTL_RxQ1_Operation_Mode)

Offset

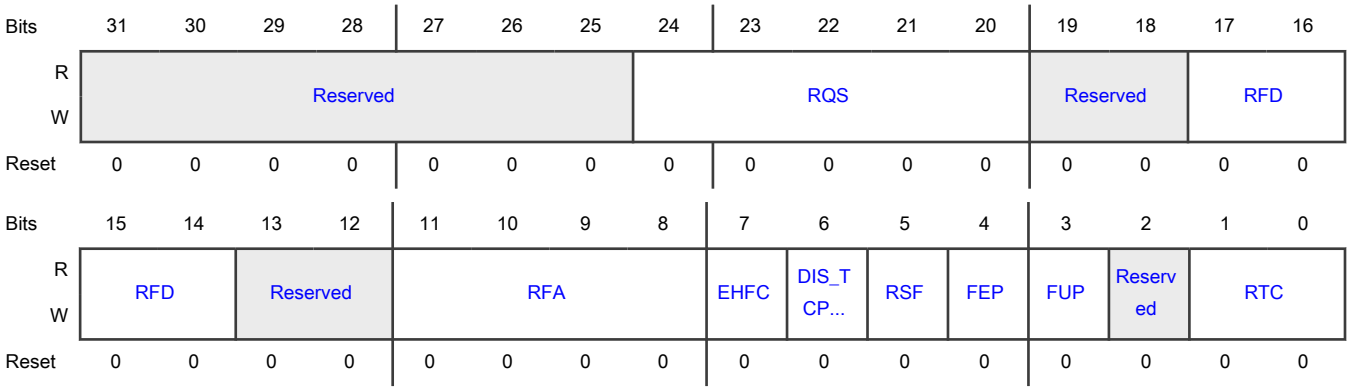
Register	Offset
MTL_RxQ1_Operation_Mode	D70h

Function

Establishes the receive queue operating modes and command.

The MTL_RxQ1_Operation_Mode[RFA] and MTL_RxQ1_Operation_Mode[RFD] are not backward compatible with the RFA and RFD fields of 4.00a release.

Diagram



Fields

Field	Function
31-25 —	Reserved.
24-20 RQS	Receive Queue Size Indicates the size of the allocated receive queues in blocks of 256 bytes. MTL_RxQ1_Operation_Mode[RQS] is read-write only if the number of receive queues is more than one, the

Table continues on the next page...

Table continued from the previous page...

Field	Function
	reset value is 0x0 and indicates 256 bytes size. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. You must program RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of receive queues is one, the field is read-only and the reset value reflects the configured RX FIFO size in blocks of 256 bytes. The field width depends on the receive memory size selected in your configuration. For example, if the memory size is 2048, the field width is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved.
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) Controls the threshold (fill-level of Rx queue) at which the flow control de-asserts after activation 0 - Full minus 1 KB, that is, FULL 1 KB 1 - Full minus 1.5 KB, that is, FULL 1.5 KB 2 - Full minus 2 KB, that is, FULL 2 KB 3 -Full minus 2.5 KB, that is, FULL 2.5 KB ... 14 - Full minus 8 KB, that is, FULL 8 KB 15 - Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only when flow control asserts. **NOTE** Program the value in such a way that the threshold is a positive number. When MTL_RxQ1_Operation_Mode[EHFC] = 1, these values are applicable only when the receive queue size which MTL_RxQ1_Operation_Mode[RQS] determines, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size which MTL_RxQ1_Operation_Mode[RQS] determines. The field width depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved.
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex Controls the threshold (fill-level of Rx queue) at which the flow control activates. See MTL_RxQ1_Operation_Mode[RFD], for more information on encoding for this field.

Table continues on the next page...

Table continued from the previous page...

Field	Function
7 EHFC	Enable Hardware Flow Control Enables or disables hardware flow control. If this field is 1, it enables the flow control signal operation, based on the receive queue's fill-level. When this field becomes 0, it disables the flow control operation. 0b - Disable 1b - Enable
6 DIS_TCP_EF	Disable Dropping of TCP or IP Checksum Error Packets Indicates whether the dropping of TCP or IP checksum error packets is enabled. When this field is 1, it indicates that the MAC does not drop the packets which only have the errors that the receive checksum offload engine detects. Such packets have errors only in the encapsulated payload. MAC receives an Ethernet packet in which there are no errors (including FCS error). When this field becomes 0, it indicates that all the error packets drop if MTL_RxQ1_Operation_Mode[FEP] resets. 0b - Enabled 1b - Disabled
5 RSF	Receive Queue Store and Forward Indicates whether the receive queue store and forward is enabled. When this field is 1, it indicates that the module reads a packet from the receive queue only after the complete packet is written to it and ignores MTL_RxQ1_Operation_Mode[RTC]. When this field becomes 0, it indicates that the receive queue operates in the Threshold (cut-through) mode, subject to the threshold which MTL_RxQ1_Operation_Mode[RTC] specifies. 0b - Disabled 1b - Enabled
4 FEP	Forward Error Packets Indicates whether the forward error packets are enabled. If this field becomes 0, it indicates that the receive queue drops the packets with an error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, the packet does not drops, if the start byte (write) pointer of a packet is already transferred to the read controller side in Threshold mode. When this field is 1, it indicates that all the packets except the runt error packets forward to the application or DMA. If MTL_RxQ1_Operation_Mode[RSF] is 1 and the receive queue overflows when a partial packet is written, the packet drops irrespective of the setting of this field. However, if MTL_RxQ1_Operation_Mode[RSF] resets and the receive queue overflows when a partial packet is written, you may forward a partial packet to the application or DMA. 0b - Disabled 1b - Enabled
3	Forward Undersized Good Packets

Table continues on the next page...

Table continued from the previous page...

Field	Function
FUP	Indicates whether the forward undersized good packets are enabled. When this field is 1, it indicates that the receive queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this field becomes 0, it indicates that the receive queue drops all the packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0b - Disabled 1b - Enabled
2 —	Reserved.
1-0 RTC	Receive Queue Threshold Control Controls the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL receive queue is larger than the threshold. Also, the full packets with length less than the threshold are automatically transferred. This field is valid only when MTL_RxQ1_Operation_Mode[RSF] = 0. This field is ignored when MTL_RxQ1_Operation_Mode[RSF] = 1. 00b - 64 01b - 32 10b - 96 11b - 128

78.17.236 MTL Rx Queue 1 Missed Packet Overflow Counter (MTL_RxQ1_Missed_Packet_Overflow_Cnt)

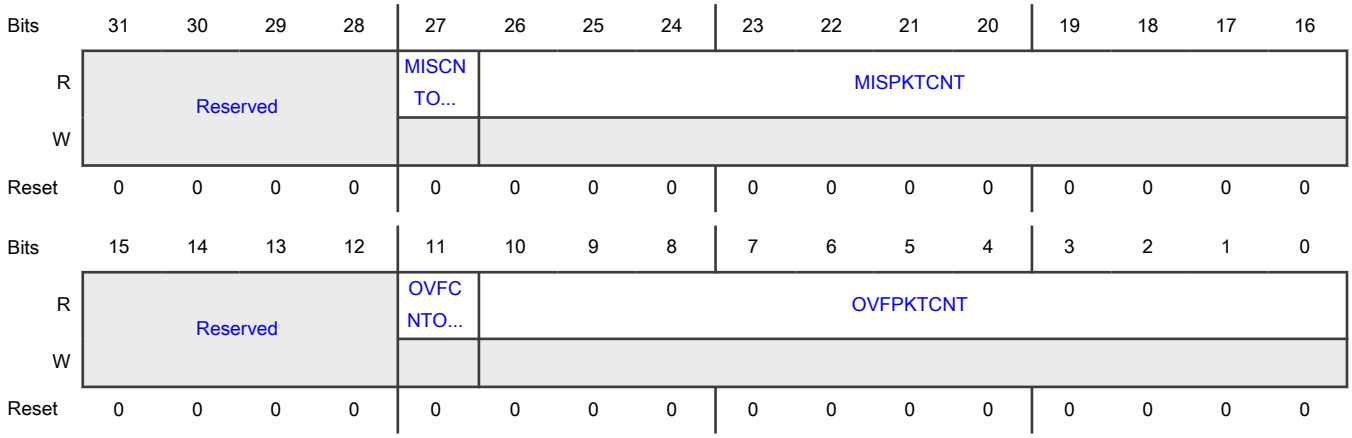
Offset

Register	Offset
MTL_RxQ1_Missed_Packet_Overflow_Cnt	D74h

Function

Contains the counter for packets missed because of receive queue packet flush and packets discarded because of receive queue overflow.

Diagram



Fields

Field	Function
31-28 —	Reserved.
27 MISCNTOVF	Missed Packet Counter Overflow Bit Indicates whether the missed packet counter overflow is detected. When this field is 1, it indicates that the receive queue missed packet counter has crossed the maximum limit. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
26-16 MISPKTCNT	Missed Packet Counter Indicates the number of packets the module has missed because the application asserted ari_pkt_flush_i[] for this queue. This counter resets when this register is read with mci_be_i[0] at 1b1. This counter increases by 1 when the DMA discards the packet because of buffer unavailability. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence.
15-12 —	Reserved.
11 OVFCNTOVF	Overflow Counter Overflow Bit Indicates whether the counter overflow status is detected. When this field is 1, it indicates that the receive queue overflow packet counter field has crossed the maximum limit.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not detected 1b - Detected
10-0 OVFPKTCNT	Overflow Packet Counter Indicates the number of packets which the module discards because of receive queue overflow. This counter increments each time the module discards an incoming packet because of overflow. It resets when this register is read with mci_be_i[0] at 1'b1. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence.

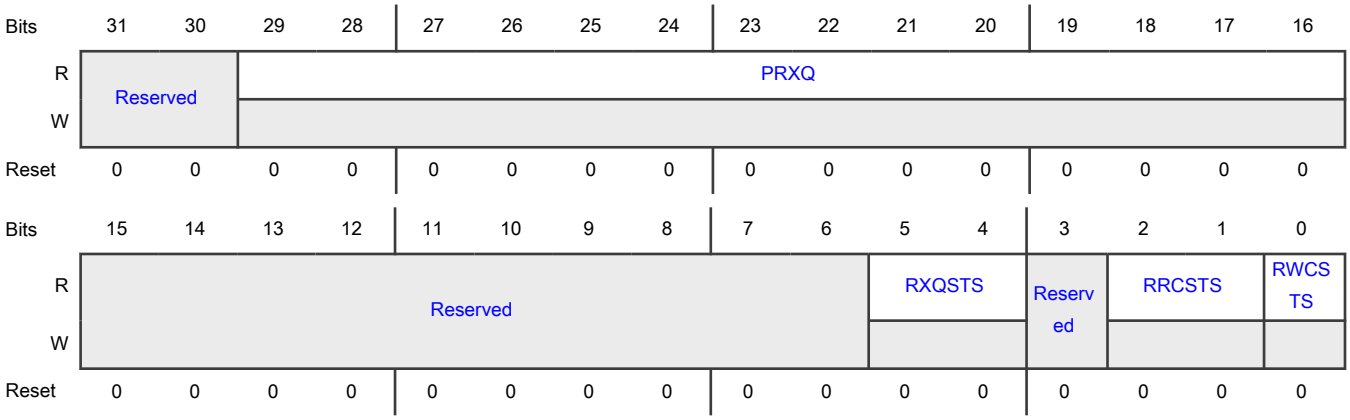
78.17.237 MTL Rx Queue 1 Debug (MTL_RxQ1_Debug)

Offset

Register	Offset
MTL_RxQ1_Debug	D78h

Function
Provides the debug status of various blocks related to the receive queue.

Diagram



Fields

Field	Function
31-30	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
29-16 PRXQ	Number of Packets in Receive Queue Indicates the current number of packets in the receive queue. The theoretical maximum field value is 256KB/16B = 16K packets, that is, Max_Queue_Size/Min_Packet_Size.
15-6 —	Reserved.
5-4 RXQSTS	MTL Rx Queue Fill-Level Status Provides the status of the receive queue fill-level. 00b - Rx Queue empty 01b - Rx Queue fill-level below flow-control deactivate threshold 10b - Rx Queue fill-level above flow-control activate threshold 11b - Rx Queue full
3 —	Reserved.
2-1 RRCSTS	MTL Rx Queue Read Controller State Provides the state of the receive queue read controller. 00b - Idle state 01b - Reading packet data 10b - Reading packet status (or timestamp) 11b - Flushing the packet data and status
0 RWCSTS	MTL Rx Queue Write Controller Active Status Indicates whether the MTL receive queue write controller active status is detected. When this field is 1, it indicates that the MTL receive queue write controller is active, and it is transferring a received packet to the receive queue. 0b - Not detected 1b - Detected

78.17.238 MTL Rx Queue 1 Control (MTL_RxQ1_Control)

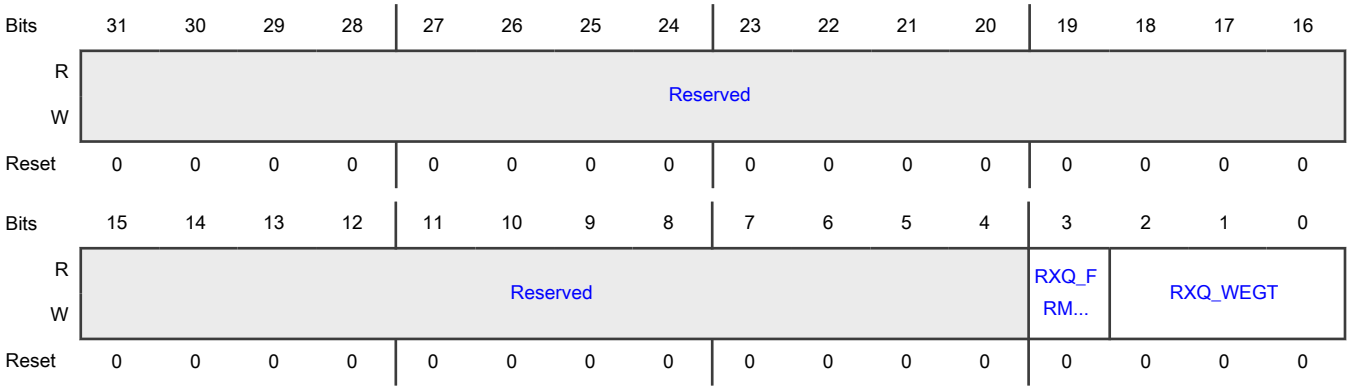
Offset

Register	Offset
MTL_RxQ1_Control	D7Ch

Function

Controls the receive arbitration and passing of received packets to the application.

Diagram



Fields

Field	Function
31-4 —	Reserved.
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration Indicates whether the receive queue packet arbitration is enabled. When this field is 1, it indicates that the module drives the packet data to the ARI interface such that the entire packet data of currently-selected queue transmits before switching to other queue. When this field becomes 0, it indicates that the module drives the packet data to the ARI interface such that the following amount of data of currently-selected queue transmits before switching to other queue: • PBL amount of data (indicated by ari_qN_pbl_i[]), or • Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the module drives the complete status (including timestamp status) during the packet's first PBL request (in store-and-forward mode) or the last PBL request (in Threshold mode). 0b - Disabled 1b - Enabled
2-0 RXQ_WEGT	Receive Queue Weight Indicates the weight assigned to the receive queue 0. Program this field with one value less than the required weight, that is reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

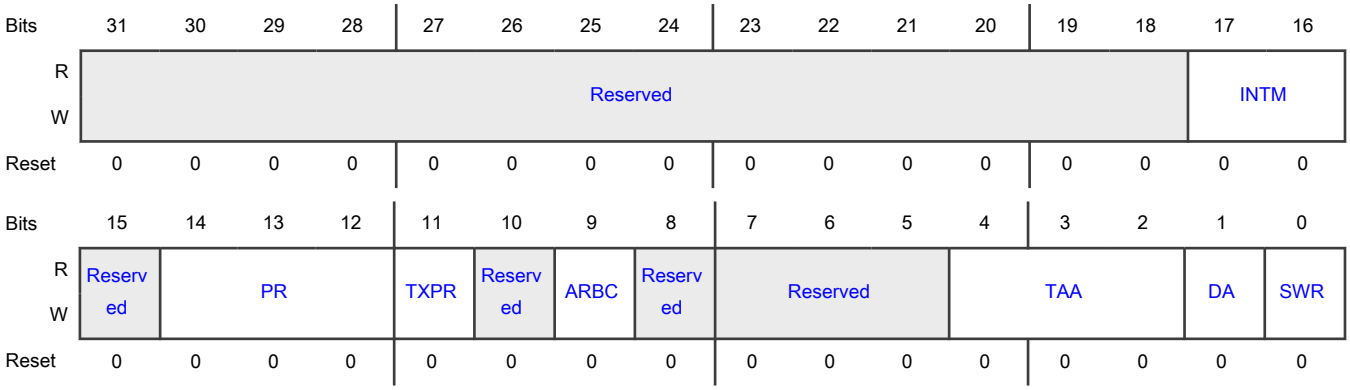
78.17.239 DMA Mode (DMA_Mode)

Offset

Register	Offset
DMA_Mode	1000h

Function
Establishes the bus operating modes for the DMA.

Diagram



Fields

Field	Function
31-18 —	Reserved.
17-16 INTM	Interrupt Mode Defines the interrupt mode of module. The behavior of the following outputs changes depending on these settings: sbd_perch_tx_intr_o[] (Transmit per channel interrupt) sbd_perch_rx_intr_o[] (Receive per channel interrupt) sbd_intr_o (Common interrupt) It also changes the behavior of the RI/TI bits in DMA_CH0_Status. 00 - sbd_perch_* are pulse signals for each TX/RX packet transfer completion events (irrespective of whether corresponding interrupts are enabled) for which IOC bits are enabled in descriptor. sbd_intr_o is also asserted when corresponding interrupts are enabled and cleared only when software clears the corresponding RI/TI status bits. 01 - sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	10 - sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. However, the signal is asserted again if the same event occurred again before it was cleared. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. 11 - Reserved See table "Transfer Complete Interrupt Behavior" for more information. 00b - See above description 01b - See above description 10b - See above description 11b - Reserved
15 —	Reserved.
14-12 PR	Priority Ratio Controls the priority ratio in weighted round-robin arbitration between the Rx DMA and Tx DMA. These fields are valid only when DMA_Mode[DA] resets. The priority ratio is Rx:Tx or Tx:Rx depending on whether DMA_Mode[TXPR] = 1 or it resets. 000b - The priority ratio is 1:1 001b - The priority ratio is 2:1 010b - The priority ratio is 3:1 011b - The priority ratio is 4:1 100b - The priority ratio is 5:1 101b - The priority ratio is 6:1 110b - The priority ratio is 7:1 111b - The priority ratio is 8:1
11 TXPR	Transmit Priority Indicates whether the transmit priority is enabled. When this field is 1, it indicates that the Tx DMA has higher priority than the Rx DMA during arbitration for the system-side bus. 0b - Disabled 1b - Enabled
10 —	Reserved.
9 ARBC	Is reserved for NXP internal use. This field must always be 0 unless instructed by NXP. Writing 1 to this field may cause unexpected behavior.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - NXP reserved field disabled 1b - NXP reserved field enabled up on NXP request
8 —	Reserved.
7-5 —	Reserved.
4-2 TAA	Transmit Arbitration Algorithm Selects the arbitration algorithm for the transmit side when you select multiple transit DMAs. 000b - Fixed priority (Channel 0 has the lowest priority and the last channel has the highest priority) 001b - Weighted Strict Priority (WSP) 010b - Weighted Round-Robin (WRR) 011b - Reserved (for 3'b011 to 3'b111)
1 DA	DMA Tx or Rx Arbitration Scheme Specifies the arbitration scheme between the transmit and receive paths of all channels. 0 - Weighted round-robin with Rx:Tx or Tx:Rx The priority between the paths is according to the priority specified in bits[14:12] and the priority weight is specified in DMA_Mode[TXPR]. 1 - Fixed Priority The transit path has priority over the receive path when DMA_Mode[TXPR] = 1. Otherwise, the receive path has priority over the transit path. 0b - Weighted Round-Robin with Rx:Tx or Tx:Rx 1b - Fixed Priority
0 SWR	Software Reset Indicates whether the software reset is enabled. When this field is 1, it indicates that the MAC and the DMA controller resets the logic and all internal registers of the DMA, MTL, and MAC. This field automatically clears after the reset operation completes in all module clock domains. A value of zero should be read in this field before reprogramming any module register. When this field is 1, it indicates that this field must read at least 4 CSR clock cycles. **NOTE** The reset operation completes only when all resets in all active clock domains de-assert. Therefore, to complete software reset, it is essential that all PHY input clocks (applicable for the selected PHY interface) are present. The time to complete the software reset operation depends on the frequency of the slowest active clock.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It clears automatically. Writing 1 sets this field and writing 0 has no effect. 0b - Disabled 1b - Enabled

78.17.240 DMA System Bus Mode (DMA_SysBus_Mode)

Offset

Register	Offset
DMA_SysBus_Mode	1004h

Function

Controls the behavior of the AHB or AXI master. It mainly controls burst splitting and the number of outstanding requests.

Diagram

—	
0 AXWHSTS	AHB Master Status Indicates whether the AXI master write channel or AHB master status is detected. When this field is 1, it indicates that the AHB master FSMs are in the non-idle state. 0b - Not detected 1b - detected

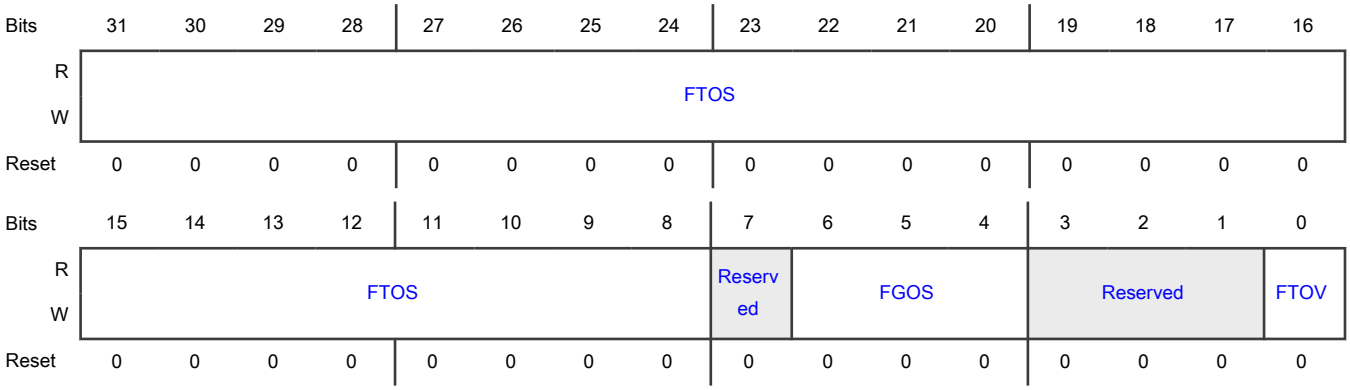
78.17.243 DMA TBS Control (DMA_TBS_CTRL)

Offset

Register	Offset
DMA_TBS_CTRL	1050h

Function
Controls the TBS attributes.

Diagram



Fields

Field	Function
31-8 FTOS	Fetch Time Offset Deduct the value in units of 256 nanoseconds, from the launch time to compute the fetch Time. Max value: 999,999,999 nanosecond, must be smaller than CTR-1 value when ESTM mode = 1, because this value is a modulo CTR value.
7	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
6-4 FGOS	Fetch GSN Offset Deduct the number GSN slots from the launch GSN to compute the fetch GSN. The value is valid only when DMA_TBS_CTRL[FTOV] = 1.
3-1 —	Reserved.
0 FTOV	Fetch Time Offset Valid Indicates whether the fetch time offset is valid. When this field is 1, it indicates that DMA_TBS_CTRL[FTOS] is valid. When this field is not 1, it indicates that the fetch offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0b - Invalid 1b - Valid

78.17.244 DMA Safety Interrupt Status (DMA_Safety_Interrupt_Status)

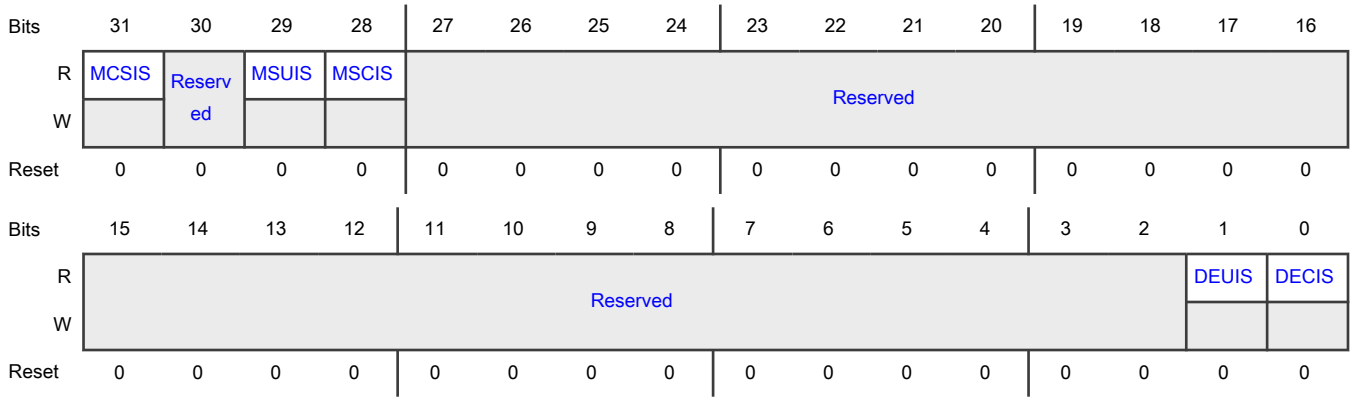
Offset

Register	Offset
DMA_Safety_Interrupt_Status	1080h

Function

Indicates summary (whether error occurred in DMA/MTL/MAC and correctable/uncorrectable) of the automotive safety related error interrupts.

Diagram



Fields

Field	Function
31 MCSIS	MAC Safety Uncorrectable Interrupt Status Indicates whether the MAC safety uncorrectable interrupt status is detected. Indicates that an uncorrectable safety related interrupt is 1 in the MAC module. When this field is 1, it indicates that you must read the MAC_DPP_FSM_Interrupt_Status, to get the cause of the safety interrupt in MAC. 0b - Not detected 1b - Detected
30 —	Reserved.
29 MSUIS	MTL Safety Uncorrectable Error Interrupt Status Indicates whether the MTL safety uncorrectable error interrupt status is detected. Indicates an uncorrectable error interrupt event in MTL. To get exact cause of the interrupt you must read the MTL_Safety_Interrupt_Status. 0b - Not detected 1b - Detected
28 MSCIS	MTL Safety Correctable Error Interrupt Status Indicates whether the MTL safety correctable error interrupt status is detected. Indicates a correctable error interrupt event in MTL. To get the exact cause of the interrupt you must read the MTL_Safety_Interrupt_Status. 0b - Not detected 1b - Detected
27-2 —	Reserved.
1 DEUIS	DMA ECC Uncorrectable Error Interrupt Status Indicates whether the DMA ECC uncorrectable error interrupt status is deducted. Indicates an interrupt event in the DMA ECC safety feature. To get the exact cause of the interrupt the application must read the DMA_ECC_Interrupt_Status register. 0b - Not detected 1b - Detected
0 DECIS	DMA ECC Correctable Error Interrupt Status Indicates whether the DMA ECC correctable error interrupt status is detected. Indicates an interrupt event in the DMA ECC safety feature. To get the exact cause of the interrupt the application must read the DMA_ECC_Interrupt_Status register.

Table continues on the next page...

Field	Function
31-25 —	Reserved.
24 —	Reserved.
23-21 —	Reserved.
20-18	Descriptor Skip Length

Table continues on the next page...

Table continued from the previous page...

Field	Function
DSL	Specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. The DMA assumes the descriptor table as contiguous, when the DSL value is equal to zero.
17 —	Reserved.
16 PBLx8	8xPBL mode Indicates whether 8xPBL mode is enabled. When this field is 1, it indicates that the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0b - Disabled 1b - Enabled
15-14 —	Reserved.
13-0 —	Reserved.

78.17.246 DMA Channel Tx Control (DMA_CH0_Tx_Control)

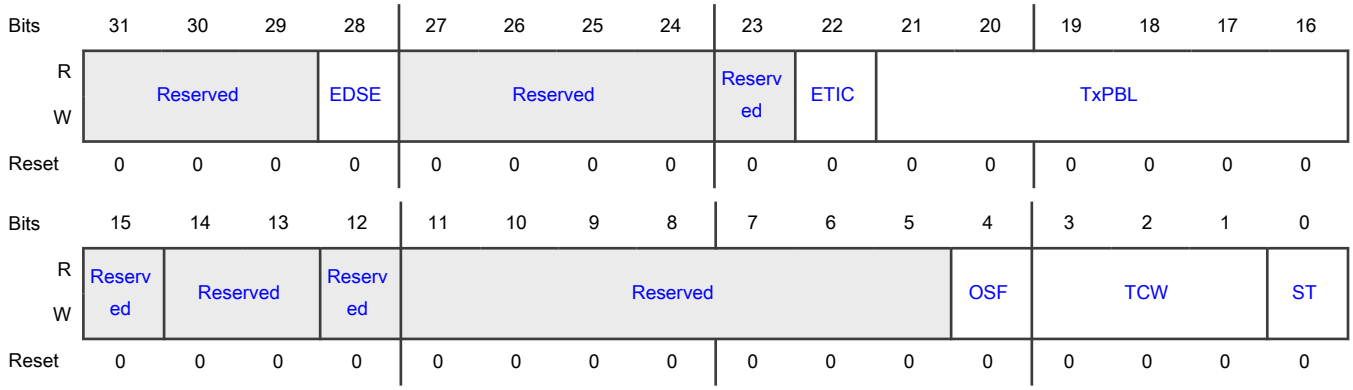
Offset

Register	Offset
DMA_CH0_Tx_Control	1104h

Function

Controls the transmit features such as PBL, TCP segmentation, and transmit channel weights.

Diagram



Fields

Field	Function
31-29 —	Reserved.
28 EDSE	Enhanced Descriptor Enable Indicates whether an enhanced descriptor is enabled. When this field is 1, it indicates that the corresponding channel uses 32 bytes enhanced descriptors for both normal and context descriptors. When this field becomes 0, it indicates that the corresponding channel uses the 16 bytes descriptors. 0b - Disabled 1b - Enabled
27-24 —	Reserved.
23 —	Reserved.
22 ETIC	Early Transmit Interrupt Control Indicates whether an early transmit interrupt is enabled. When this field is 1, it indicates that an early transmit interrupt (ETI) status = 1 after the data transfer from buffers of a transmit descriptor completes in which IOC bit (TDES2[31]) = 1. When this field becomes 1, it indicates that ETI = 1 only after a complete packet transfers to the MTL TX FIFO memory. 0b - Disabled 1b - Enabled
21-16 TxPBL	Transmit Programmable Burst Length

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Indicates the maximum number of beats to transfer in one DMA block data transfer. DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of these values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. Perform these steps to transfer more than 32 beats: 1. Set DMA_CH0_Control[PBLx8]. 2. Set the TxPBL. **NOTE** The maximum value of TxPBL must be less than or equal to half the transit queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the transit queue has space to store at least another TxPBL worth of data while the MTL Tx queue controller transfers data to MAC. For example, in 64-bit data width configurations the total locations in transit queue of size 512 bytes is 64. You must program TxPBL and 8xPBL to less than or equal to 32.
15 —	Reserved.
14-13 —	Reserved.
12 —	Reserved.
11-5 —	Reserved.
4 OSF	Operate on Second Packet Indicates whether the operation on second packet is enabled. When this field is 1, it instructs DMA to process the second packet of the transmit data even before you receive the status for the first packet. 0b - Disabled 1b - Enabled
3-1 TCW	Transmit Channel Weight Indicates the weight assigned to the corresponding transmit channel. When reset completes, this field is 0 for all the channels by default, which results in equal weights to all channels.
0 ST	Start or Stop Transmission Command Indicates whether to start or stop the transmission command. When this field is 1, it indicates that the transmission is in the running state. DMA checks the transmit list at the current position for a packet to be transmitted.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	DMA tries to acquire descriptor from either of these positions: • The current position in the list. This is the base address of the transmit list to which DMA_CH0_TxDesc_List_Address sets. • The position at which the transmission was previously stopped. The transmission enters the suspended state and DMA_CH0_Status[TBU] = 1, if DMA does not own the current descriptor. The start transmission command is effective only when the transmission stops. If the command is issued before setting DMA_CH0_TxDesc_List_Address, you cannot predict the DMA behavior. When this field becomes 0, it indicates that the transmission process is placed in the stopped state when the transmission of the current packet completes . The next descriptor position in the transmit list is saved, and it becomes the current position when you restart the transmission. To change the list address, you must program DMA_CH0_TxDesc_List_Address with a new value when this field becomes 0.You can consider the new value when this field is 1 again. The stop transmission command is effective only when the transmission of the current packet completes or the transmission is in the suspended state. 0b - Stop 1b - Start

78.17.247 DMA Channel Rx Control (DMA_CH0_Rx_Control)

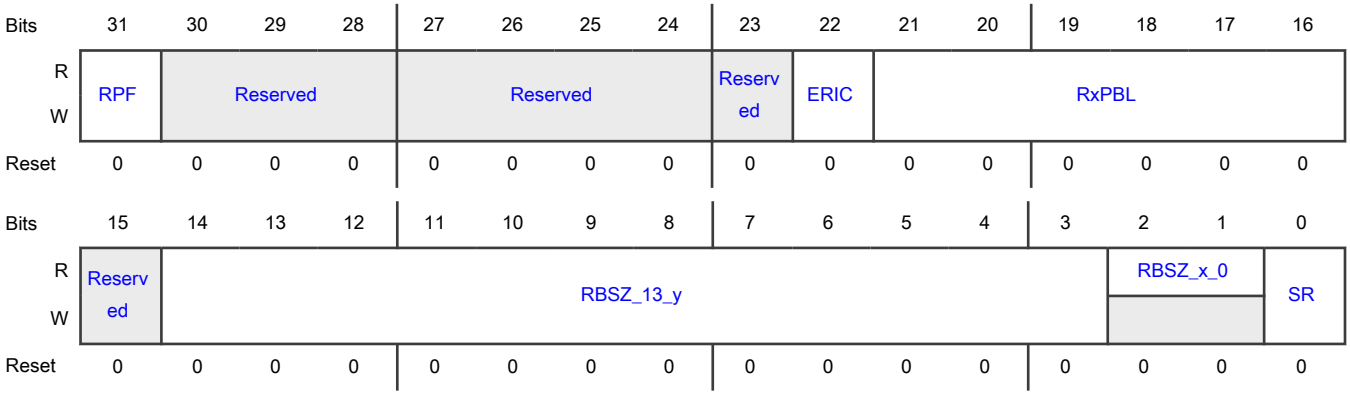
Offset

Register	Offset
DMA_CH0_Rx_Control	1108h

Function

Controls the receive features such as PBL, buffer size, and extended status.

Diagram



Fields

Field	Function
31 RPF	Rx Packet Flush Indicates whether the receive packet flush is enabled. When this field is 1, it indicates that the module automatically flushes the packet from the receive queues destined to this DMA receive channel, when it stops. When this field remains 1 and the software driver re-starts DMA, the packets residing in the receive queues that were received when this RxDMA stops and flushes out. The packets that MAC receives after the RxDMA re-starts, route to the RxDMA. The flushing takes place on the read side of the receive queue. When this field is 0, it indicates that the module do not flush the packet in the receive queue destined to this RxDMA channel when it is in STOP state. This may cause head-of-line blocking in the corresponding receive queue. **NOTE** The packet flow from a receive DMA channel to the application by writing 1 to this field stops, only when there is one-to-one mapping of receive queue to receive DMA channels. In Dynamic mapping mode, writing 1 to this field in any DMA_CH(#i)_Rx_Control register might flush packets from an unintended receive queues which are destined to the stopped receive DMA channel. 0b - Disabled 1b - Enabled
30-28 —	Reserved.
27-24 —	Reserved.
23 —	Reserved.
22 ERIC	Early Receive Interrupt Control Indicates whether an early receive interrupt is enabled. When this field is 1, it indicates that the early receive interrupt (ERI) status sets after every burst transfer of data from the Rx DMA to the buffer completes. When this field becomes 0, it indicates that ERI sets only after a complete buffer is filled by the RxDMA. 0b - Disabled 1b - Enabled
21-16 RxPBL	Receive Programmable Burst Length Indicates the maximum number of beats to be transferred in one DMA block data transfer. DMA always attempts max burst as specified in PBL every time it starts a burst transfer on the application bus. You can program PBL with any of these values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1. Set DMA_CH0_Control[PBLx8]. 2. Set the RxPBL. **NOTE** The maximum value of RxPBL must be less than or equal to half the receive queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the receive queue has space to store at least another Rx PBL worth of data while the receive DMA transfers a block of data. For example, in 64-bit data width configurations the total locations in receive queue of size 512 bytes is 64. You must program RxPBL and 8xPBL to less than or equal to 32.
15 —	Reserved.
14-3 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] splits into two fields, higher field is RBSZ_13_y and lower field is RBSZ_x_0. RBSZ[13:0] field indicates the receive buffers size specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. **NOTE** The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the buffer address pointer value is not aligned with data bus width. Hence the lower RBSZ_x_0 fields are read-only and the value is considered as all-zero. Thus RBSZ_13_y field indicates the buffer size in terms of locations (with the width same as bus-width).
2-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] splits into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. The field width is of 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive Indicates whether to start or stop receive. When this field is 1, it indicates that the DMA tries to acquire the descriptor from the receive list and processes the incoming packets. DMA tries to acquire descriptor from either of these positions: • The current position in the list. This is the address which DMA_CH0_RxDesc_List_Address sets. • The position at which the receive process was previously stopped. If DMA does not own the current descriptor, the reception is suspended and DMA_CH0_Status[RBU] = 1. The start receive command is effective only when the reception stops. If the command is issued before setting DMA_CH0_RxDesc_List_Address, the DMA behavior is unpredictable.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field becomes 0, it indicates that the receive DMA operation stops after the transfer of the current packet. The next descriptor position in the receive list is saved, and it becomes the current position after the receive process restarts. The stop receive command is effective only when the receive process is in the running (waiting for receive packet) or suspended state. 0b - Stop 1b - Start

78.17.248 DMA Channel 0 Tx Descriptor List Address (DMA_CH0_TxDesc_List_Address)

Offset

Register	Offset
DMA_CH0_TxDesc_List_Address	1114h

Function

Specifies DMA to the start of transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). DMA internally converts it to bus width aligned address by making the corresponding LSB low.

You can write to this register only when the transit DMA stops, that is, DMA_CH0_Tx_Control[ST] = 0. When stopped, write this register with a new descriptor list address. When DMA_CH0_Tx_Control[ST] = 1, DMA uses the newly-programmed descriptor base address. If this register does not change when DMA_CH0_Tx_Control[ST] = 0, DMA uses the descriptor address where it was stopped earlier.

Diagram

Fields

Field	Function
31-2	Start of Transmit List

Table continues on the next page...

Table continued from the previous page...

Field	Function
TDESLA	Contains the base address of the first descriptor in the transmit descriptor list. DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The field width depends on the configuration: 31:2 for 32-bit configuration 31:3 for 64-bit configuration 31:4 for 128-bit configuration
1-0 —	Reserved.

78.17.249 DMA Channel 0 Rx Descriptor List Address (DMA_CH0_RxDesc_List_Address)

Offset

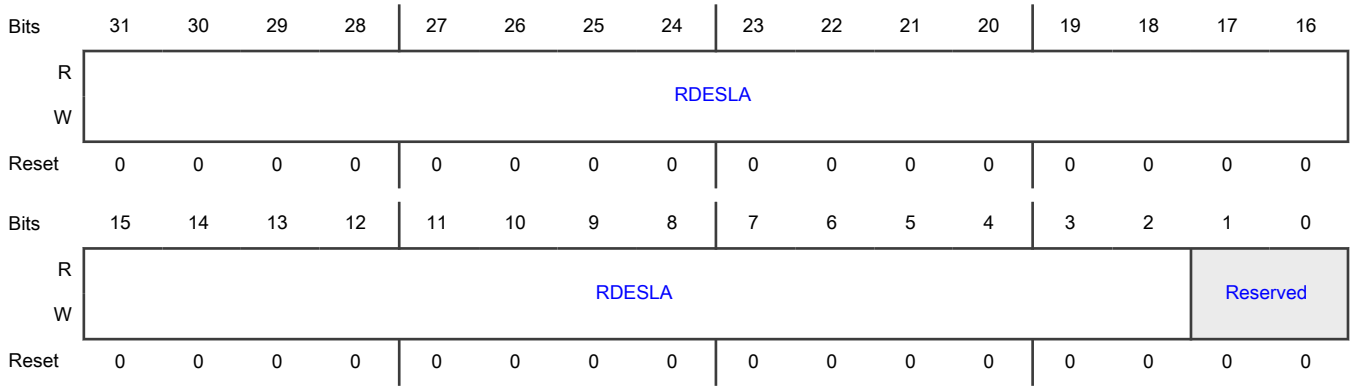
Register	Offset
DMA_CH0_RxDesc_List_Address	111Ch

Function

Specifies DMA to the start of receive descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). DMA internally converts it to bus width aligned address by making the corresponding LS bits low. You can write to this register only when reception stops. When stopped, write this register before the receive start command is given. You can write to this register only when Rx DMA stops, that is, DMA_CH0_Rx_Control[SR] = 0. When stopped, write this register with a new descriptor list address.

When DMA_CH0_Rx_Control[SR] = 1, it indicates that DMA takes the newly programmed descriptor base address.

Diagram



Fields

Field	Function
31-2 RDESLA	Start of Receive List Contains the base address of the first descriptor in the receive descriptor list. DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The field width depends on the configuration: 31:2 for 32-bit configuration 31:3 for 64-bit configuration 31:4 for 128-bit configuration
1-0 —	Reserved.

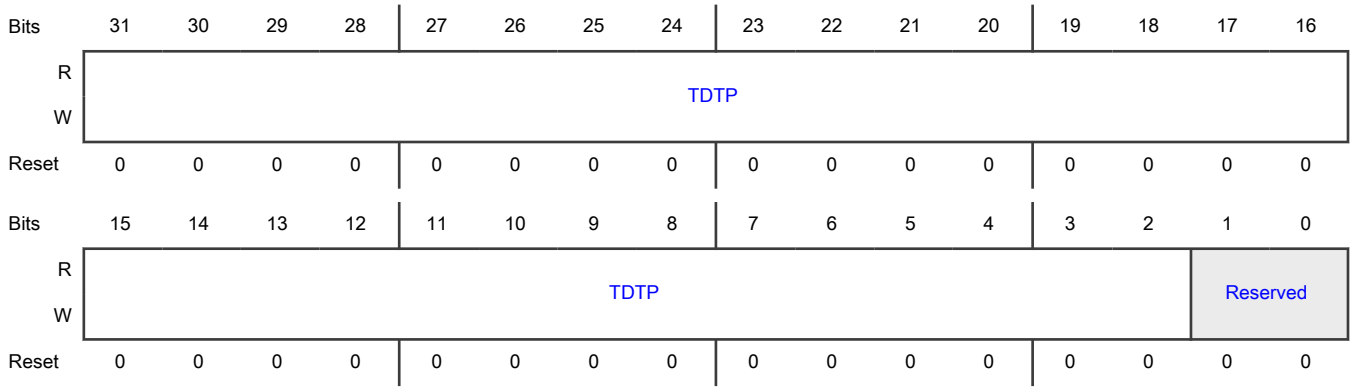
78.17.250 DMA Channel 0 Tx Descriptor Tail Pointer (DMA_CH0_TxDesc_Tail_Pointer)

Offset

Register	Offset
DMA_CH0_TxDesc_Tail_Pointer	1120h

Function
Points to an offset from the base and indicates the location of the last valid descriptor.

Diagram



Fields

Field	Function
31-2	Transmit Descriptor Tail Pointer

Table continues on the next page...

Table continued from the previous page...

Field	Function
TDTP	Contains the tail pointer for the transit descriptor ring. You must write the tail pointer to add more descriptors to the transit channel. The hardware tries to transmit all packets to the descriptors referenced between the head and the tail pointer registers. The field width depends on the configuration: 31:2 for 32-bit configuration 31:3 for 64-bit configuration 31:4 for 128-bit configuration
1-0 —	Reserved.

78.17.251 DMA Channel 0 Rx Descriptor List Pointer (DMA_CH0_RxDesc_Tail_Pointer)

Offset

Register	Offset
DMA_CH0_RxDesc_Tail_Pointer	1128h

Function
Specifies an offset from the base and indicates the location of the last valid descriptor.

Fields

Field	Function
31-10 —	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
9-0 TDRL	Transmit Descriptor Ring Length Sets the maximum number of transmit descriptors in the circular descriptor ring. The maximum number of descriptors are limited to 1K descriptors. NXP recommends a minimum ring descriptor length of 4. For example, you can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. Program this field to a value of 0x9, if you want to have 10 descriptors.

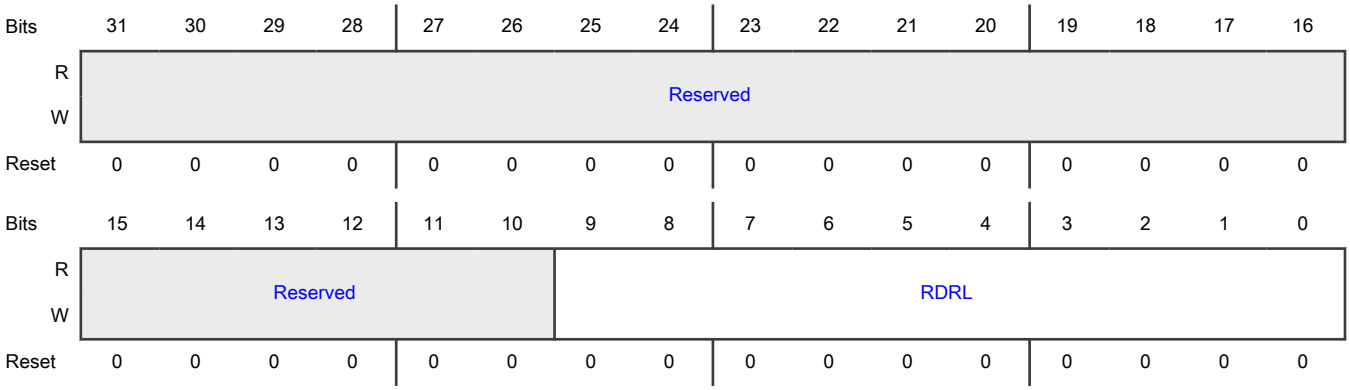
78.17.253 DMA Channel 0 Rx Descriptor Ring Length (DMA_CH0_RxDesc_Ring_Length)

Offset

Register	Offset
DMA_CH0_RxDesc_Ring_Length	1130h

Function
Contains the length of the receive descriptor circular ring.

Diagram



Fields

Field	Function
31-10 —	Reserved.
9-0 RDRL	Receive Descriptor Ring Length Sets the maximum number of receive descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, you can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. Program this field to a value of 0x9, if you want to have 10 descriptors.

78.17.254 DMA Channel 0 Interrupt Enable (DMA_CH0_Interrupt_Enable)

Offset

Register	Offset
DMA_CH0_Interrupt_Enable	1134h

Function
Enables the interrupts which the status register report.

Field	Function
31-16 —	Reserved.
15 NIE	Normal Interrupt Summary Enable Enables or disables the normal interrupt summary. When this field is 1, it enables the normal interrupt summary. This field also enables the following interrupts in DMA_CH0_Status: -Bit 0 - Transmit interrupt Bit 2 - Transmit buffer unavailable Bit 6 - Receive interrupt Bit 11 - Early receive interrupt When this field becomes 0, it disables the normal interrupt summary. 0b - Disable 1b - Enable
14	Abnormal Interrupt Summary Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
AIE	Enables or disables the abnormal interrupt summary. When this field is 1, it enables the abnormal interrupt summary. This field also enables the following interrupts in DMA_CH0_Status: Bit 1 - Transmit process stopped Bit 7 - Rx buffer unavailable Bit 8 - Receive process stopped Bit 9 - Receive watchdog timeout Bit 10 - Early transmit interrupt Bit 12 - Fatal bus error Bit 13 - Context descriptor error When this field becomes 0, it disables the abnormal interrupt summary. 0b - Disable 1b - Enable
13 CDEE	Context Descriptor Error Enable Enables or disables the context descriptor error. When this field is 1 along with DMA_CH0_Interrupt_Enable[AIE], it enables the descriptor error interrupt. When this field becomes 0, it disables the descriptor error interrupt. 0b - Disable 1b - Enable
12 FBEE	Fatal Bus Error Enable Enables or disables the fatal bus error. When this field is 1 along with DMA_CH0_Interrupt_Enable[AIE], it enables the fatal bus error interrupt. When this field becomes 0, it disables the fatal bus error interrupt. 0b - Disable 1b - Enable
11 ERIE	Early Receive Interrupt Enable Enables or disables the early receive interrupt. When this field is 1 along with DMA_CH0_Interrupt_Enable[NIE], it enables the early receive interrupt. When this field becomes 0, it disables the early receive interrupt. 0b - Disable 1b - Enable
10 ETIE	Early Transmit Interrupt Enable Enables or disables the early transmit interrupt.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field is 1 along with DMA_CH0_Interrupt_Enable[AIE], it enables the early transmit interrupt. When this field becomes 0, it disables the early transmit interrupt. 0b - Disable 1b - Enable
9 RWTE	Receive Watchdog Timeout Enable Enables or disables the receive watchdog timeout. When this field is 1 along with DMA_CH0_Interrupt_Enable[AIE], it enables the receive watchdog timeout interrupt. When this field becomes 0, it disables the receive watchdog timeout interrupt. 0b - Disable 1b - Enable
8 RSE	Receive Stopped Enable Enables or disables the receive stopped interrupt. When this field is 1 along with DMA_CH0_Interrupt_Enable[AIE], it enables the receive stopped interrupt. When this field becomes 0, it disables the receive stopped interrupt. 0b - Disable 1b - Enable
7 RBUE	Receive Buffer Unavailable Enable Enables or disables the receive buffer unavailable interrupt. When this field is 1 along with DMA_CH0_Interrupt_Enable[AIE], it enables the receive buffer unavailable interrupt. When this field becomes 0, it disables the receive buffer unavailable interrupt. 0b - Disable 1b - Enable
6 RIE	Receive Interrupt Enable Enables or disables the receive interrupt. When this field is 1 along with DMA_CH0_Interrupt_Enable[NIE], it enables the receive interrupt. When this field becomes 0, it disables the receive interrupt. 0b - Disable 1b - Enable
5-3 —	Reserved.
2 TBUE	Transmit Buffer Unavailable Enable Enables or disables the transmit buffer unavailable interrupt.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field is 1 along with DMA_CH0_Interrupt_Enable[NIE], it enables the transmit buffer unavailable interrupt. When this field becomes 0, it disables the transmit buffer unavailable interrupt. 0b - Disable 1b - Enable
1 TXSE	Transmit Stopped Enable Enables or disables the transmit stopped interrupt. When this field is 1 along with DMA_CH0_Interrupt_Enable[AIE], it enables the transmission stopped interrupt. When this field becomes 0, it disables the transmission stopped interrupt. 0b - Disable 1b - Enable
0 TIE	Transmit Interrupt Enable Enables or disables the transmit interrupt. When this field is 1 along with DMA_CH0_Interrupt_Enable[NIE], it enables the transmit interrupt. When this field becomes 0, it disables the transmit interrupt. 0b - Disable 1b - Enable

78.17.255 DMA Channel 0 Rx Interrupt Watchdog Timer (DMA_CH0_Rx_Interrupt_Watchdog_Timer)

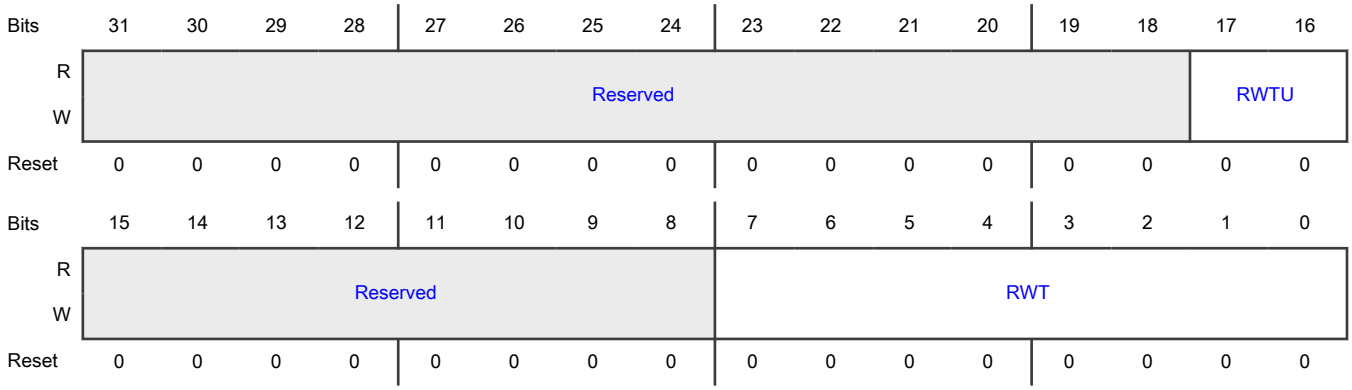
Offset

Register	Offset
DMA_CH0_Rx_Interrupt_Watchdog_Timer	1138h

Function

Indicates the watchdog timeout for receive interrupt (RI) from DMA. When you write this register with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Diagram



Fields

Field	Function
31-18 —	Reserved.
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units Indicates the system clock cycles number corresponding to one unit in DMA_CH0_Rx_Interrupt_Watchdog_Timer[RWT]. 2'b00 - 256 2'b01 - 512 2'b10 - 1024 2'b11 - 2048 For example, when DMA_CH0_Rx_Interrupt_Watchdog_Timer[RWT] = 2 and DMA_CH0_Rx_Interrupt_Watchdog_Timer[RWTU] = 1, the watchdog timer sets for 2*512=1024 system clock cycles.
15-8 —	Reserved.
7-0 RWT	Receive Interrupt Watchdog Timer Count Indicates the number of system clock cycles, multiplied by factor which DMA_CH0_Rx_Interrupt_Watchdog_Timer[RWTU] indicates, for which you set the watchdog timer. The watchdog timer triggers with the programmed value after the receive DMA completes the packet transfer for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of interrupt enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, it indicates that the RI bit is 1 and the timer stops. The watchdog timer resets when the RI bit is 1 because of automatic setting of RI per the interrupt enable bit RDES3[30] of any received packet.

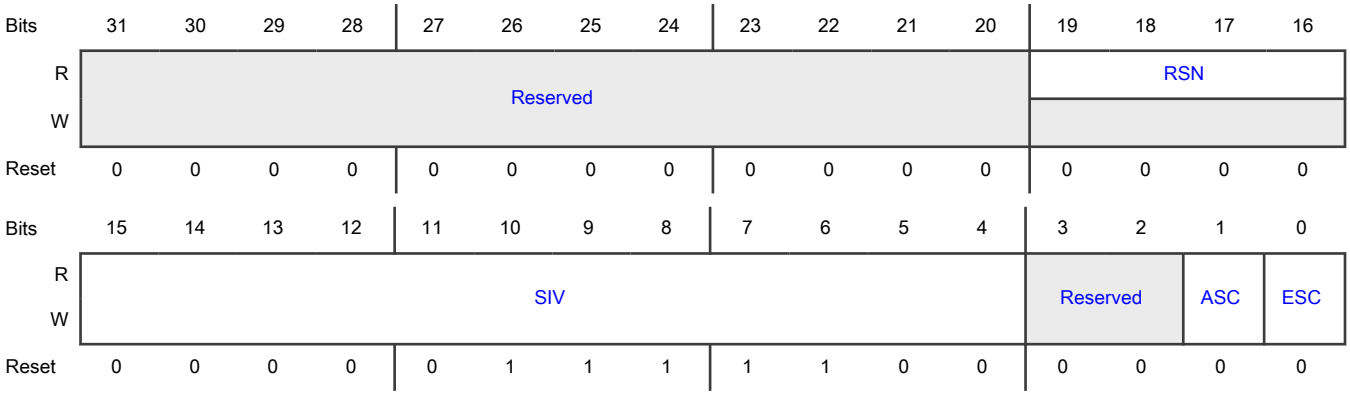
78.17.256 DMA Channel 0 Slot Function Control Status (DMA_CH0_Slot_Function_Control_Status)

Offset

Register	Offset
DMA_CH0_Slot_Function_Control_Status	113Ch

Function
Contains the control bits for slot function and the status for transmit path.

Diagram



Fields

Field	Function
31-20 —	Reserved.
19-16 RSN	Reference Slot Number Provides the current value of the reference slot number in DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value Controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096 us. The default or reset value is 0x07C which corresponds to slot interval of 125 us
3-2 —	Reserved.
1 ASC	Advance Slot Check Indicates whether the advance slot check is enabled. When this field is 1, it enables DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the transit descriptor is either:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Equal to the reference slot number given in DMA_CH0_Slot_Function_Control_Status[RSN], or Ahead of the reference slot number by up to two slots. This field is applicable only when DMA_CH0_Slot_Function_Control_Status[ESC] = 1. 0b - Disabled 1b - Enabled
0 ESC	Enable Slot Comparison Indicates whether the slot comparison is enabled. When this field is 1, it enables the checking of the slot numbers programmed in the transit descriptor with the current reference given in DMA_CH0_Slot_Function_Control_Status[RSN]. DMA fetches the data from the corresponding buffer only when the slot number is either: • Equal to the reference slot number, or • Ahead of the reference slot number by one slot. When this field becomes 0, it disables the checking of the slot numbers. DMA fetches the data immediately after you process the descriptor. **NOTE** You must not enable the UFO (UDP Fragmentation over IPv4)/TSO/USO along with TBS/AVB slot number check. The UFO/TSO/USO involves multiple packets/segments/ fragments transmission for single packet received from application and the slot number check are applicable for fetching only first segment/fragment. As a result it might be difficult for you to specify slot number for subsequent packets. 0b - Disabled 1b - Enabled

78.17.257 DMA Channel 0 Current Application Transmit Descriptor (DMA_CH0_Current_App_TxDesc)

Offset

Register	Offset
DMA_CH0_Current_App_TxDesc	1144h

Function
Specifies the current transmit descriptor which DMA reads.

Fields

Field	Function
31-0 CURRDESAPTR	Application Receive Descriptor Address Pointer Indicates that the DMA updates this pointer during the receive operation. This pointer clears when reset.

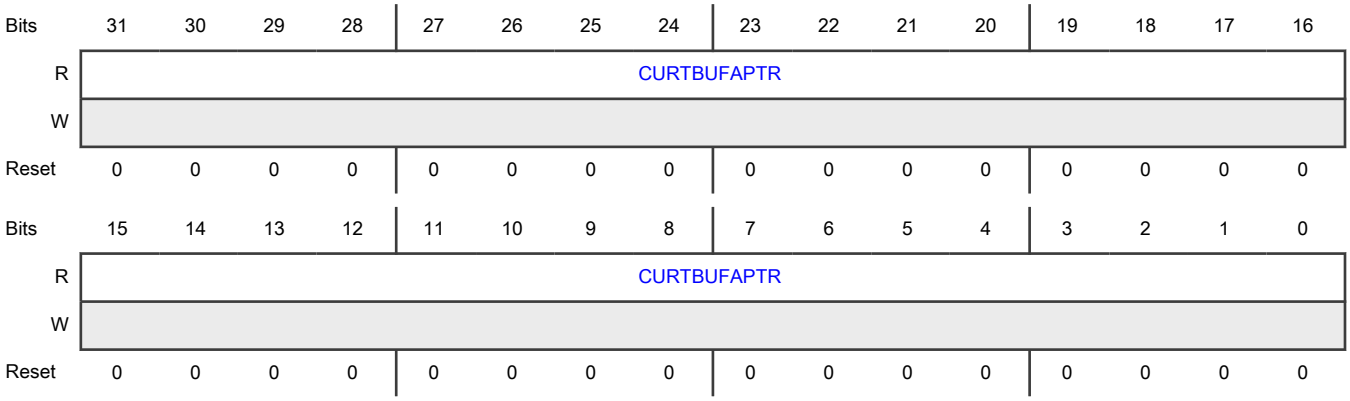
78.17.259 DMA Channel 0 Current Application Transmit Descriptor (DMA_CH0_Current_App_TxBuffer)

Offset

Register	Offset
DMA_CH0_Current_App_TxBuffer	1154h

Function
Specifies the current transit buffer address which DMA reads.

Diagram



Fields

Field	Function
31-0 CURTBUFAPTR	Application Transmit Buffer Address Pointer Indicates that DMA updates this pointer during the transit operation. This pointer clears when reset.

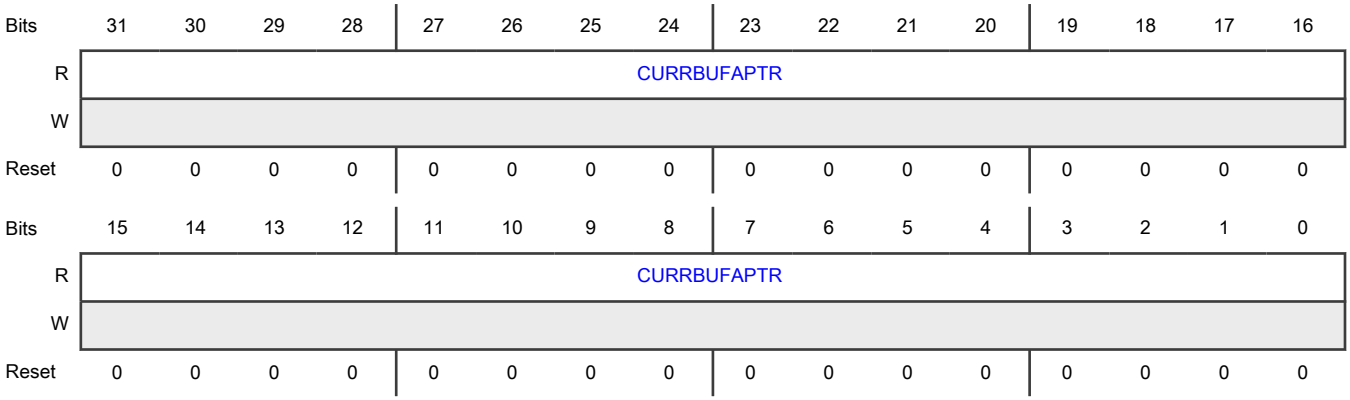
78.17.260 DMA Channel 0 Current Application Receive Buffer (DMA_CH0_Current_App_RxBuffer)

Offset

Register	Offset
DMA_CH0_Current_App_RxBuffer	115Ch

Function
Specifies the current receive buffer address which DMA read.

Diagram



Fields

Field	Function
31-0 CURRBUFAPTR	Application Receive Buffer Address Pointer Indicates that DMA updates this pointer during the receive operation. This pointer clears when reset.

78.17.261 DMA Channel 0 Status (DMA_CH0_Status)

Offset

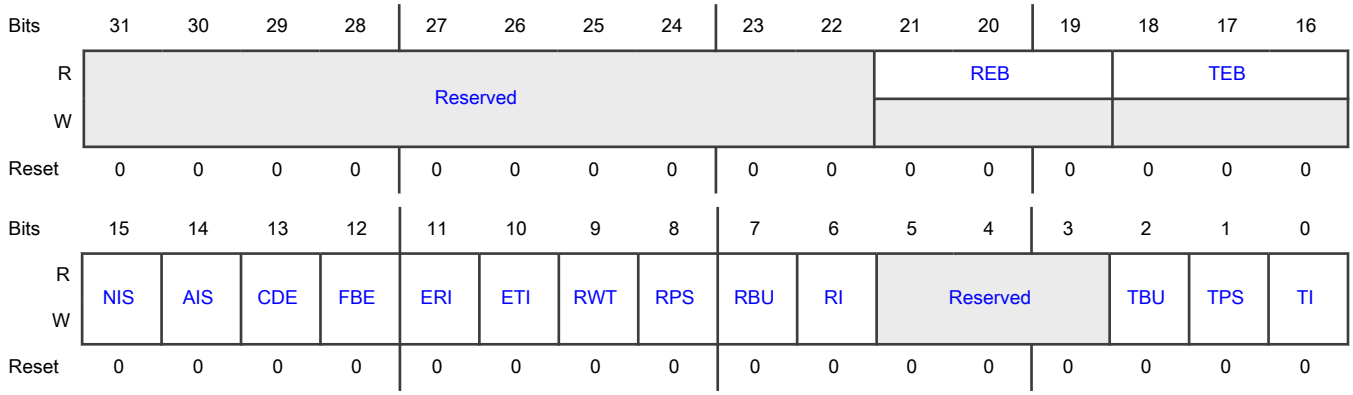
Register	Offset
DMA_CH0_Status	1160h

Function
Indicates that the software driver (application) reads the status register during an interrupt service routine or polling to determine the DMA status.

NOTE

The number of DMA_CH(#i)_Status register in the configuration is the higher of number of receive DMA channels and transit DMA channels.

Diagram



Fields

Field	Function
31-22 —	Reserved.
21-19 REB	Rx DMA Error Bits Indicates the type of error that causes a bus error. For example, error response on the AHB or AXI interface. Bit 21 1'b1 - Error during data transfer by Rx DMA 1'b0 - No Error during data transfer by Rx DMA Bit 20 1'b1 - Error during descriptor access 1'b0 - Error during data buffer access Bit 19 1'b1 - Error during read transfer 1'b0 - Error during write transfer This field is valid only when DMA_CH0_Status[FBE] = 1. This field does not generate an interrupt.
18-16 TEB	Tx DMA Error Bits Indicates the type of error that causes a bus error. For example, error response on the AHB or AXI interface. Bit 18 1'b1 - Error during data transfer by Tx DMA 1'b0 - No Error during data transfer by Tx DMA Bit 17 1'b1 - Error during descriptor access 1'b0 - Error during data buffer access

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Bit 16 1'b1 - Error during read transfer 1'b0 - Error during write transfer This field is valid only when DMA_CH0_Status[FBE] = 1. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Indicates whether the normal interrupt summary status is detected. This field is the logical OR of the following bits when you enables the corresponding interrupt bits in DMA_CH0_Interrupt_Enable: Bit 0 - Transmit interrupt Bit 2 - Transmit buffer unavailable Bit 6 - Receive interrupt Bit 11 - Early receive interrupt Only unmasked bits (interrupts for which interrupt enable sets in DMA_CH0_Interrupt_Enable) affect this field. This is a sticky bit. You must clear this field by writing 1 to it each time a corresponding field which sets this field clears. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
14 AIS	Abnormal Interrupt Summary Indicates whether an abnormal interrupt summary status is detected. This field is the logical OR of the following bits when you enables the corresponding interrupt bits in DMA_CH0_Interrupt_Enable: Bit 1 - Transmit process stopped Bit 7 - Receive buffer unavailable Bit 8 - Receive process stopped Bit 10 - Early transmit interrupt Bit 12 - Fatal bus error Bit 13 - Context descriptor error Only unmasked bits affect this field. This is a sticky bit. You must clear this field by writing 1 to it each time a corresponding field, which sets this field, clears. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Not detected 1b - Detected
13 CDE	Context Descriptor Error Indicates whether the context descriptor error status is detected. This field indicates that the DMA Tx/Rx engine receives a descriptor error, which indicates an invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in transit case and on receive side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
12 FBE	Fatal Bus Error Indicates whether the fatal bus error status is detected. This field indicates that a bus error occurred (as described in the EB field). When this field is 1, it indicates that the corresponding DMA channel engine disables all bus accesses. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
11 ERI	Early Receive Interrupt Indicates whether an early receive interrupt status is detected. When this field is 1, it indicates that the RxDMA completes the packet data transfer to the memory. In configs supporting ERIC, this field is 1 only after the receive DMA fills a complete receive buffer with packet data, when DMA_CH0_Rx_Control[ERIC] = 0. This field is 1 after every burst transfer of data from the receive DMA to the buffer, when DMA_CH0_Rx_Control[ERIC] = 1. Writing 1 to RI field automatically clears this field. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
10 ETI	Early Transmit Interrupt Indicates whether an early transmit interrupt status is detected. When this field is 1, it indicates that the TxDMA completes the packet data transfer to the MTL TXFIFO memory.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	In configs supporting ERIC: this field is 1 only after the transit DMA transfers a complete packet to MTL, when DMA_CH0_Tx_Control[ETIC] = 0. This field is 1 after packet data transfers from buffer completes (partial) in the transmit descriptor in which IOC = 1, when DMA_CH0_Tx_Control[ETIC] = 1. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
9 RWT	Receive Watchdog Timeout Indicates whether the receive watchdog timeout status is detected. Asserts when you receives a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled). 0b - Not detected 1b - Detected
8 RPS	Receive Process Stopped Indicates whether the receive process stopped status is detected. Asserts when the receive process enters the stopped state. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
7 RBU	Receive Buffer Unavailable Indicates whether the receive buffer unavailable status is detected. This field indicates that the application owns the next descriptor in the receive list, and DMA cannot acquire it. The receive process is suspended. To resume processing receive descriptors, the application must change the ownership of the descriptor and issue a receive poll demand command. If this command is not issued, the receive process resumes when you receive the next recognized incoming packet. In ring mode, the application must advance the receive descriptor tail pointer register of a channel. This field is 1 only when DMA owns the previous receive descriptor. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
6 RI	Receive Interrupt Indicates that the receive interrupt status is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field indicates that the packet reception is complete. When packet reception completes, bit 31 of RDES3 resets in the last descriptor, and you can update the specific packet status information in the descriptor. The reception remains in the running state. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
5-3 —	Reserved.
2 TBU	Transmit Buffer Unavailable Indicates whether the transmit buffer unavailable status is detected. This field indicates that the application owns the next descriptor in the transmit list, and the DMA cannot acquire it. Transmission is suspended. DMA_Debug_Status0[TPS0] explains the transmit process state transitions. To resume processing the transmit descriptors, the application must perform these steps: 1. Change the ownership of the descriptor by writing 1 to bit 31 of TDES3. 2. Issue a transmit poll demand command. For Ring mode, the application must advance the transmit descriptor tail pointer register of a channel. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
1 TPS	Transmit Process Stopped Indicates whether the transmit process stopped status is detected. This field is 1 when the transmission stops. Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
0 TI	Transmit Interrupt Indicates whether the transmit interrupt status is detected. This field indicates that the packet transmission is complete. When transmission completes, Bit 31 of TDES3 resets in the last descriptor, and you can update the specific packet status information in the descriptor.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected

78.17.262 DMA Channel 0 Miss Frame Counter (DMA_CH0_Miss_Frame_Cnt)

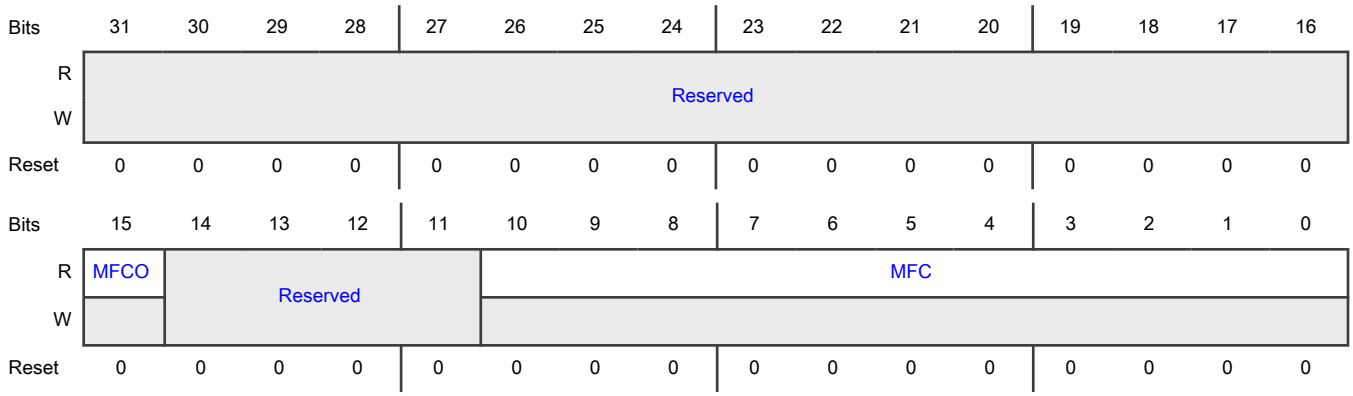
Offset

Register	Offset
DMA_CH0_Miss_Frame_Cnt	1164h

Function

Indicates the number of packet counter that DMA drops either due to bus error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Diagram



Fields

Field	Function
31-16 —	Reserved.
15 MFCO	Overflow status of the MFC Counter Indicates whether the miss frame counter overflow has occurred. When this field is 1, it indicates that the MFC counter does not increment further. This field is 0 when this register is read.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not occurred 1b - Occurred
14-11 —	Reserved.
10-0 MFC	Dropped Packet Counters Indicates the number of packet counters that DMA drops either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. This field is 0 when this register is read. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence.

78.17.263 DMA Channel 0 Rx Parser Accept Count (DMA_CH0_RXP_Accept_Cnt)

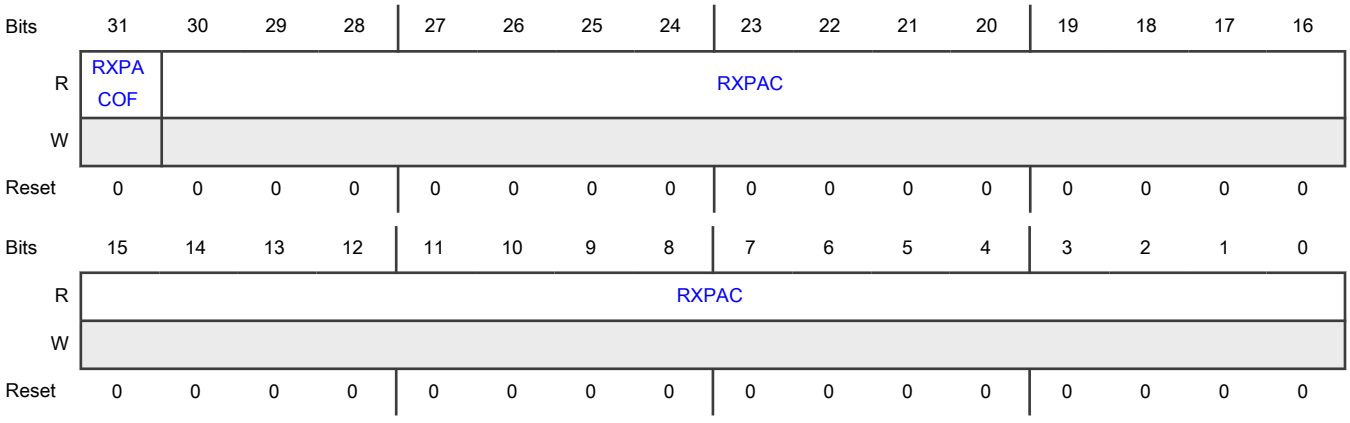
Offset

Register	Offset
DMA_CH0_RXP_Accept_Cnt	1168h

Function

Provides the count of the number of frames which the receive parser accept.

Diagram



Fields

Field	Function
31 RXPACOF	Rx Parser Accept Counter Overflow Bit Indicates whether the receive parser accept counter overflow has occurred. When this field is 1, it indicates that the RXPAC counter field has crossed the maximum limit. Access restriction apply to this field. It clears on read and automatically becomes 1 on an internal event occurrence. 0b - Not occurred 1b - Occurred
30-0 RXPAC	Rx Parser Accept Counter Implements whenever a receive parser accept a packet because AF = 1. The counter clears when the register is read.

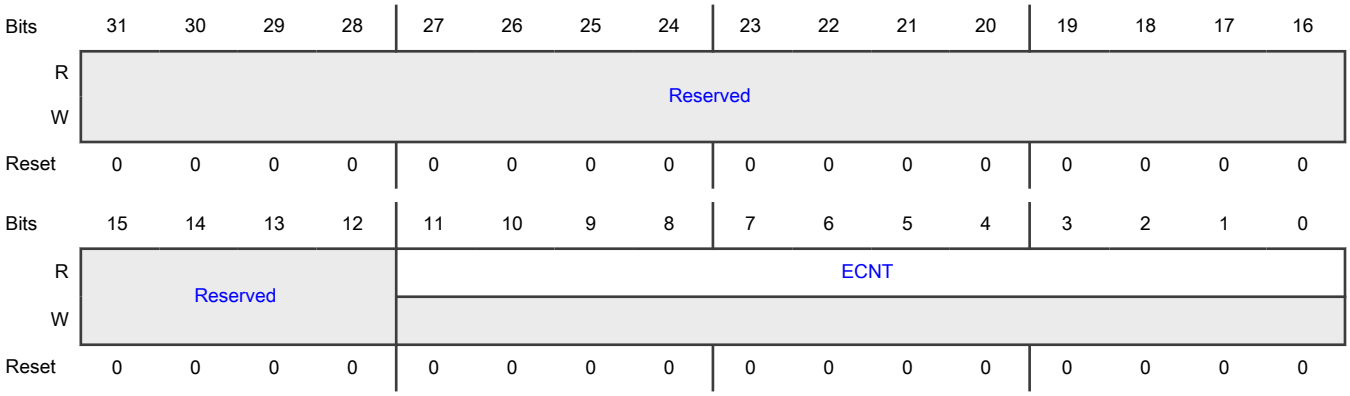
78.17.264 DMA Channel 0 Rx ERI Count (DMA_CH0_RX_ERI_Cnt)

Offset

Register	Offset
DMA_CH0_RX_ERI_Cnt	116Ch

Function
Provides the count of the number of times ERI is asserted.

Diagram



Fields

Field	Function
31-12	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
11-0 ECNT	ERI Counter Indicates that when ERIC bit of DMA_CH(#i)_RX_Control register is 1, this counter increments for burst transfer which the receive DMA completes from the start of packet transfer. This field becomes 0 at the start of new packet.

78.17.265 DMA Channel 1 Control (DMA_CH1_Control)

Offset

Register	Offset
DMA_CH1_Control	1180h

Function

Specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Diagram

Fields

Field	Function
31-25 —	Reserved.
24 —	Reserved.
23-21	Reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
20-18 DSL	Descriptor Skip Length Specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When this field is 0, it indicates that DMA takes the descriptor table as contiguous.
17 —	Reserved.
16 PBLx8	8xPBL mode Indicates whether the 8xPBL mode is enabled. When this field is 1, it indicates that you must program the PBL value in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control and multiply it eight times. Therefore, DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0b - Disabled 1b - Enabled
15-14 —	Reserved.
13-0 —	Reserved.

78.17.266 DMA Channel 1 Tx Control (DMA_CH1_Tx_Control)

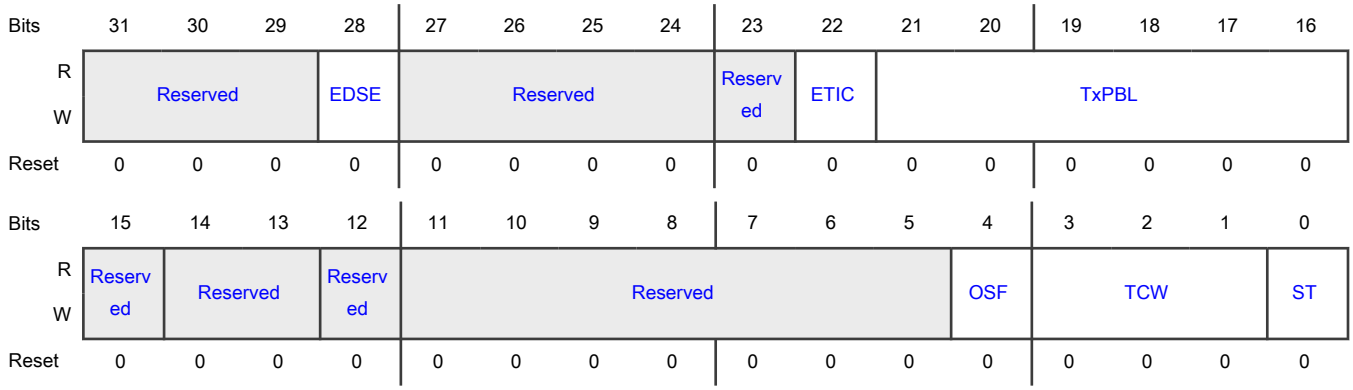
Offset

Register	Offset
DMA_CH1_Tx_Control	1184h

Function

Controls the transmit features such as PBL, TCP segmentation, and transmit channel weights.

Diagram



Fields

Field	Function
31-29 —	Reserved.
28 EDSE	Enhanced Descriptor Enable Indicates whether an enhanced descriptor is enabled. When this field is 1, it indicates that the corresponding channel uses enhanced descriptors that are 32 Bytes for both normal and context descriptors. When this field becomes 0, it indicates that the corresponding channel uses the descriptors that are 16 Bytes. 0b - Disabled 1b - Enabled
27-24 —	Reserved.
23 —	Reserved.
22 ETIC	Early Transmit Interrupt Control Indicates whether an early transmit interrupt is enabled. When this field is 1, it indicates that an early transmit interrupt (ETI) status sets after the data transfer completes from buffers of a transmit descriptor in which IOC bit (TDES2[31]) sets. When this field becomes 0, it indicates that the ETI sets only after a complete packet transfers to the MTL TX FIFO memory. 0b - Disabled 1b - Enabled
21-16	Transmit Programmable Burst Length

Table continues on the next page...

Table continued from the previous page...

Field	Function
TxPBL	Indicates the maximum number of beats to transfer in one DMA block data. DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of these values: 1, 2, 4, 8, 16, or 32. Any other value results in an undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Write 1 to DMA_CH0_Control[PBLx8]. 2. Write 1 to this field. **NOTE** The maximum value of this field must be less than or equal to half the transit queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the transit queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue controller transfers data to MAC. For example, in 64-bit data width configurations the total locations in transit queue of size 512 bytes is 64. You must program TxPBL and 8xPBL to less than or equal to 32.
15 —	Reserved.
14-13 —	Reserved.
12 —	Reserved.
11-5 —	Reserved.
4 OSF	Operate on Second Packet Indicates whether an operation on second packet is enabled. When this field is 1, it instructs DMA to process the second packet of the transmit data even before the first packet status is obtained. 0b - Disabled 1b - Enabled
3-1 TCW	Transmit Channel Weight Indicates the weight assigned to the corresponding transmit channel. When reset completes, this field becomes 0 for all channels by default, resulting in equal weights to all channels.
0 ST	Start or Stop Transmission Command Indicates whether to start or stop transmission command. When this field is 1, it indicates that the transmission is placed in the running state. DMA checks the transmit list at the current position to transmit a packet.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	DMA tries to acquire descriptor from either of the following positions: • The current position in the list. This is the base address of the transmit list which DMA_CH0_TxDesc_List_Address sets. • The position at which the transmission was previously stopped If DMA does not own the current descriptor, the transmission enters the suspended state and DMA_CH0_Status[TBU] = 1. The start transmission command is effective only when the transmission stops. If you issue the command before writing 1 to DMA_CH0_TxDesc_List_Address, then DMA behavior is unpredictable. When this field becomes 0, it indicates that the transmission process is placed in the stopped state after the transmission of the current packet completes. The next descriptor position in the transmit list is saved, and it becomes the current position when the transmission restarts. To change the list address, you must program DMA_CH0_TxDesc_List_Address with a new value when this field becomes 0. The new value is considered when this field is 1 again. The stop transmission command is effective only when the transmission of the current packet completes or the transmission is in the suspended state. 0b - Stop 1b - Start

78.17.267 DMA Channel 1 Rx Control (DMA_CH1_Rx_Control)

Offset

Register	Offset
DMA_CH1_Rx_Control	1188h

Function

Controls the receive features such as PBL, buffer size, and extended status.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31 RPF	Rx Packet Flush Indicates whether the receive packet flush is enabled. When this field is 1, it indicates that the module automatically flushes the packet from the receive queues destined to this DMA receive channel, when it stops. When this field remains 1 and the software driver re-starts DMA, the packets residing in the receive queues that were received when this RxDMA was stopped, flushes out. Route the packets to the RxDMA that the MAC receives after the RxDMA re-starts. The flushing takes place on the read side of the receive queue. When this field is 0, it indicates that the module do not flush the packet in the receive queue destined to this RxDMA channel when it is in stop state. This might in turn cause head-of-line blocking in the corresponding RxQueue. **NOTE** The stopping of packet flow from a Rx DMA Channel to the application by writing 1 to this field works only when there is one-to-one mapping of receive queue to the receive DMA channels. In Dynamic mapping mode, writing 1 to this field in any DMA_CH(#i)_Rx_Control register might flush packets from unintended receive queues which are destined to the stopped Rx DMA Channel. 0b - Disabled 1b - Enabled
30-28 —	Reserved.
27-24 —	Reserved.
23 —	Reserved.
22 ERIC	Early Receive Interrupt Control Indicates whether an early receive interrupt control status is enabled. When this field is 1, it indicates that an early receive interrupt (ERI) status sets after every burst transfer of data from the receive DMA to the buffer completes. When this field becomes 0, it indicates that ERI sets only after the RxDMA fills the complete buffer is filled. 0b - Disabled 1b - Enabled
21-16 RxPBL	Receive Programmable Burst Length Indicates the maximum number of beats to transfer in one DMA block data. DMA always attempts max burst as specified in PBL, each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in an undefined behavior. To transfer more than 32 beats, perform the following steps:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1. Write 1 to DMA_CH0_Control[PBLx8]. 2. Write 1 to RxPBL. **NOTE** The maximum value of RxPBL must be less than or equal to half the receive queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the receive queue has space to store at least another Rx PBL worth of data when the receive DMA transfers a block of data. For example, in 64-bit data width configurations the total locations in receive queue of size 512 bytes is 64, so you must program RxPBL and 8xPBL to less than or equal to 32.
15 —	Reserved.
14-3 RBSZ_13_y	Receive Buffer size High Indicates that RBSZ[13:0] splits into two fields higher RBSZ_13_y and lower RBSZ_x_0. RBSZ[13:0] field indicates the size of the receive buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when you enable split headers. **NOTE** The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
2-1 RBSZ_x_0	Receive Buffer size Low Indicates that RBSZ[13:0] splits into two fields RBSZ_13_y and RBSZ_x_0. RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field width is of 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive Indicates whether to start or stop receive. When this field is 1, it indicates that DMA tries to acquire the descriptor from the receive list and processes the incoming packets. DMA tries to acquire descriptor from either of the following positions: • The current position in the list. This is the address that DMA_CH0_RxDesc_List_Address sets. • The position at which the receive process was previously stopped If DMA does not own the current descriptor, the reception suspends and DMA_CH0_Status[RBU] = 1. The start receive command is effective only when the reception stops. If the command is issued before writing 1 to DMA_CH0_RxDesc_List_Address, DMA behavior is unpredictable.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field becomes 0, it indicates that the receive DMA operation stops after the transfer of the current packet. The next descriptor position in the receive list is saved, and it becomes the current position after the receive process restarts. The stop receive command is effective only when the receive process is in the running (waiting for Rx packet) or suspended state. 0b - Stop 1b - Start

78.17.268 DMA Channel 1 Tx Descriptor List Address (DMA_CH1_TxDesc_List_Address)

Offset

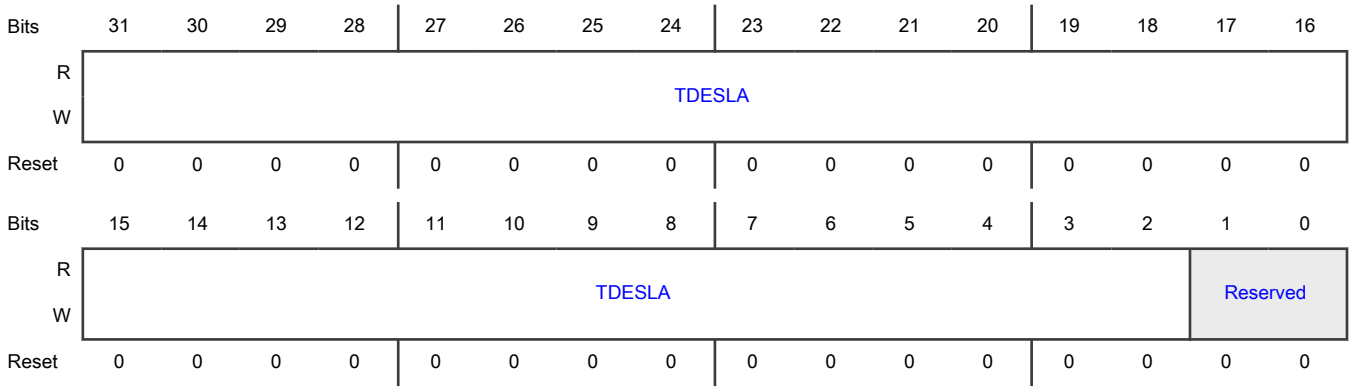
Register	Offset
DMA_CH1_TxDesc_List_Address	1194h

Function

Specifies DMA to the start of transmit descriptor list. The descriptor lists reside in the application's physical memory space and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA converts the corresponding LSB bits to low to internally convert the descriptor lists to bus width aligned address.

You can write to this register only when the transmit DMA stops, that is, DMA_CH0_Tx_Control[ST] = 0. When stopped, you can write this register with a new descriptor list address. When DMA_CH0_Tx_Control[ST] = 1, the DMA takes the newly-programmed descriptor base address. If this register do not change when DMA_CH0_Tx_Control[ST] = 0, DMA takes the descriptor address where it was stopped earlier.

Diagram



Fields

Field	Function
31-2	Start of Transmit List

Table continues on the next page...

Table continued from the previous page...

Field	Function
TDESLA	Contains the first descriptor base address in the transmit descriptor list. DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally assumes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The field width depends on the configuration: 31:2 for 32-bit configuration 31:3 for 64-bit configuration 31:4 for 128-bit configuration
1-0 —	Reserved.

78.17.269 DMA Channel 1 Rx Descriptor List Address (DMA_CH1_RxDesc_List_Address)

Offset

Register	Offset
DMA_CH1_RxDesc_List_Address	119Ch

Function

Specifies DMA to the start of receive descriptor list. The descriptor lists resides in the application's physical memory space and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). DMA converts the corresponding LS bits low to internally convert the descriptor lists to bus width aligned address. You can write to this register only when reception stops. When stopped, you must write this register before the receive start command is given.

You can write to this register when receive DMA has stopped, that is, DMA_CH0_Rx_Control[SR] = 0. When stopped, you can this register with a new descriptor list address.

When DMA_CH0_Rx_Control[SR] = 1, DMA takes the newly programmed descriptor base address.

0 TIE	Transmit Interrupt Enable Enables or disables the transmit interrupt. When this field is 1 along with DMA_CH0_Interrupt_Enable[NIE], it enables the transmit interrupt. When this field becomes 0, it disables the transmit interrupt. 0b - Disable 1b - Enable

78.17.275 DMA Channel 1 Rx Interrupt Watchdog Timer (DMA_CH1_Rx_Interrupt_Watchdog_Timer)

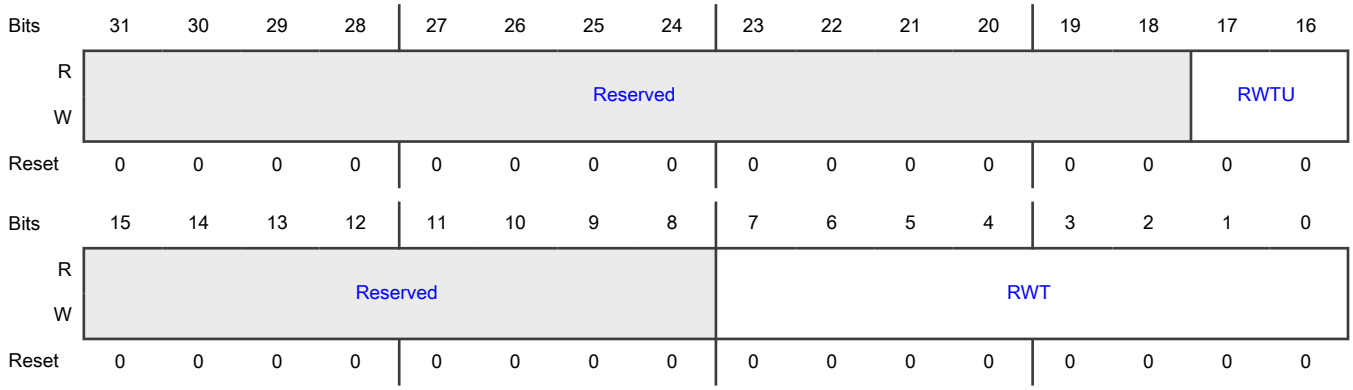
Offset

Register	Offset
DMA_CH1_Rx_Interrupt_Watchdog_Timer	11B8h

Function

Indicates the watchdog timeout for receive interrupt (RI) from DMA. When you write this register with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Diagram



Fields

Field	Function
31-18 —	Reserved.
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units Indicates the number of system clock cycles corresponding to one unit in DMA_CH1_Rx_Interrupt_Watchdog_Timer[RWT]. 2'b00 - 256 2'b01 - 512 2'b10 - 1024 2'b11 - 2048 For example, the watchdog timer sets for 2*512=1024 system clock cycles, when DMA_CH1_Rx_Interrupt_Watchdog_Timer[RWT] = 2 and DMA_CH1_Rx_Interrupt_Watchdog_Timer[RWTU] = 1.
15-8 —	Reserved.
7-0 RWT	Receive Interrupt Watchdog Timer Count Indicates the number of system clock cycles, multiplied by factor indicated in DMA_CH1_Rx_Interrupt_Watchdog_Timer[RWTU], for which the watchdog timer sets. The watchdog timer triggers with the programmed value after the receive DMA completes the packet transfer for which the RI bit is not 1 in DMA_CH(#i)_Status register, because of the setting of interrupt enable bit in the corresponding descriptor RDES3[30]. RI bit is 1 and the timer stops when the watchdog timer runs out. The watchdog timer becomes 0 when RI bit is 1 because RI sets automatically per the interrupt enable bit RDES3[30] of any received packet.

78.17.276 DMA Channel 1 Slot Function Control Status (DMA_CH1_Slot_Function_Control_Status)

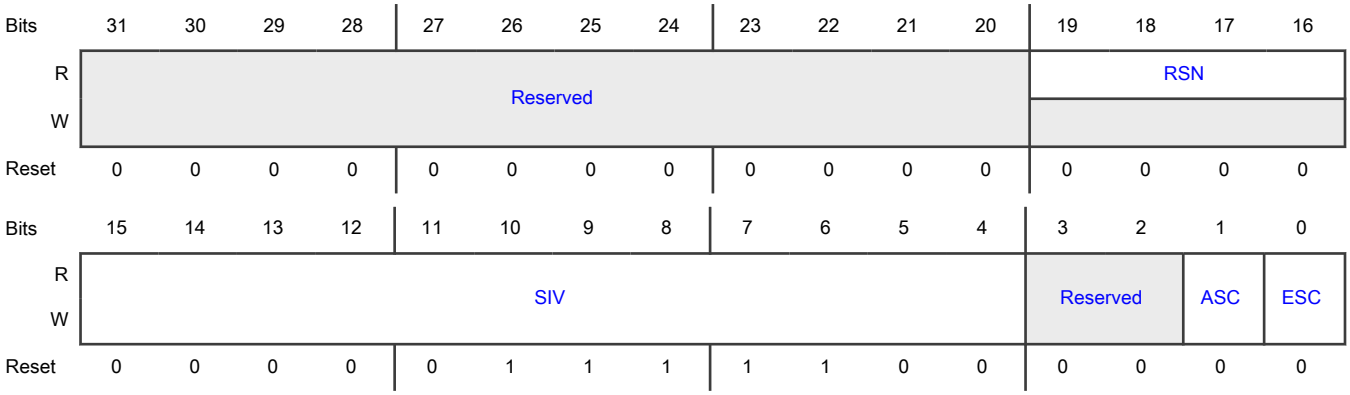
Offset

Register	Offset
DMA_CH1_Slot_Function_Control_Status	11BCh

Function

Contains the control field for slot function and the status for transmit path.

Diagram



Fields

Field	Function
31-20 —	Reserved.
19-16 RSN	Reference Slot Number Provides the current value of the reference slot number in DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value Controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096 us. The default or reset value is 0x07C which corresponds to slot interval of 125 us.
3-2 —	Reserved.
1 ASC	Advance Slot Check Indicates whether an advance slot check is enabled. When this field is 1, it enables DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the transmit descriptor is:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• Equal to the reference slot number given in DMA_CH1_Slot_Function_Control_Status[RSN], or • Ahead of the reference slot number by up to two slots. This field is applicable only when DMA_CH1_Slot_Function_Control_Status[ESC] = 1. 0b - Disabled 1b - Enabled
0 ESC	Enable Slot Comparison Enables slot comparison. When this field is 1, it enables the checking of the slot numbers programmed in the transmit descriptor with the current reference given in DMA_CH1_Slot_Function_Control_Status[RSN]. DMA fetches the data from the corresponding buffer only when the slot number is: • Equal to the reference slot number, or • Ahead of the reference slot number by one slot. When this field becomes 0, it disables the checking of the slot numbers. DMA fetches the data immediately after you process the descriptor. **NOTE** You must not enable the UFO (UDP Fragmentation over IPv4)/TSO/USO along with TBS/AVB slot number check. The UFO/TSO/USO involves multiple packets or segments or fragments transmission for single packet received from application and the slot number check are applicable for fetching only first segment/fragment. As a result it might be difficult for you to specify slot number for subsequent packets. 0b - Disable 1b - Enable

78.17.277 DMA Channel 1 Current Application Transmit Descriptor (DMA_CH1_Current_App_TxDesc)

Offset

Register	Offset
DMA_CH1_Current_App_TxDesc	11C4h

Function
Specifies the current transmit descriptor which DMA reads.

Field	Function
	Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
13 CDE	Context Descriptor Error Indicates whether the context descriptor error status is detected. This field indicates that the DMA Tx/Rx engine receive a descriptor error, which indicates an invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in transmit case and on receive side. It indicates that DMA has read a descriptor with either of the buffer address as ones which you can consider invalid. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
12 FBE	Fatal Bus Error Indicates whether the fatal bus error status is detected. This field indicates that a bus error has occurred (as described in the EB field). When this field is 1, it indicates that the corresponding DMA channel engine disables all bus accesses. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
11 ERI	Early Receive Interrupt Indicates whether an early receive interrupt status is detected. When this field is 1, it indicates that the RxDMA has completed the packet data transfer to the memory. In configs supporting ERIC, When DMA_CH1_Rx_Control[ERIC] = 0, this field is 1 only after the Rx DMA fills a complete receive buffer with packet data. When DMA_CH1_Rx_Control[ERIC] = 1, this field is 1 after every burst data transfer from the receive DMA to the buffer. If DMA_CH1_Status[RI] = 1, this field clears automatically. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
10 ETI	Early Transmit Interrupt Indicates whether an early transmit interrupt status is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this field is 1, it indicates that the TxDMA has completed the packet data transfer to the MTL TXFIFO memory. In configs supporting ERIC: When DMA_CH1_Tx_Control[ETIC] = 0, this field is 1 only after the Tx DMA transfers a complete packet to MTL. When DMA_CH1_Tx_Control[ETIC] = 1, this field is 1 after the packet data transfer completes (partial) from buffers in the Transmit descriptor in which IOC=1. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
9 RWT	Receive Watchdog Timeout Indicates whether a receive watchdog timeout status is detected. This field asserts when it receives a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled). 0b - Not detected 1b - Detected
8 RPS	Receive Process Stopped Indicates whether a receive process stopped status is detected. This field asserts when the receive process enters the stopped state. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
7 RBU	Receive Buffer Unavailable Indicates whether a receive buffer unavailable status is detected. This field indicates that the application owns the next descriptor in the receive list, and the DMA cannot acquire it. The receive process is suspended. To resume processing receive descriptors, the application must change the ownership of the descriptor and issue a receive poll demand command. If this command is not issued, the receive process resumes when you receives the next recognized incoming packet. In Ring mode, the application must advance the receive descriptor tail pointer register of a channel. This field is 1 only when the DMA owns the previous receive descriptor. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
6 RI	Receive Interrupt Indicates whether the receive interrupt status is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field indicates that the packet reception is complete. Bit 31 of RDES3 resets in the last descriptor, and updates the specific packet status information in the descriptor, when the packet reception is complete. The reception remains in the running state. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
5-3 —	Reserved.
2 TBU	Transmit Buffer Unavailable Indicates whether the transmit buffer unavailable status is detected. This field indicates that the application owns the next descriptor in the transmit list, and the DMA cannot acquire it. Transmission is suspended. DMA_Debug_Status0[TPS0] explains the transmit process state transitions. The application must perform these actions, to resume the processing of transmit descriptors: 1. Write 1 to bit 31 of TDES3 to change the ownership of the descriptor. 2. Issue a transmit poll demand command. For Ring mode, the application must advance the transmit descriptor tail pointer register of a channel. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
1 TPS	Transmit Process Stopped Indicates that the transmit process stopped status is detected. This field is 1 when the transmission stops. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect. 0b - Not detected 1b - Detected
0 TI	Transmit Interrupt Indicates whether the transmit interrupt status is detected. This field indicates that the packet transmission is complete. When transmission completes, bit 31 of TDES3 resets in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction apply to this field. Automatically becomes 1 on an internal event occurrence. Writing 1 clears this field and writing 0 has no effect.

Low Power Universal Asynchronous Receiver/ Transmitter (LPUART)

79.1 Chip-specific LPUART information

79.1.1 LPUART instances and configuration

The following are the LPUART instances

- LPUART_0
- LPUART_1
- LPUART_2
- LPUART_3
- LPUART_MSC

NOTE

MODBUS is supported for only LPUART0/1.

NOTE

CTS/RTS hardware triggering is supported for only LPUART0/1/2.

NOTE

LPUART MSC instance supports only receiving of data and not transmission of data.

Table 680. LPUART Configuration

Feature	Configuration
S32K396	
TX FIFO size	16 Words (for instance 0,1) 4 Words (for instance 2,3, LPUART_MSC)
RX FIFO size	16 Words (for instance 0,1) 4 Words (for instance 2,3, LPUART_MSC)
Functionality supported	Standard LPUART functionality with MODEM/IrDA and MODBUS support.
	LIN master and slave operation

NOTE

LPUART instances are not available during Standby.

79.2 Overview

LPUART provides asynchronous, serial communication capabilities with external devices. It supports the non-return-to-zero (NRZ) encoding format and infrared data association (IrDA)-compatible, low-speed serial infrared (SIR) protocol. LPUART can continue operating when the processor is in Low-Power mode, if an appropriate peripheral clock is available.

79.2.1 Block diagram

Figure 593 shows the transmitter portion of LPUART.

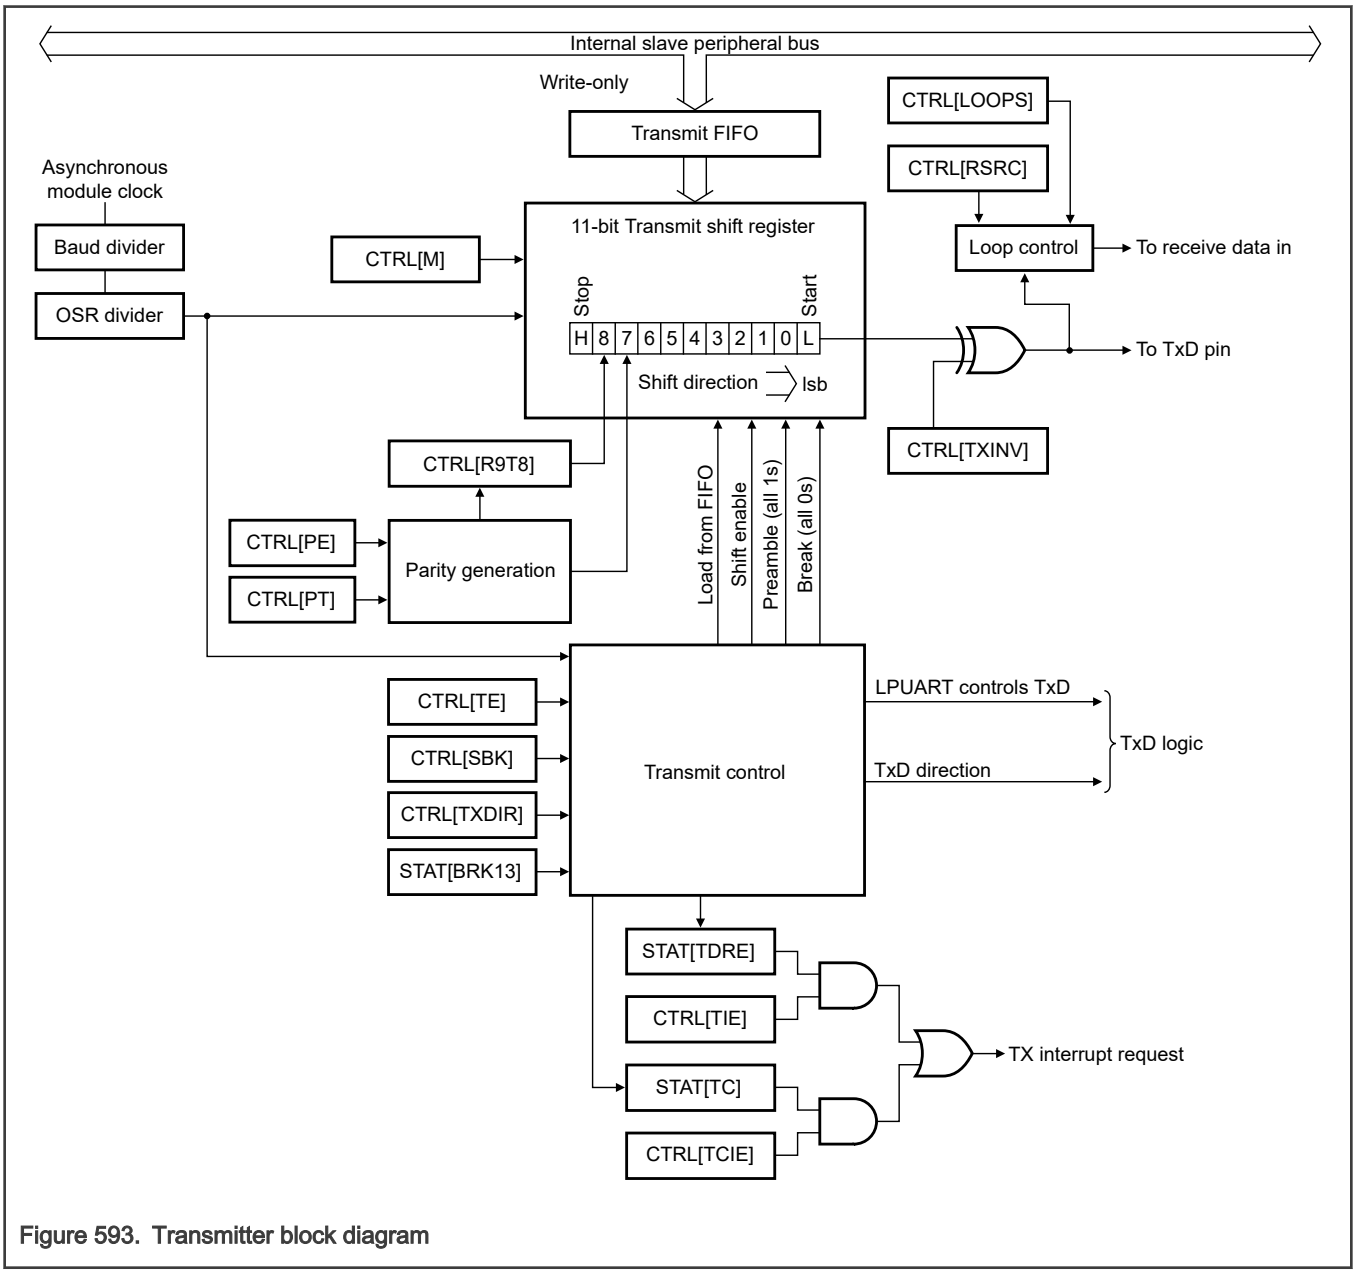

Figure 593. Transmitter block diagram

Figure 594 shows the receiver portion of LPUART.

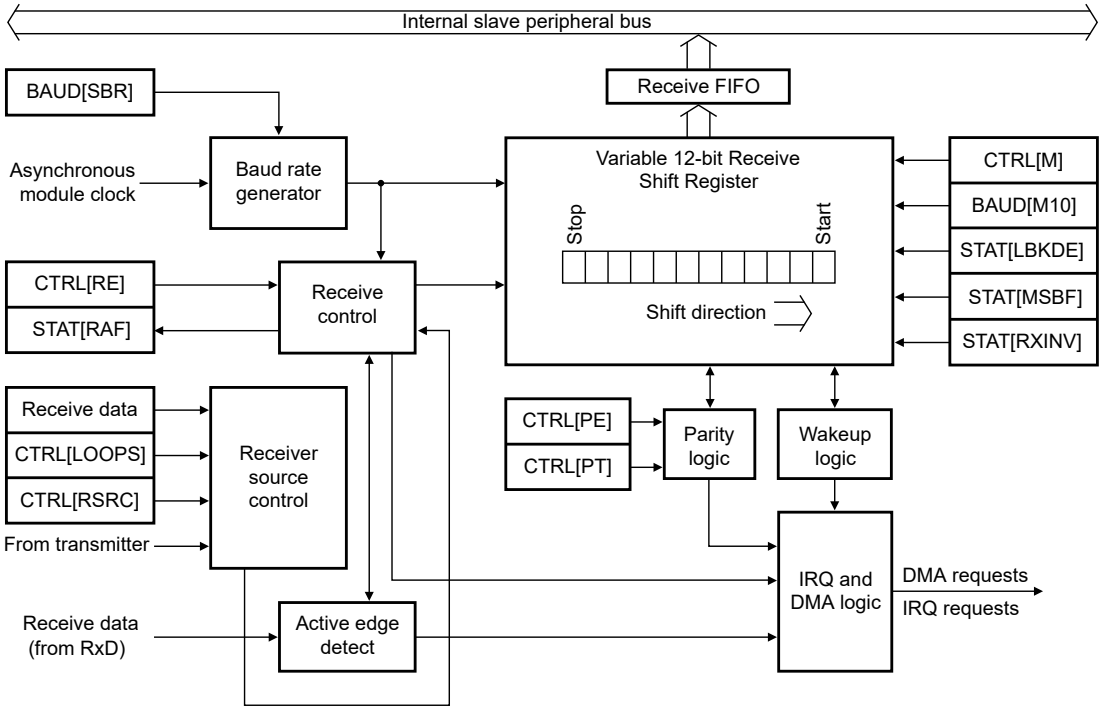

Figure 594. Receiver block diagram

79.2.2 Features

- Full-duplex, standard NRZ format
- Programmable baud rates (13-bit modulo divider) with a configurable oversampling ratio (OSR) from 4× to 32×
- Asynchronous operation of transmit and receive baud rates with respect to the bus clock:
  - Baud rate can be configured independently of the bus clock frequency.
  - Operation in Low-Power modes is supported.
- Interrupt, DMA, or polled operations:
  - Transmit data empty and transmission complete
  - Receive data full
  - Receive overrun, parity error, framing error, and noise error
  - Idle receiver detect
  - Active edge on receive pin
  - Break detect supporting LIN
  - Receive data match
- Hardware parity generation and checking
- Programmable 7-bit, 8-bit, 9-bit, or 10-bit character length
- Programmable 1-bit or 2-bit stop bits
- Support for three receiver wake-up methods:
  - Idle line wake-up

  - Address mark wake-up
  - Receive data match
- Automatic address matching to reduce ISR overhead:
  - Address mark matching
  - Idle line address matching
  - Address match start, address match end
- Optional 13-bit and 11-bit break character generation
- Configurable idle length detection supporting 1, 2, 4, 8, 16, 32, 64, or 128 idle characters
- Selectable transmitter output and receiver input polarity
- Hardware flow control support for request to send (RTS) and clear to send (CTS) signals
- Selectable IrDA 1.4 return-to-zero-inverted (RZI) format with a programmable pulse width
- Independent FIFO structure for transmit and receive functions:
  - Separate configurable watermarks for receive and transmit requests
  - Option for receiver to assert request after a configurable number of idle characters, if receive FIFO is not empty

79.3 Functional description

LPUART supports full-duplex, asynchronous, NRZ serial communication and comprises a baud rate generator, transmitter, and receiver block. The transmitter and receiver operate independently, although they use the same baud rate generator. The following sections describe all LPUART blocks.

79.3.1 Baud rate generation

A 13-bit modulus counter in the baud rate generator derives the baud rate for both the receiver and transmitter. The value, ranging from 1 to 8191, written to BAUD[SBR] determines the baud clock divisor for the asynchronous LPUART baud clock. The baud rate clock drives the receiver, while a bit clock, generated from the baud rate clock divided by the OSR, drives the transmitter. Depending on the OSR, the receiver has an acquisition rate of 4 to 32 samples per bit time.

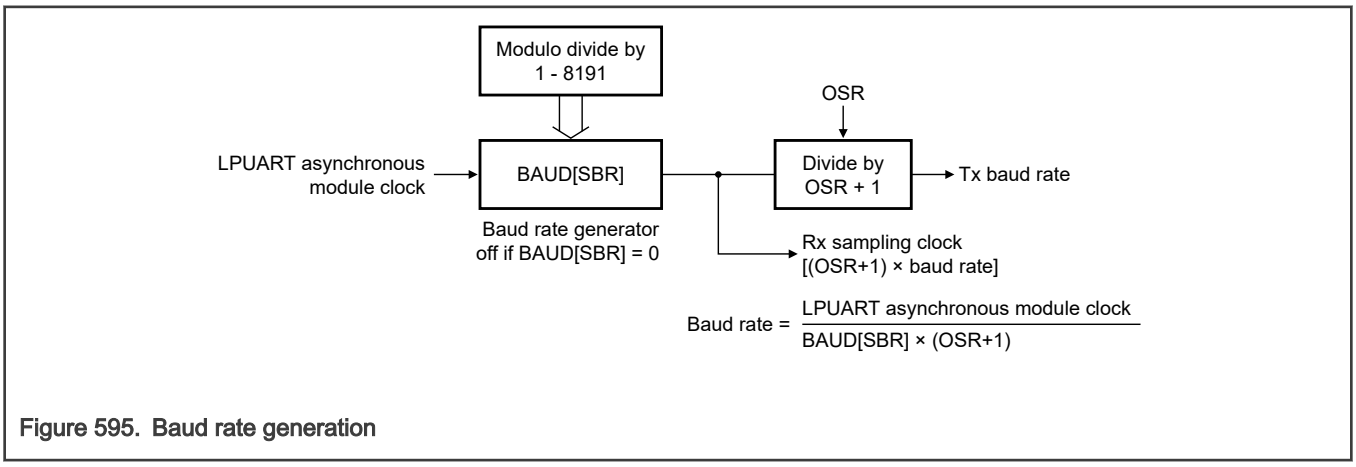

Figure 595. Baud rate generation

Baud rate generation is subject to these sources of error:

- Integer division of the asynchronous LPUART baud clock may not give the exact target frequency.
- Synchronization with the asynchronous LPUART baud clock can lead to a phase shift.

Baud rate generation is a free-running counter that continues whenever the transmitter or receiver is enabled. The transmitter bit clock continues whenever the transmitter is enabled; each transmitted character aligns to the next edge of the transmit bit clock.

In general, configuring OSR for a higher ratio and/or sampling on both edges of the clock slightly improves LPUART's tolerance to baud rate mismatch between the received data and LPUART configured baud rate. However, the three data samples in each bit (see Data sampling technique) are also closer together, which may impact noise sensitivity.

79.3.2 Baud rate tolerance

A transmitting device may operate at a baud rate below or above that of the receiver.

Accumulated bit time misalignment can cause one of the three stop bit data samples to fall outside the actual stop bit. A noise error will occur if the three samples are not all the same logical values. A framing error will occur if the receiver clock is misaligned in such a way that the majority of the three stop bit samples are a logic zero.

As the receiver samples an incoming frame, it may re-synchronize the oversampling clock on any valid falling edge within the frame. Resynchronization within frames will correct a misalignment between transmitter bit times and receiver bit times.

In general, increasing the number of samples per bit will increase the baud rate tolerance and decreasing the number of samples per bit will reduce the baud rate tolerance. Note that since LPUART implements triple voting on consecutive receive data samples, increasing the number of samples per bit will move those samples closer together which would reduce the width of noise that can be filtered by the triple voting logic.

79.3.3 Calculating baud rate tolerance

Using the following definitions:

- SAM is the number of sample points per bit (valid range from 8 to 32; equal to (OSR + 1) × (BOTHEDGE + 1)).
- BIT is the number of bits in a character including start, data and stop bits (valid range from 9 to 13).

The ideal baud rate tolerance can be calculated as follows:

- Slow data rate tolerance = ((SAM ÷ 2) - 1) ÷ ((SAM × BIT) - (SAM ÷ 2) + 2)
- Fast data rate tolerance = ((SAM ÷ 2) - 2) ÷ (SAM × BIT)

As an example, if configured for 8-bit data, 1 stop bit (BIT = 10) and with OSR=0x7 and BOTHEDGE = 1 (SAM = 16):

- Slow data rate tolerance = (8 - 1) ÷ (160 - 8 + 2) = 7 ÷ 154 = 4.54%
- Fast data rate tolerance = (8 - 2) ÷ 160 = 6 ÷ 160 = 3.75%

If configured for 9-bit data with 1 stop bit (BIT = 11) with same oversampling configuration, then:

- Slow data rate tolerance = (8 - 1) ÷ (176 - 8 + 2) = 7 ÷ 170 = 4.12%
- Fast data rate tolerance = (8 - 2) ÷ 176 = 6 ÷ 176 = 3.41%

NOTE

Additional factors can contribute to a lower baud rate tolerance than the ideal. These include clock uncertainty or jitter on the LPUART functional clock source, differences in rise and fall times on the transmitter output and synchronization of the external receive pin to the local LPUART functional clock.

79.3.4 Transmitter functional description

This section describes the functioning of the LPUART transmitter, as shown in the transmitter portion of Block diagram, as well as specialized functions for sending break and idle characters.

The transmitter output (TXD) idle state defaults to logic high; the transmitter output is inverted when you write 1 to CTRL[TXINV], which becomes 0 following reset. You can enable the transmitter by writing 1 to CTRL[TE]. This queues a preamble character that is one full character frame of the Idle state. The transmitter then remains idle until data is available in the transmit FIFO and programs store data in the transmit FIFO by writing to Data (DATA).

The central element of the LPUART transmitter is the transmit shift register that is 9-bit to 13-bit long depending on the settings of CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS]. Going forward in this discussion, assume that CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS] are 0, selecting the normal 8-bit Data mode, in which the shift register holds a start bit, eight data

bits, and a stop bit. When the transmit shift register is available for a new character, the value waiting in transmit FIFO is transferred to the transmit shift register, synchronized with the baud rate clock, and STAT[TDRE] becomes 1 to indicate that another character may be written to the transmit FIFO at Data (DATA).

If no new character is waiting in the transmit FIFO after a stop bit is shifted out of the TXD pin, the transmitter sets the transmit complete flag and enters an idle mode, with TXD high, waiting for more characters to transmit.

Writing 0 to CTRL[TE] does not immediately disable the transmitter. The current transmit activity in progress must first be completed (that could include a data character, idle character, or break character), although the transmitter does not start transmitting another character.

79.3.4.1 Break character length

CTRL[SBK] sends break characters, originally used to gain the attention of old teletype receivers. Break characters are a full character time of logic 0, 9-bit to 12-bit times, including the start and stop bits. You can enable a longer break of 13-bit times by writing 1 to STAT[BRK13]. Normally, a program waits for STAT[TDRE] to become 1 to indicate that the last character of a message has moved to the transmit shifter. Next, the program writes 1 and then writes 0 to CTRL[SBK]. This action queues a break character to be sent as soon as the shifter is available. If CTRL[SBK] remains 1 when the queued break moves into the shifter, synchronized with the baud rate clock, an additional break character is queued. When LPUART is the receiving module, it receives a break character as 0s in all data bits and a framing error (STAT[FE] = 1) is detected.

You can also transmit a break character by writing to Data (DATA) with DATA[FRETSC] = 1 and the data bits clear. This supports transmitting the break character as part of the normal data stream and also allows DMA to transmit a break character.

When idle line wake-up is used, a full character time of idle (logic 1) is needed between messages to wake up any sleeping receivers. Normally, a program waits for STAT[TDRE] to become 1 to indicate that the last character of a message has moved to the transmit shifter. Next, write 0 and then write 1 to CTRL[TE]. This action queues an idle character to be sent as soon as the shifter is available. As long as the character in the shifter does not finish while CTRL[TE] becomes 0, the LPUART transmitter does not release control of the TXD pin.

You can also write to Data (DATA) to transmit an idle character, with DATA[FRETSC] and DATA[R9T9] = 1 and the values of all the other fields = 0. This supports transmitting the idle character as part of the normal data stream and also allows DMA to transmit an idle character.

As shown in the following table, STAT[BRK13], CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS] affect the length of the break character.

Table 681. Break character length

STAT[BRK13]	CTRL[M]	BAUD[M10]	CTRL[M7]	BAUD[SBNS]	Break character length (in bit times)
0	0	0	0	0	10
0	0	0	0	1	11
0	0	0	1	0	9
0	0	0	1	1	10

0	—	1	—	1	13
1	0	0	0	0	13
1	0	0	0	1	13
1	0	0	1	0	12

Table continues on the next page...

Table 681. Break character length (continued)

STAT[BRK13]	CTRL[M]	BAUD[M10]	CTRL[M7]	BAUD[SBNS]	Break character length (in bit times)
1	0	0	1	1	12
1	1	0	—	0	14
1	1	0	—	1	14
1	—	1	—	0	15
1	—	1	—	1	15

79.3.4.2 Hardware flow control

The transmitter supports hardware flow control by gating the transmission with the value of CTS_B. If the CTS operation is enabled, the character is transmitted when CTS_B is asserted. If CTS_B is deasserted in the middle of a transmission with characters remaining in the transmitter FIFO, the character in the transmit shift register is complete. Any characters in the FIFO wait for CTS_B to assert again, and TXD remains in the mark state (idle state) until CTS_B is reasserted. The CTS_B pin must assert for longer than one bit period to guarantee that a new transmission is started when the transmitter is idle with CTS.

If the CTS operation is disabled, the transmitter ignores the state of CTS_B.

The transmitter's CTS_B signal can be enabled even if the same LPUART receiver's RTS_B signal is disabled.

79.3.4.3 Transceiver driver enable

The transmitter can use RTS_B as an enable signal for the driver of an external transceiver. See Transceiver driver enable using RTS_B for details. If the RTS operation is enabled, when a character is placed into an empty transmit shift register, RTS_B asserts 1-bit time before the start bit is transmitted. RTS_B remains asserted for the whole time that the transmit shift register has any characters. RTS_B deasserts 1-bit time after all characters in the transmit FIFO and shift register are completely sent, including the last stop bit. In other words, when RTS_B is used as a transceiver enable, RTS_B asserts 1-bit time before the transmitter starts transmitting and negates 1-bit time after the transmitter goes idle.

Transmitting a break character also asserts RTS_B, with the same assertion and deassertion timing as having a character in the transmit shift register.

The transmitter's RTS_B signal asserts only when the transmitter is enabled. However, the transmitter's RTS_B signal is unaffected by its CTS_B signal. RTS_B remains asserted until the transfer is complete, even if the transmitter is disabled mid-way through a data transfer.

You can configure HDCR[RTSEXT] to the desired length by delaying the transmitter's RTS_B negation by up to 256-bit clock (baud rate) after the last stop bit.

79.3.4.4 Transceiver driver enable using RTS_B

RS-485 is a multiple drop communication protocol in which the LPUART transceiver's driver is three-stated unless LPUART is driving. The transmitter can use the RTS_B signal to enable the driver of a transceiver. The polarity of RTS_B can be matched to the polarity of the transceiver's driver enable signal.

The following figure shows the receiver enable signal asserted. This connection can also connect RTS_B to both DE and RE_B. The transceiver's receiver is disabled when driving. A pullup can pull RXD to a nonfloating value during this time. You can refine this option further by operating LPUART in Single-Wire mode, freeing the RXD pin for other uses.

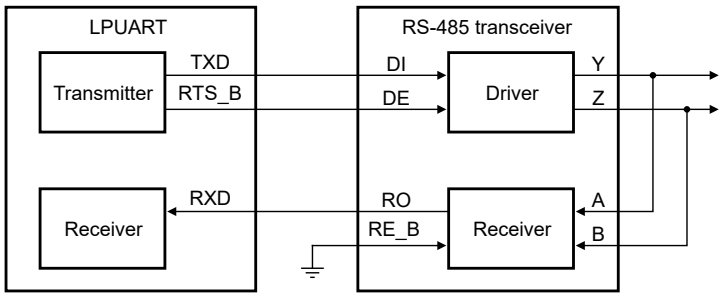

Figure 596. Transceiver driver enable using RTS_B

79.3.5 Receiver functional description

This section discusses the functioning of the LPUART receiver, as shown in the receiver portion of Block diagram. The section also discusses:

- The data sampling technique used to reconstruct receiver data.
- Different variations of the receiver wake-up function.

You can invert the receiver input by writing 1 to STAT[RXINV] and enable the receiver by writing 1 to CTRL[RE]. Character frames consist of a start bit of logic 0, along with N (7, 8, 9, 10) bits (MSB or LSB first), and one or two stop bits of logic 1. For information about 7-bit, 9-bit, or 10-bit Data mode, see Data modes. Going forward in this discussion, assume that LPUART is configured for a normal 8-bit Data mode.

After receiving the stop bit into the receive shifter, and provided the receive data register is not already full (STAT[RDRF] = 0), the data character is transferred to the receive FIFO, resulting in STAT[RDRF] becoming 1. However, if STAT[RDRF] is already 1, indicating that the receive data buffer is already full, STAT[OR] becomes 1 and the new data is lost.

Because the LPUART receiver is separate from the receive FIFO, the receive shift register can receive the next word when the receive FIFO is full, and it is only at the end of the character that the next data is written into the receive FIFO, potentially triggering the overrun flag if the FIFO is full.

When a program detects that the receive data register is full (STAT[RDRF] = 1), it gets the data from the FIFO by reading Data (DATA). See Interrupts for details about flag clearing.

79.3.5.1 Data sampling technique

The LPUART receiver supports a configurable oversampling rate of between 4× and 32× of the baud rate clock for sampling. The receiver starts by considering logic level samples at the oversampling rate times the baud rate to search for a falling edge on the RXD serial data input pin. A falling edge is defined as a logic 0 sample after three consecutive logic 1 samples. The oversampling baud rate clock divides the bit time into 4 to 32 segments from 1 to OSR (where OSR is the configured oversampling ratio). When a falling edge is located, three more samples are taken at (OSR ÷ 2), (OSR ÷ 2) + 1, and (OSR ÷ 2) + 2 to ensure that this is a real start bit and not merely noise. If at least two of these three samples are 0, the receiver assumes they are synchronized to a received character. If another falling edge is detected before the receiver is considered synchronized, the receiver restarts sampling from the first segment.

The receiver then samples each bit time, including the start and stop bits, at (OSR ÷ 2), (OSR ÷ 2) + 1, and (OSR ÷ 2) + 2, to determine the logic level for that bit. The logic level is interpreted to be that of the majority of the samples taken during the bit time. If any sample in any bit time, including the start and stop bits, in a character frame fails to agree with the logic level for that bit, noise flag (STAT[NF]) becomes 1 when the received character is transferred to the receive FIFO.

When the LPUART receiver is configured to sample on both edges of the baud rate clock (that is, when BAUD[BOTHEDGE] = 1), the number of segments in each received bit is effectively doubled (from 1 to OSR× 2). The start and data bits are then sampled at OSR, OSR + 1, and OSR + 2. You must enable sampling on both edges of the clock for oversampling rates of 4× to 7×. This sampling is optional for higher oversampling rates.

The synchronization feature of LPUART synchronizes the internal oversampling counter with a detected falling edge on the receive signal, and to adjust the data sampling window. The falling edge detection needs three consecutive 1s prior to the "1->0" (one to zero) transition. After the initial falling edge detection for the start bit, the circuit continuously monitors the next falling edge, and resets the counter after another falling edge is detected. This synchronization to the start bit is termed as resynchronizarion.

When BAUD[RESYNCDIS] is 0, you perform this falling edge detection and resynchronization not only for the start bit but also for the rest of the character reception after the start bit.

When BAUD[RESYNCDIS] is 1, you perform the falling edge detection and resynchronization only for the start bit. The use case for disabling the resynchronization is protocols that require this (for example, LIN 2.1 prohibits resynchronization within a byte).

The following table and figure explain LPUART resynchronization.

Table 682. LPUART resynchronization settings

Resynchronization	BAUD[RESYNCDIS] = 0	BAUD[RESYNCDIS] = 1
For the starting bit falling edge	Yes	Yes
For all falling edges after the start bit	Yes	No

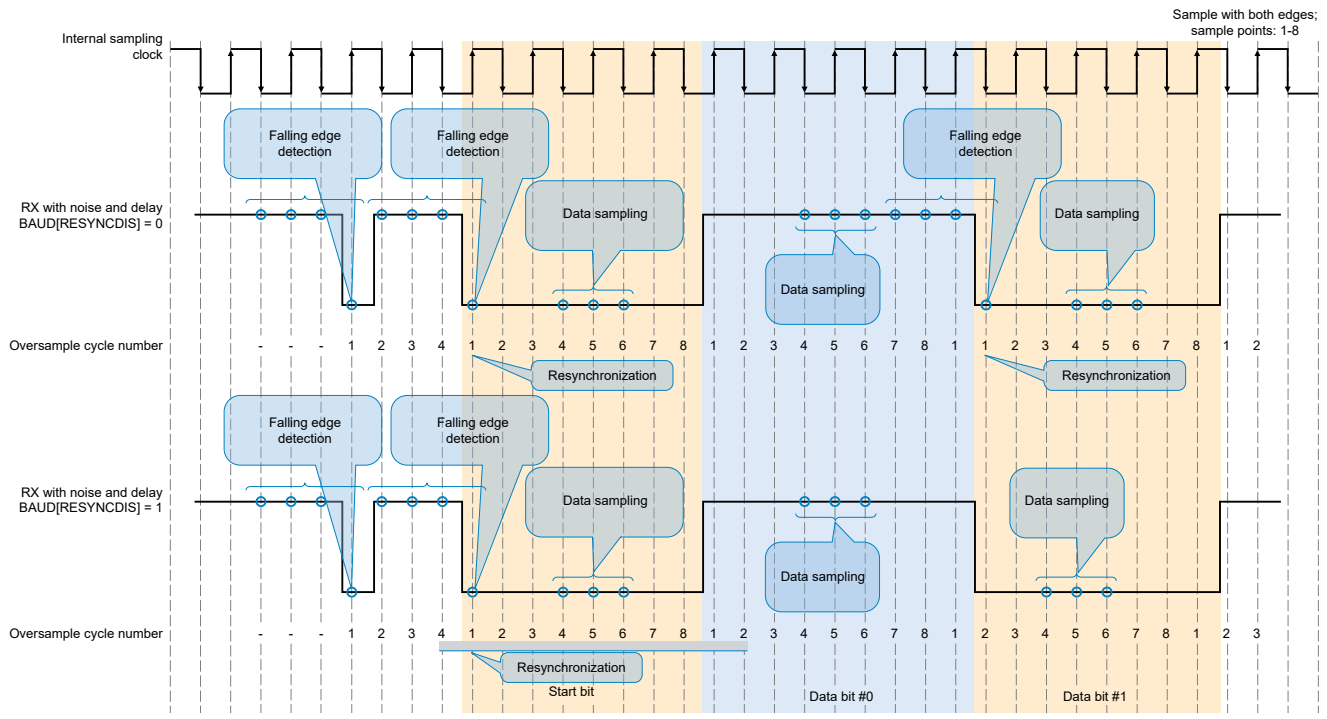

Figure 597. LPUART resynchronization diagram

79.3.5.2 Receiver wake-up operation

Receiver wake-up and receiver address matching are hardware mechanisms that allow an LPUART receiver to ignore the characters in a message intended for a different receiver.

During receiver wake-up, all receivers evaluate the first character(s) of each message, and as soon as they determine the message is intended for a different receiver, they write 1 to CTRL[RWU].

When CTRL[RWU] and STAT[RWUID] are 1, the status fields associated with the receiver, with the exception of STAT[IDLE], are inhibited from becoming 1, thus eliminating the software overhead for handling the unimportant message characters. At the end of a message, all receivers automatically force CTRL[RWU] to become 0. This results in all receivers waking up in time to look at the first character(s) of the next message.

During receiver address matching, the address matching is performed in hardware and the LPUART receiver ignores all characters that do not meet the address match requirements.

Table 683. Receiver wake-up options

CTRL[RWU]	BAUD[MAEN1] | BAUD[MAEN2]	BAUD[MATCFG]	CTRL[WAKE]: STAT[RWUID]	Receiver wake-up
0	0	X	X	Normal operation
1	0	00	00	Receiver wake-up on idle line; STAT[IDLE] = 0
1	0	00	01	Receiver wake-up on idle line; STAT[IDLE] = 1
1	0	00	10	Receiver wake-up on address mark
1	1	11	10	Receiver wake-up on data match
0	1	00	X0	Address mark address match; STAT[IDLE] = 0 for discarded characters
0	1	00	X1	Address mark address match; STAT[IDLE] = 1 for discarded characters
0	1	01	X0	Idle line address match
0	1	10	X0	Match on and match off; STAT[IDLE] = 0 for discarded characters
0	1	10	X1	Match on and match off; STAT[IDLE] = 1 for discarded characters

79.3.5.2.1 Idle line wake-up

When CTRL[WAKE] is 0, you can configure the receiver for an idle line wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a full character time of the idle-line level.

CTRL[M], CTRL[M7], and BAUD[M10] select 7-bit to 10-bit Data mode and BAUD[SBNS] selects a 1-bit or 2-bit stop bit number that determines how many bit times of idle are needed to constitute a full character time, 9 to 13 bit times because of the start and stop bits.

When CTRL[RWU] is 1 and STAT[RWUID] is 0, the idle condition that wakes up the receiver does not lead to STAT[IDLE] becoming 1. The receiver wakes up and waits for the first data character of the next message that leads to STAT[RDRF] becoming 1 and generates an interrupt if enabled. When STAT[RWUID] is 1, any idle condition leads to STAT[IDLE] becoming 1 and generates an interrupt if enabled, regardless of whether CTRL[RWU] is 0 or 1.

These are the ways to detect an idle line:

- When CTRL[ILT] is 0, the idle bit counter starts after the start bit so that the stop bit and any logic 1s at the end of a character count to calculate the full character time of idle.
- When CTRL[ILT] is 1, the idle bit counter does not start until after the stop bit time so that the data in the last character of the previous message does not impact the idle detection.

79.3.5.2.2 Address mark wake-up

When CTRL[WAKE] is 1, you can configure the receiver for an address mark wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a logic 1 in the most significant bit of the received character. When parity is enabled, the second most significant bit is used for address mark wake-up.

Address mark wake-up allows messages to contain idle characters, but requires one bit to be reserved for use in address frames. The logic 1 in the most significant bit (or second most significant bit when parity is enabled) of an address frame writes 0 to CTRL[RWU] and writes 1 to STAT[RDRF]. In this case, the character with the address mark bit is received even if the receiver is sleeping during most of this character time.

79.3.5.2.3 Data match wake-up

When CTRL[RWU] and CTRL[WAKE] are 1, and BAUD[MATCFG] equals 11, the receiver is configured for a data match wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a character that matches MATCH[MA1] when BAUD[MAEN1] is 1, or that matches MATCH[MA2] when BAUD[MAEN2] is 1.

79.3.5.2.4 Address match operation

You can enable the address match operation when either BAUD[MAEN1] or BAUD[MAEN2] is 1 and BAUD[MATCFG] is 0. In this function, a character that the RXD pin receives with a logic 1 in the most significant bit (or the second most significant bit when parity is enabled) is considered an address and is compared to the associated MATCH[MA1] or MATCH[MA2]. The character is only transferred to the receive buffer, and STAT[RDRF] becomes 1 if the comparison matches. All subsequent characters received with a logic 0 in the most significant bit (or the second most significant bit when parity is enabled) are considered to be data associated with the address and are transferred to the receive FIFO. If no marked address match occurs, no transfer is made to the receive FIFO, and all the characters that follow, with logic 0 in the most significant bit (or second most significant bit when parity is enabled), are also discarded. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

The address match operation functions in the same way for both MATCH[MA1] and MATCH[MA2]:

- If either BAUD[MAEN1] or BAUD[MAEN2] is 1, a marked address is compared only to the associated Match Address (MATCH) and data is transferred to the receive FIFO only on a match.
- If both BAUD[MAEN1] and BAUD[MAEN2] are 1, a marked address is compared to both MATCH[MA1] and MATCH[MA2] and data is transferred only on a match with either of these fields.

79.3.5.2.5 Idle match operation

You can enable the idle match operation when either BAUD[MAEN1] or BAUD[MAEN2] is 1 and BAUD[MATCFG] is 1. In this function, the first character that the RXD pin receives after an idle line condition is considered an address and is compared to the associated MATCH[MA1] or MATCH[MA2]. The character is transferred only to the receive buffer, and STAT[RDRF] becomes 1, if the comparison matches. All subsequent characters are considered to be data associated with the address and are transferred to the receive FIFO until the next idle line condition is detected. If no address match occurs, no transfer is made to the receive FIFO, and all the frames that follow, until the next idle condition, are also discarded. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

An idle match operation functions in the same way for both MATCH[MA1] and MATCH[MA2]:

- If either BAUD[MAEN1] or BAUD[MAEN2] is 1, the first character after an idle line is compared only to the associated Data (DATA) and data is transferred to the receive FIFO only on a match.

- If both BAUD[MAEN1] and BAUD[MAEN2] are 1, the first character after an idle line is compared to both MATCH[MA1] and MATCH[MA2] and data is transferred only on a match with either of these fields.

79.3.5.2.6 Match on, match off operation

The match on, match off operation is enabled when both BAUD[MAEN1] and BAUD[MAEN2] are 1 and BAUD[MATCFG] = 10. In this function, a character that the RXD pin receives matches MATCH[MA1] and is transferred to the receive buffer, and STAT[RDRF] becomes 1. All subsequent characters are considered to be data and are also transferred to the receive FIFO, until a character that matches MATCH[MA2] is received. The character that matches MATCH[MA2], along with all subsequent characters, is discarded; and this continues until another character that matches MATCH[MA1] is received. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

NOTE

The match on, match off operation requires both BAUD[MAEN1] and BAUD[MAEN2] to be 1.

79.3.5.3 Hardware flow control

To support hardware flow control, you can program the receiver to automatically assert and deassert RTS_B:

- RTS_B remains asserted until the transfer is complete, even if the transmitter is disabled midway through a data transfer. See Transceiver driver enable using RTS_B for more information.
- If the receiver RTS functionality is enabled, the receiver automatically deasserts RTS_B if STAT[RDRF] is 1 or a start bit is detected that causes STAT[RDRF] to become 1.
- The receiver asserts RTS_B when STAT[RDRF] is 0 and has not detected a start bit that causes STAT[RDRF] to become 1. There is no impact if STAT[RDRF] is 1 already.
- Even if RTS_B is deasserted, the receiver continues to receive characters until the receive FIFO is overrun.
- If the receiver RTS functionality is disabled, the receiver's RTS_B remains deasserted.

79.3.6 Additional LPUART functions

79.3.6.1 Data modes

You can configure the LPUART transmitter and receiver to operate in 7-bit Data mode by writing 1 to CTRL[M7], 9-bit Data mode by writing 1 to CTRL[M], or 10-bit Data mode by writing 1 to BAUD[M10]. In 9-bit Data mode, there exists a ninth data bit and in 10-bit mode, there exists a tenth data bit.

When performing 8-bit writes to the transmit FIFO, the ninth and tenth bits are pushed into the FIFO from CTRL[T8] and CTRL[T9]. For coherent 8-bit writes, you must write to CTRL[T8] and CTRL[T9] before writing to Data (DATA)[7:0]. However, if the values in CTRL[T8] or CTRL[T9] do not need to change, it is not necessary to update CTRL[T8] and CTRL[T9] before every 8-bit write to Data (DATA).

When performing 16-bit or 32-bit writes to the transmit FIFO, all 10 bits are pushed into the transmit FIFO from the write data.

When performing 8-bit reads of the receive FIFO, the ninth and tenth bits are held in CTRL[R8] and CTRL[R9] but you must read them before reading Data (DATA). A 16-bit or 32-bit read of the receive FIFO returns all 10 bits in Data (DATA).

The 9-bit Data mode is typically used with parity to allow eight bits of data plus the parity in the ninth bit, or it is used with the address mark wake-up so that the ninth data bit can serve as the wake-up bit. The 10-bit Data mode is typically used with parity and address mark wake-up so that the ninth data bit can serve as the wake-up bit and the tenth bit can serve as the parity bit. In custom protocols, the ninth and/or tenth bits can also serve as software-controlled markers.

79.3.6.2 Idle length

An idle character is one where the start bit, all data bits, and stop bits are in the mark position (idle state, generally logic 1). You can configure CTRL[ILT] to start detecting an idle character from the previous start bit (any data bits and stop bits count for idle character detection) or from the previous stop bit.

You can also use CTRL[IDLECFG] to configure the number of idle characters that must be received before an idle line condition is detected. This field configures the number of idle characters that must be received before STAT[IDLE] becomes 1, STAT[RAF] becomes 0, and DATA[IDLINE] becomes 1 with the next received character.

CTRL[IDLECFG] also affects the idle line wake-up and idle match operations. When either the address match or match on/off operation is enabled, writing 1 to STAT[RWUID] causes any discarded characters to be treated as idle characters.

After the extended idle time is enabled for the receiver, you can configure an idle line condition by using REIR[IDTIME], which specifies the number of bits (baud rate) since the last stop bit that is required for an idle condition to be detected. This replaces the configuration of CTRL[ILT] and CTRL[IDLECFG].

The transmitter can also enable the extended idle time. In this case, any idle character queued through the transmit FIFO forces the transmitter to be idled for the configured number of bit clocks before the idle character is read from the FIFO and the transmitter continues.

After you enable the transmitter extended idle time, the transmitter does not automatically queue an idle character whenever it is enabled.

79.3.6.3 Loop mode

Enable Loop mode by setting CTRL[LOOPS] = 1 and CTRL[RSRC] = 0. You, sometimes, use Loop mode to check software, independent of connections in the external system, to help isolate system problems. In this mode, the transmitter output is internally connected to the receiver input and LPUART does not use the RXD pin.

Loop mode also internally connects the RTS_B output to the CTS_B input and the DTR_B output to the DSR_B input.

79.3.6.4 Single-Wire mode

Enable Single-Wire mode by setting CTRL[LOOPS] = 1 and CTRL[RSRC] = 1. Single-Wire mode implements a half-duplex serial connection. The receiver is internally connected to the transmitter output and TXD pin (the RXD pin is not used).

In Single-Wire mode, CTRL[TXDIR] controls the direction of serial data on the TXD pin. When CTRL[TXDIR] becomes 0, the TXD pin is an input to the receiver and the transmitter is temporarily disconnected from the TXD pin so that an external device can send serial data to the receiver. When CTRL[TXDIR] = 1, the TXD pin is an output that the transmitter drives. The internal loop back connection is disabled, and as a result, the receiver is unable to receive characters that the transmitter sends out.

Half Duplex Control (HDCR) replaces the implementation of CTRL[LOOPS] and CTRL[RSRC], and you can use this register to configure various options for both Single-Wire and Half-Duplex operations, using independent RXD and TXD pins:

- HDCR[TXSTALL] replaces the CTRL[TXDIR] functionality and prevents the transmitter from becoming busy or asserting the RTS_B transmitter if STAT[RAF] is 1.
- You can select the TXD pin, as the source for the receiver, to configure HDCR[RXSEL] for a single-wire operation. If HDCR[RXSEL] is 1, you must configure the TXD pin for an open-drain operation.
- HDCR[RXMSK] masks the receiver input when the RTS_B transmitter is asserted (this applies even if you have not configured RTS_B as an output).
- HDCR[RXWRMSK] blocks storage of the receive data in the receive FIFO when the RTS_B transmitter is asserted. This setting does not affect the receiver idle functionality.
- HDCR[RTSEXT] delays the negation of the RTS_B transmitter by the configured number of bit clocks (baud rate).

79.3.6.5 Timeout counter

LPUART implements four general-purpose timeout counters; counters 0 and 1 are used to monitor the receiver and counters 2 and 3 are used to monitor the transmitter. When enabled, you can configure each counter to monitor one of the following conditions:

- Idle time in number of bits, starting to increment when first enabled and an idle condition is detected. The counter restarts whenever a character is received or transmitted.
- Idle time in number of bits, starting to increment after the next character is received or transmitted. The counter restarts whenever a character is received or transmitted.

- Idle time is more than the timeout interval, in number of bits, but less than the extended idle timeout. The counter restarts whenever a character is received or transmitted. You can use this to detect a gap between characters that is greater than a threshold (timeout) but less than the configured extended idle time. This configuration requires the extended idle feature for the transmitter or receiver to be enabled for a proper operation.
- Number of characters received or transmitted is equal to the configured timeout. The counter asserts at the start of the character that equals the timeout value.

The timeout counters restart counting whenever the counter is disabled and then enabled. These timeout counters are disabled when the corresponding STAT[TSF] field is 1. If the timeout enable is still set after STAT[TSF] becomes 0, the timeout counter restarts as if the counter had been disabled and then enabled. You can measure the idle time in bit times from the end of the last stop bit and until a start bit is validated.

79.3.7 Peripheral triggers

The connection of the LPUART peripheral triggers with other peripherals is chip-specific.

79.3.7.1 Output triggers

LPUART generates the following output triggers that can be connected to other peripherals on the chip:

- The transmit word trigger asserts at the end of each transmitted word and negates after 1-bit period.
- The transmit data trigger is identical to the TXD pin output, but without support for input trigger modulation.
- The receive word trigger asserts at the end of each received word that is written to the receive FIFO, for one oversampling clock period.
- The receive idle trigger asserts when STAT[IDLE] becomes 1, and negates when the next valid start bit is detected.

79.3.7.2 Input trigger

LPUART supports a peripheral input trigger that you can configure in one of the following ways:

- By enabling the CTS function: You can connect the input trigger instead of the CTS_B pin input. The input trigger must assert for longer than 1-bit clock period when the transmitter is idle, with data to send, to guarantee a new transmission.
- By making the input trigger modulate the transmit data output (trigger is logically ANDed with the TXD output): The input trigger is expected to be a free-running clock (carrier signal) that generates from a timer or PWM source with a frequency that is greater than the bit-clock frequency. The carrier signal must not toggle faster than the maximum supported bit time.
- By connecting the input trigger instead of the RXD pin input: The input trigger is expected to be generated from a receive data source, such as an analog comparator or external pin.

79.3.8 Infrared (IR) interface

LPUART provides the capability of transmitting narrow pulses to an IR LED and receiving narrow pulses, transforming them to serial bits, which are then sent to LPUART. The IrDA physical layer specification defines a half-duplex IR communication link for exchanging data. The full standard includes data rates up to 16 Mbit/s. The LPUART IrDA support is limited to SIR mode that supports data rates only between 2.4 kbit/s and 115.2 kbit/s.

LPUART has an infrared transmit encoder and a receive decoder. The infrared decoder converts the received character from the IrDA format to the NRZ format, which the receiver uses. It also has an OSR oversampling baud rate clock counter that filters noise and indicates when a 1 is received. LPUART transmits serial bits of data, which the infrared submodule encodes, to transmit a narrow pulse for every zero bit. No pulse is transmitted for every single bit. When receiving data, an IR photo diode (external to LPUART) detects the IR pulses. The IR receive decoder transforms them to CMOS levels. The infrared receive decoder then stretches the narrow pulses to get back to a serial bit stream that LPUART receives. You can invert the polarity of transmitted pulses and expected receive pulses so that a direct connection can be made to external IrDA transceiver modules that use active-high pulses.

The IR submodule receives its clock sources from LPUART. The submodule selects one of these clocks to generate either 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR narrow pulses during transmission.

79.3.8.1 Infrared transmit encoder

The infrared transmit encoder converts serial bits of data from the transmit shift register to the TXD signal. A narrow pulse is transmitted for a 0 bit and no pulse is transmitted for a 1 bit. The narrow pulse is sent at the start of the bit with a duration of 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR of a bit time. A narrow low pulse is transmitted for a 0 bit when CTRL[TXINV] is 0, while a narrow high pulse is transmitted for a 0 bit when CTRL[TXINV] is 1.

79.3.8.2 Infrared receive decoder

The infrared receive block converts data from the RXD signal to the receive shift register. A narrow pulse is expected for each 0 received and no pulse is expected for each 1 received. A narrow low pulse is expected for a 0 bit when STAT[RXINV] is 0, while a narrow high pulse is expected for a 0 bit when STAT[RXINV] is 1. This receive decoder meets the edge jitter requirement as defined by the IrDA serial infrared physical layer specification.

79.3.8.3 Start-bit detection

When STAT[RXINV] is 0, the first falling edge of the received character corresponds to the start bit. The infrared decoder resets its counter. At this time, the receiver also begins its start bit detection process. After the start bit is detected, the receiver synchronizes its bit times to this start bit time. For the rest of the character reception, the infrared decoder's counter and the receiver's bit time counter count independently of each other.

79.3.8.4 Noise filtering

The decoder ignores any rising edges detected during the first half of the infrared decoder counter, and can leave any pulses less than one oversampling baud clock as undetected. This is regardless of whether the pulse is seen in the first or second half of the count.

79.3.8.5 Low-bit detection

During the second half of the decoder count, a rising edge is decoded as 0, which is sent to the receiver. The decoder counter is also reset.

79.3.8.6 High-bit detection

At OSR oversampling baud rate clocks after the previous rising edge, if a rising edge is not seen, the decoder sends a 1 to the receiver.

If the next bit is 0, which arrives late, a low bit is detected according to Low-bit detection. The value sent to the receiver is changed from 1 to 0. Then, if a noise pulse occurs outside the receiver's bit time sampling period, the delay of a 0 is not recorded as noise.

79.3.9 MODBUS protocol

79.3.9.1 MODBUS frame structure

MODBUS is an application layer messaging protocol, positioned at level 7 of the OSI model. It provides client and server communication between devices connected on different types of buses or networks.

The MODBUS protocol defines a simple protocol data unit (PDU) independent of the underlying communication layers. The mapping of the MODBUS protocol on specific buses or network can introduce some additional fields on the application data unit (ADU).

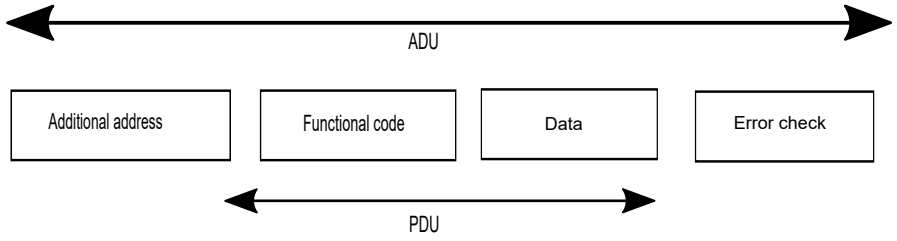

Figure 598. MODBUS frame structure

The function code field informs the server about which action to perform, as requested by the client (only the client can initiate the communication), where the data field contains additional information that the server uses to take the action defined by the function code. MODBUS PDU for serial line communication = 256 - server address (1 byte) - CRC (2 bytes) = 253 bytes.

You can set up a MODBUS controller to communicate on standard MODBUS networks using either of the two transmission modes: ASCII or RTU. RTU mode allows better character density and throughput for the same baud rate as the ASCII format allows 7 bits to represent a character where RTU keeps 8 bits for data representation in each packet.

79.3.9.2 MODBUS frame for LPUART

Though the protocol resides in the application layer, it can also be checked at the physical layer using LPUART by considering the frame structure shown in the following figure, following RTU mode of data transmission.

Start	Address	Function	Data	CRC	End
3.5 Char time	8 Bit	8 Bit	N * 8Bit	16 Bit	3.5 Char time

Figure 599. MODBUS frame for LPUART

An entire message frame of MODBUS must contain start character, address, function code, data, and end character. LPUART does not support CRC calculation for TX and RX, instead, each LPUART packet containing frame information is transmitted with its individual parity, and the same is checked in RX. Following the last transmitted character, a similar interval of at least 3.5 character times marks the end of the message and a new message can begin after this interval. The entire message frame must be transmitted as a continuous stream. If a silent interval of more than 1.5 character times occurs before the completion of the frame, the receiving device flushes the incomplete message, and assumes that the next byte is the address field of a new message. The correctness of timeout logic ensures the correctness of the MODBUS frame using LPUART.

Registers such as REIR, TEIR, TOCR, TOSR, TIMEOUT[0 - 3], TCBR, and TDBR are useful for realizing MODBUS using LPUART. The TX IDLE time is configured by using TEIR[IDTIME].

For higher baud rates, MODBUS recommends adopting fixed t1.5 and t3.5 times of 750us ms and 1.75 ms. The receiver idle line wake-up can be used by a MODBUS device to only wake-up on a matching address or broadcast address received after a valid idle time. The receiver end-of-packet DMA transfer can be used to offload the reception of a MODBUS packet onto the DMA controller.

79.3.9.3 MODBUS TX and RX programming sequence

The following programming sequences can be useful for sending and receiving MODBUS frames using LPUART.

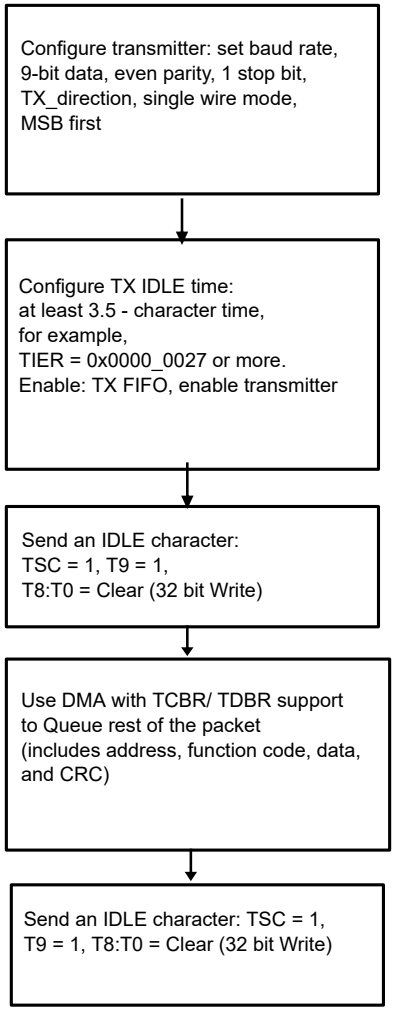

Figure 600. MODBUS TX programming

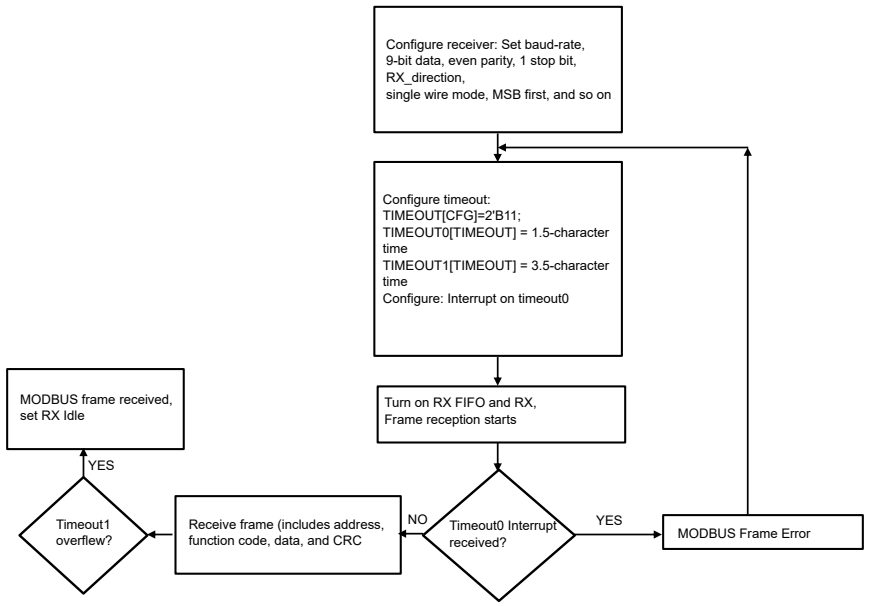

Figure 601. MODBUS RX programming

79.3.10 Modes of operation

79.3.10.1 Low-Power modes

LPUART remains functional during low-power modes, provided CTRL[DOZEEN] is 0 and the LPUART functional clock is enabled. LPUART can generate an interrupt or DMA request to cause a wake-up from low-power modes.

You can configure LPUART to be disabled in low-power modes, when CTRL[DOZEEN] is 1. In this case, the transmitter and receiver finish transmitting and receiving the current word.

If LPUART is disabled in low-power modes, it can generate a wake-up via STAT[RXEDGIF] if the receiver detects an active edge.

NOTE

See the chip-specific information for specific low-power modes available on your chip.

79.3.10.2 Debug mode

LPUART remains functional in Debug mode.

79.3.11 Clocking

Table 684. Types of clocks

Clock	Description
Functional	Is asynchronous to the bus clock and can remain enabled in Low-Power modes to support transmit and/or receive functions, including low-power wake-up.
Bus	Is only used for bus accesses to the control and configuration registers. The bus clock frequency must be sufficient to support the data bandwidth requirements of the LPUART transmit and receive registers, including the FIFOs.

79.3.12 Reset

Table 685. Types of resets

Reset	Description
Chip	Enables the logic and registers for the LPUART transmitter and receiver to reset to their default states.
Software	Resets the LPUART logic and registers to their default states, except for Global (GLOBAL). GLOBAL[RST] controls the LPUART software reset.
FIFO	Implements write-only control fields that reset the transmit FIFO (FIFO[TXFLUSH]) and receive FIFO (FIFO[RXFLUSH]). After a FIFO is reset, that FIFO becomes empty.

79.3.13 Interrupts

The LPUART transmitter has two status fields that can optionally generate hardware interrupt requests. If STAT[TDRE] is 1, it indicates that there is room in the transmit FIFO to write another transmit character to Data (DATA). If CTRL[TIE] is 1, a hardware interrupt is requested when STAT[TDRE] is 1.

STAT[TC] indicates that the transmitter is finished transmitting all data, preamble, and break characters and is idle with TXD at the inactive level. This field is often used in systems with modems to determine when it is safe to turn off the modem. If CTRL[TCIE] is 1, a hardware interrupt is requested when STAT[TC] is 1. Instead of hardware interrupts, software polling may be used to monitor STAT[TDRE] and STAT[TC] if the corresponding CTRL[TIE] or CTRL[TCIE] field is 0.

When a program detects that STAT[RDRF] is 1, it gets the data from this field by reading Data (DATA). The field becomes 0 by reading Data (DATA).

STAT[IDLE] includes logic that prevents it from becoming 1 repeatedly when the RXD line remains idle for an extended period of time. STAT[IDLE] becomes 0 when you write 1 to it, and cannot become 1 again until the receiver has received at least one new character and has 1 as the value of STAT[RDRF].

If the associated error is detected in the received character that caused STAT[RDRF] to become 1, STAT[NF], STAT[FE], and STAT[PF] become 1 at the same time STAT[RDRF] becomes 1. These flags do not become 1 in overrun cases.

If STAT[RDRF] is already 1 when a new character is ready to be transferred from the receive shifter to the receive FIFO, STAT[OR] becomes 1, instead of the data along with any associated STAT[NF], STAT[FE], or STAT[PF] condition getting lost.

If the received character matches the contents of MATCH[MA1] and/or MATCH[MA2], then STAT[MA1F] and/or STAT[MA2F] become 1 at the same time that STAT[RDRF] becomes 1.

At any time, an active edge on the RXD serial data input pin causes STAT[RXEDGIF] to become 1. STAT[RXEDGIF] becomes 0 when you write 1 to it. This function depends on the receiver being enabled (the value of CTRL[RE] being 1).

MODEM Status (MSR) can generate an interrupt from a configured status field, which STAT[MSF] indicates.

Timeout Status (TOSR) can generate an interrupt from a configured status field, which STAT[TSF] indicates.

79.3.14 DMA

79.3.14.1 DMA burst support

To support efficient DMA transfers to the transmit FIFO, two alias regions are implemented to support incrementing 8-bit, 16-bit, or 32-bit write accesses to the transmit FIFO:

- Transmit Command Burst (TCBR0 - TCBR127) is a 512-byte region that supports pushing 16-bit data into the transmit FIFO.
- Transmit Data Burst (TDBR0 - TDBR255) is a 1024-byte region that supports pushing zero extended 8-bit data into the transmit FIFO.

The aforementioned regions are contiguous, so a DMA transfer can start in Transmit Command Burst (TCBR0 - TCBR127) to initialize the transfer including address mark, idle word, or break character, and then complete the transfer in Transmit Data Burst (TDBR0 - TDBR255) with the data to transmit, without changing the transfer size.

The transmit FIFO block writes overflow the FIFO, but that does not signal an error. Do not perform 32-bit writes to Transmit Data Burst (TDBR0 - TDBR255) unless there are four empty slots in the transmit FIFO, and do not perform 16-bit writes to this register unless there are two empty slots in the transmit FIFO.

79.4 External signals

Table 686. External signals

Signal	Description	I/O
TXD	Transmit data: This pin is normally an output, but is an input (tristated) in Single-Wire mode whenever the transmitter is disabled or the transmit direction is configured for receive data.	I/O
RXD	Receive data	I
CTS_B	Clear-to-send	I
RTS_B	Request-to-send	O
DTR_B	Data terminal ready	O
DSR_B	Data set ready	I
DCD_B	Data carrier detect	I
RIN_B	Ring indicator	I

79.5 Initialization

This module does not require initialization.

79.6 Register definition

LPUART includes registers to control baud rate, select options, report status, and store transmit and receive data. Access to an address outside the valid memory map generates a bus error.

NOTE

Writing to a read-only (RO) register or reading a write-only (WO) register can cause bus errors. LPUART does not verify whether programmed values in the registers are correct; you must write valid values to them.

79.6.1 LPUART register descriptions

79.6.1.1 LPUART memory map

LPUART_0 base address: 4032_8000h

LPUART_1 base address: 4032_C000h

15-8 RXFIFO	Receive FIFO Size Indicates the number of characters in the receive FIFO, which is 2^RXFIFO.
7-0 TXFIFO	Transmit FIFO Size Indicates the number of characters in the transmit FIFO, which is 2^TXFIFO.

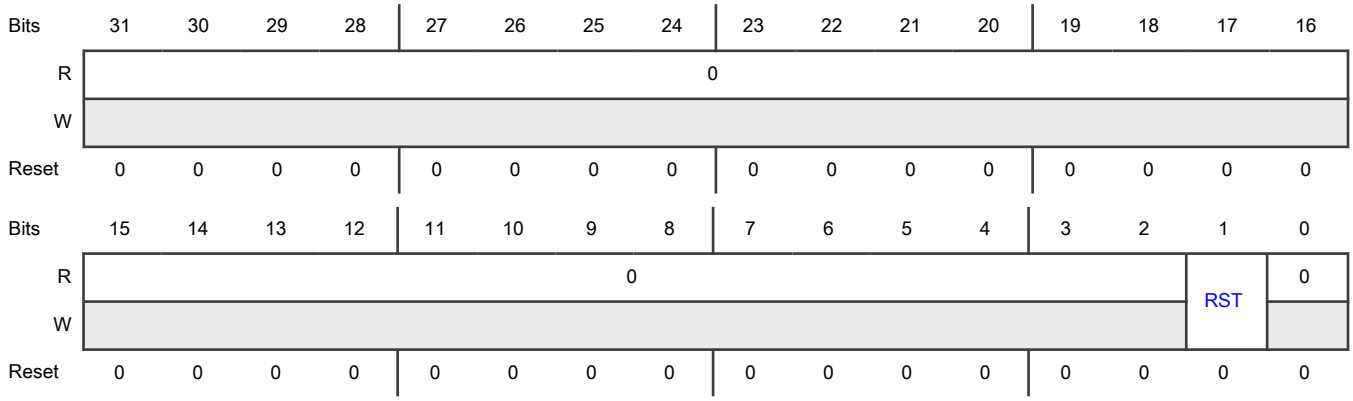
79.6.1.4 Global (GLOBAL)

Offset

Register	Offset
GLOBAL	8h

Function
Performs global functions.

Diagram



Fields

Field	Function
31-2 —	Reserved
1 RST	Software Reset Specifies whether the module is reset. This field resets all internal logic and registers, except Global (GLOBAL). The reset takes effect immediately and remains asserted until you negate it. There is no minimum delay required before clearing the software reset. 0b - Not reset 1b - Reset
0 —	Reserved

79.6.1.5 Pin Configuration (PINCFG)

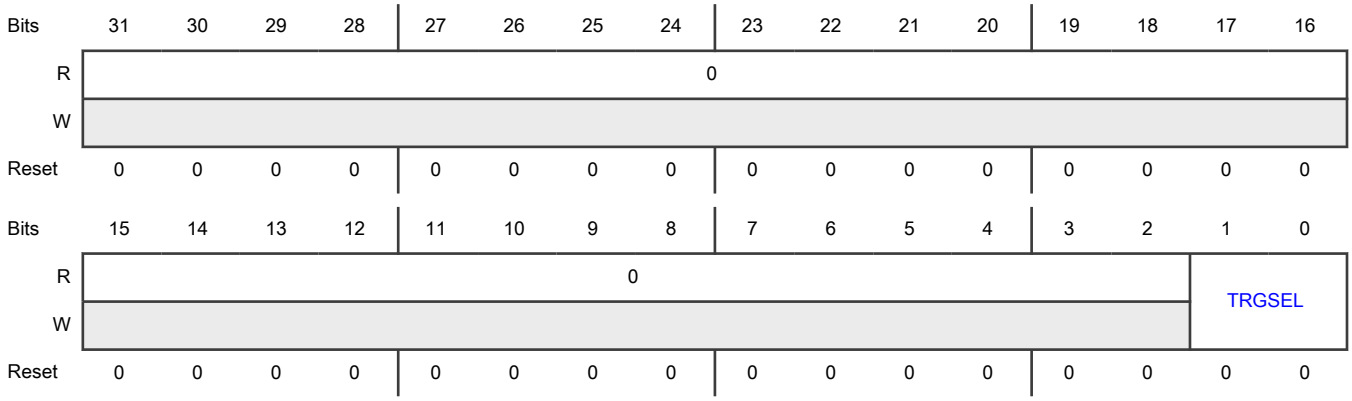
Offset

Register	Offset
PINCFG	Ch

Function

Enables the selection of input pins.

Diagram



Fields

Field	Function
31-2 —	Reserved
1-0 TRGSEL	Trigger Select Configures the input trigger usage. You must change the value of this field only when both the transmitter and receiver are disabled. 00b - Input trigger disabled 01b - Input trigger used instead of the RXD pin input 10b - Input trigger used instead of the CTS_B pin input 11b - Input trigger used to modulate the TXD pin output, which (after TXINV configuration) is internally ANDed with the input trigger

79.6.1.6 Baud Rate (BAUD)

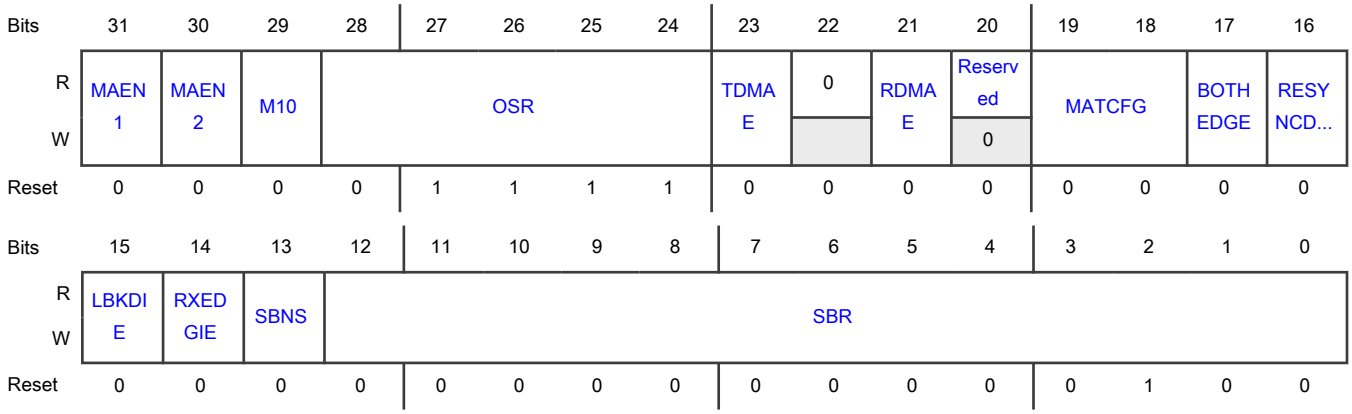
Offset

Register	Offset
BAUD	10h

Function

Configures the baud rate.

Diagram



Fields

Field	Function
31 MAEN1	Match Address Mode Enable 1 Enables automatic address matching or data matching mode for MATCH[MA1]. If this field is 0, normal operation takes place. 0b - Disable 1b - Enable
30 MAEN2	Match Address Mode Enable 2 Enables automatic address matching or data matching mode for MATCH[MA2]. If this field is 0, normal operation takes place. 0b - Disable 1b - Enable
29 M10	10-Bit Mode Select Causes the tenth bit to be a part of the serial transmission. You must change the value of this field only when both the transmitter and receiver are disabled. 0b - Receiver and transmitter use 7-bit to 9-bit data characters 1b - Receiver and transmitter use 10-bit data characters
28-24 OSR	Oversampling Ratio Configures the OSR of the receiver. You must change the value of this field only when both the transmitter and receiver are disabled. **NOTE** BAUD[OSR] results in an OSR of BAUD[OSR] + 1, for example, BAUD[OSR] = 0_0101b results in a final division by 6. 0_0000b - Results in an OSR of 16

Table continues on the next page...

23 TDMAE	Transmitter DMA Enable Enables STAT[TDRE] to generate a DMA request.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disable 1b - Enable
22 —	Reserved
21 RDMAE	Receiver Full DMA Enable Enables STAT[RDRF] to generate a DMA request. 0b - Disable 1b - Enable
20 —	Reserved
19-18 MATCFG	Match Configuration Configures the match addressing mode used. You must change the value of this field only when both the transmitter and receiver are disabled. 00b - Address match wake-up 01b - Idle match wake-up 10b - Match on and match off 11b - Enables RWU on data match and match on or off for the transmitter CTS input
17 BOTHEDGE	Both Edge Sampling Enables sampling of the received data on both edges of the baud rate clock, effectively doubling the number of times the receiver samples the input data for a given OSR. This field must be 1 for OSRs between x4 and x7 and is optional for higher OSRs. You must change the value of this field only when the receiver is disabled. If this field is 0, the receiver samples input data using the rising edge of the baud rate clock. If this field is 1, the receiver samples input data using the rising and falling edges of the baud rate clock. 0b - Rising edge 1b - Both rising and falling edges
16 RESYNCDIS	Resynchronization Disable Disables resynchronization of the received data word when a data one followed by data zero transition is detected. You must change the value of this field only when the receiver is disabled. 0b - Enable 1b - Disable
15	LIN Break Detect Interrupt Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
LBKDIE	Enables STAT[LBKDIF] to generate hardware interrupt requests. If this field is 0, hardware interrupts from STAT[LBKDIF] (uses polling) are disabled. If this field is 1, hardware interrupts are requested when STAT[LBKDIF] is 1. 0b - Disable 1b - Enable
14 RXEDGIE	RX Input Active Edge Interrupt Enable Enables STAT[RXEDGIF] to generate interrupt requests. If this field is 0, hardware interrupts from STAT[RXEDGIF] are disabled. If this field is 1, hardware interrupts are requested when STAT[RXEDGIF] is 1. Changing the value of CTRL[LOOPS] or CTRL[RSRC] when this field (RXEDGIE) is 1 can cause STAT[RXEDGIF] to become 1. 0b - Disable 1b - Enable
13 SBNS	Stop Bit Number Select Determines whether data characters include one or two stop bits. You must change the value of this field only when both the transmitter and receiver are disabled. 0b - One stop bit 1b - Two stop bits
12-0 SBR	Baud Rate Modulo Divisor Sets the modulo divide rate for the baud rate generator. • If SBR is 0, baud rate generator is disabled. • If SBR is 1–8191, baud rate = baud clock ÷ ((OSR + 1) × SBR). You must update the 13-bit baud rate setting [SBR12:SBR0] only when both the transmitter and receiver are disabled (both CTRL[RE] and CTRL[TE] are 0).

79.6.1.7 Status (STAT)

Offset

Register	Offset
STAT	14h

Function
Provides the module status.

Fields

Field	Function
31 LBKDIF	LIN Break Detect Interrupt Flag Indicates whether a LIN break character is detected. This field becomes 1 when the LIN break detect circuitry is enabled and a LIN break character is detected. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Not detected 1b - Detected When writing 0b - No effect 1b - Clear the flag
30 RXEDGIF	RXD Pin Active Edge Interrupt Flag Indicates whether an active edge on the receive pin has occurred. This field becomes 1 whenever the receiver is enabled and an active edge (falling if STAT[RXINV] is 0; rising if STAT[RXINV] is 1) on the RXD pin occurs. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Not occurred 1b - Occurred When writing 0b - No effect

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Clear the flag
29 MSBF	MSB First Specifies the first bit that is transmitted after the start bit. If this field is 0, LSB (bit 0) is the first bit transmitted after the start bit (which means, the first bit received after the start bit is identified as bit 0). If this field is 1, MSB (identified as bit 9, bit 8, bit 7, or bit 6) is the first bit that is transmitted, after the start bit, depending on the settings of CTRL[M], CTRL[PE], and BAUD[M10]. Writing 1 to this field reverses the order of the bits that are transmitted and received on the wire. This field does not affect the polarity of the bits, the location of the parity bit, or the location of the start or stop bits. You must change the value of this field only when both the transmitter and receiver are disabled. 0b - LSB 1b - MSB
28 RXINV	Receive Data Inversion Specifies whether receive data is inverted. Writing 1 to this field reverses the polarity of the received data input. You must change the value of this field only when the receiver is disabled. **NOTE** Writing 1 to this field inverts the RXD input for all cases: data bits, start and stop bits, break, and idle. 0b - Inverted 1b - Not inverted
27 RWUID	Receive Wake Up Idle Detect Controls, for CTRL[RWU] on idle character detection, whether the idle character that wakes up the receiver writes 1 to STAT[IDLE]. For address match wake-up, this field controls whether STAT[IDLE] = 1 when the address does not match. You must change the value of this field only when the receiver is disabled. If this field is 0, during the Receive Standby state (CTRL[RWU] = 1), STAT[IDLE] does not become 1 upon detection of an idle character. During address match wake-up, STAT[IDLE] does not become 1 when an address does not match. If this field is 1, during the Receive Standby state (CTRL[RWU] = 1), STAT[IDLE] becomes 1 upon detection of an idle character. During address match wake-up, STAT[IDLE] becomes 1 when an address does not match. 0b - STAT[IDLE] does not become 1 1b - STAT[IDLE] becomes 1
26 BRK13	Break Character Generation Length Selects the longer transmitted break character length.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	The state of this field does not affect the detection of a framing error. You must change the value of this field only when the transmitter is disabled. You can send a break character by writing 1 to CTRL[SBK], or by writing the transmit FIFO when DATA[FRETSC] is 1 and DATA[R9T9] is 0. 0b - 9 to 13 bit times 1b - 12 to 15 bit times
25 LBKDE	LIN Break Detection Enable Enables LIN break detection. If this field is 0, LIN break detect is disabled, and only a normal break character can be detected. If this field is 1, LIN break detect is enabled and the LIN break character is detected at a length of 11 bit times (if CTRL[M] is 0), 12 bit times (if CTRL[M] is 1), or 13 bit times (if BAUD[M10] is 1). This field selects a longer break character detection length. When the field is 1, receive data is not stored in the receive FIFO. **NOTE** This field enables the LIN break detect circuit and disables writing receive data to FIFO. Therefore, it ignores all characters except a LIN break. 0b - Disable 1b - Enable
24 RAF	Receiver Active Flag Indicates whether the LPUART receiver is idle or active. This field becomes 1 when the receiver detects the beginning of a valid start bit, and the field becomes 0 automatically when the receiver detects an idle line. 0b - Idle, waiting for a start bit 1b - Receiver active (RXD pin input not idle)
23 TDRE	Transmit Data Register Empty Flag Indicates whether the transmit FIFO level is greater than, equal to, or less than the watermark. After the transmit FIFO is enabled, this field becomes 1 when the number of datawords in the transmit FIFO is equal to, or less than the number that WATER[TXWATER] indicates. To make the value of this field 0, write to it until the number of words in the transmit FIFO is greater than the number that WATER[TXWATER] indicates. After the transmit FIFO is disabled, this field becomes 1 to indicate that the FIFO level is less than the watermark. To make the value of this field 0 again, write to Data (DATA). This register is not affected by a character that is in the process of being transmitted; it is updated at the start of each transmitted character. 0b - Greater than watermark 1b - Equal to or less than watermark
22	Transmission Complete Flag Indicates whether the transmitter is active.

Table continues on the next page...

Table continued from the previous page...

Field	Function
TC	This field becomes 0 when a transmission is in progress or a preamble or break character is loaded; in other words, when the transmitter is active (sending data, a preamble, or a break). The field becomes 1 when the transmit buffer is empty and no data, preamble, or break character is being transmitted; in other words, when the transmission activity is complete. When this happens, the transmit data output signal becomes idle (logic 1). This field becomes 0 after you write to Data (DATA) to transmit new data, queuing a preamble by first writing 0 and then writing 1 to CTRL[TE], queuing a break character by writing 1 to CTRL[SBK]. 0b - Transmitter active 1b - Transmitter idle
21 RDRF	Receive Data Register Full Flag Indicates whether the receive FIFO level is less than, equal to, or greater than the watermark. This field becomes 1 when the number of datawords in the receive buffer is greater than the number that WATER[RXWATER] indicates and the receive FIFO is enabled. To write 0 to this field, read Data (DATA) until the number of datawords in the receive FIFO is equal to, or less than the number that WATER[RXWATER] indicates. When the receive FIFO is disabled, this field (RDRF) becomes 1 if the receive buffer (Data (DATA)) is full. To make this field 0, read Data (DATA). A character that is in the process of being received does not cause a change in this field until the entire character is received. Even if this field is 1, the character continues to be received until an overrun condition occurs after the entire character is received. 0b - Equal to or less than watermark 1b - Greater than watermark
20 IDLE	Idle Line Flag Indicates whether an idle line is detected. This field becomes 1 when the LPUART receive line becomes idle for a full character time after a period of activity. When CTRL[ILT] is 0, the receiver starts counting idle bit times after the start bit. If the receive character is all 1s, these bit times and the stop bit time count towards the full character time of logic high, 10 to 13 bit times, needed for the receiver to detect an idle line. After CTRL[ILT] becomes 1, the receiver does not start counting idle bit times until after the stop bits. The stop bits and any logic high bit times at the end of the previous character do not count towards the full character time of logic high needed for the receiver to detect an idle line. For this field to become 0, write 1 to it. After the field becomes 0, you cannot write 1 to it again until after a new character is stored in the receive buffer or a LIN break character writes 1 to STAT[LBKDIF]. This field becomes 1 only once, even if the receive line remains idle for an extended period. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Idle line detected 1b - Idle line not detected When writing

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - No effect 1b - Clear the flag
19 OR	Receiver Overrun Flag Indicates whether there is receive overrun. This field becomes 1 when you cannot prevent STAT[RDRF] from overflowing with data. The field becomes 1 immediately after the stop bit is completely received for the dataword that overflows the buffer and all the other error fields (STAT[FE], STAT[NF], and STAT[PF]) are prevented from becoming 1. The data in the shift register is lost, but the data already in the LPUART data registers is not affected. If STAT[LBKDE] is enabled and a LIN break is detected, this field becomes 1 if STAT[LBKDIF] is not 0 before the next data character is received. When this field is 1, no additional data is stored in the receive FIFO even if sufficient room exists. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No overrun 1b - Receive overrun (new LPUART data is lost) When writing 0b - No effect 1b - Clear the flag
18 NF	Noise Flag Indicates whether noise is detected in the received character of Data (DATA). The advanced sampling technique used in the receiver takes three samples in each of the received bits. If some of these samples disagree with the rest of the samples within any bit time in the frame, then noise is detected for that character. This field becomes 1 whenever the next character to be read from Data (DATA) is received with noise detected within the character. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No noise detected 1b - Noise detected When writing 0b - No effect 1b - Clear the flag
17 FE	Framing Error Flag Indicates whether a framing error is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field becomes 1 whenever the next character to be read from Data (DATA) is received with logic 0 detected where a stop bit was expected. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No framing error detected (this does not guarantee that the framing is correct) 1b - Framing error detected When writing 0b - No effect 1b - Clear the flag
16 PF	Parity Error Flag Indicates whether a parity error is detected. This field becomes 1 whenever the next character to be read from Data (DATA) is received when parity is enabled (CTRL[PE] is 1) and the parity bit in the received character does not agree with the expected parity value. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No parity error detected 1b - Parity error detected When writing 0b - No effect 1b - Clear the flag
15 MA1F	Match 1 Flag Indicates whether the received data is equal to MATCH[MA1]. This field becomes 1 whenever the next character to be read from Data (DATA) matches the value of MATCH[MA1]. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Not equal to MA1 1b - Equal to MA1 When writing

Table continues on the next page...

<tr><td>1
AME</td><td>Address Mark Enable
Configures the location of the address mark when configured for MSB first transfers.
This field has no effect when configured for LSB first and you must change the value of this field only when both the transmitter and receiver are disabled. If this field is 0, address mark in character is MSB. If this field is 1, the address mark is stored in Data (DATA) at MSB (or MSB-1 when the parity bit is enabled). In other words, the address mark in character is the last bit before the stop bit (or parity bit when enabled).
0b - Disable
1b - Enable</td></tr>
<tr><td>0
LBKFE</td><td>LIN Break Flag Enable
Enables the LIN break flag to assert whenever a LIN break character is detected.
Unlike STAT[LBKDE], this does not impact data being stored in the receive data buffer, but does cause STAT[LBKDIF] to become 1 whenever a LIN break is detected.
Because a LIN break is longer than a normal character, the LIN break triggers a write to STAT[RDRF] with the data fields as 0 and STAT[FE] as 1. The character following the LIN break has DATA[LINBRK] as 1 to indicate that the previous character was a LIN break.
You must change the value of this field only when both the transmitter and receiver are disabled.</td></tr>
</table>

Table continues on the next page...

Table continued from the previous page...

Field	Function
	If this field is 1, the LIN break character is detected at a length of 11-bit times (if CTRL[M] is 0), 12 (if CTRL[M] is 1), or 13 (if BAUD[M10] is 1). 0b - Disable 1b - Enable

79.6.1.8 Control (CTRL)

Offset

Register	Offset
CTRL	18h

Function

Controls various optional features of the LPUART system.

You must write to the fields of this register only when both the transmitter and receiver are disabled.

Diagram

Fields

Field	Function
31 R8T9	Receive Bit 8 Transmit Bit 9 Contains R8 and T9 that correspond to different functions. R8 is the ninth data bit received after you configure LPUART for 9-bit or 10-bit data formats. When reading 9-bit or 10-bit data, read R8 before reading Data (DATA). T9 is the tenth data bit transmitted after you configure LPUART for 10-bit data formats. When writing 10-bit data, write T9 before writing to Data (DATA). If T9 does not need to change from its previous value, such

Table continues on the next page...

Table continued from the previous page...

Field	Function
	as when it is used to generate address mark or parity, then you need not write to it each time you write to Data (DATA). **NOTE** R8 is a read-only bit and T9 is a write-only bit; the value read is different from the value written.
30 R9T8	Receive Bit 9 Transmit Bit 8 Contains R9 and T8 that correspond to different functions. R9 is the tenth data bit received after you configure LPUART for 10-bit data formats. When reading 10-bit data, read R9 before reading Data (DATA). T8 is the ninth data bit transmitted after you configure LPUART for 9-bit or 10-bit data formats. When writing 9-bit or 10-bit data, write T8 before writing to Data (DATA). If T8 does not need to change from its previous value, such as when it is used to generate address mark or parity, then you need not write to it each time you write to Data (DATA). **NOTE** R9 is a read-only field and T8 is a write-only field; the value read is different from the value written.
29 TXDIR	TXD Pin Direction in Single-Wire Mode Determines the direction of data at the TXD pin, in Single-Wire mode, when LPUART is configured for a single-wire half-duplex operation (CTRL[LOOPS] and CTRL[RSRC] are 1). When writing 0 to this field, the transmitter finishes transmitting the current character (if any) before the receiver starts receiving data from the TXD pin. 0b - Input 1b - Output
28 TXINV	Transmit Data Inversion Specifies whether transmit data is inverted. Writing 1 to this field reverses the polarity of the transmitted data output. This action inverts the TXD output for all cases: data bits, start and stop bits, break, and idle. 0b - Not inverted 1b - Inverted
27 ORIE	Overrun Interrupt Enable Enables STAT[OR] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when OR interrupts are disabled. 0b - Disable 1b - Enable
26	Noise Error Interrupt Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
NEIE	Enables STAT[NF] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when NF interrupts are disabled. 0b - Disable 1b - Enable
25 FEIE	Framing Error Interrupt Enable Enables STAT[FE] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when FE interrupts are disabled. 0b - Disable 1b - Enable
24 PEIE	Parity Error Interrupt Enable Enables STAT[PF] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when PF interrupts are disabled. 0b - Disable 1b - Enable
23 TIE	Transmit Interrupt Enable Enables STAT[TDRE] to generate interrupt requests if STAT[TDRE] is 1. 0b - Disable 1b - Enable
22 TCIE	Transmission Complete Interrupt Enable Enables STAT[TC] to generate interrupt requests if STAT[TC] is 1. 0b - Disable 1b - Enable
21 RIE	Receiver Interrupt Enable Enables STAT[RDRF] to generate hardware interrupt requests if STAT[RDRF] is 1. 0b - Disable 1b - Enable
20 ILIE	Idle Line Interrupt Enable Enables hardware interrupts. This field enables STAT[IDLE] to generate interrupt requests. If this field is 0, hardware interrupts from STAT[IDLE] are disabled and polling is used, and if this field is 1, hardware interrupts are enabled when STAT[IDLE] is 1. 0b - Disable 1b - Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
19 TE	Transmitter Enable Enables the LPUART transmitter. Using this field, you can also queue an idle preamble by first writing 0 and then writing 1 to this field. After this field becomes 0, the field reads 1 until the transmitter has completed the current character and the TXD pin is tristated. You can also queue a single idle character by writing to the transmit FIFO with DATA[FRETSC] and DATA[R9T9] = 1. 0b - Disable 1b - Enable
18 RE	Receiver Enable Enables the LPUART receiver. After you write 0 to this field, this field remains 1 until the receiver finishes receiving the current character (if any). 0b - Disable 1b - Enable
17 RWU	Receiver Wake-Up Control Specifies whether the LPUART receiver in standby is waiting for a wake-up condition. You can write 1 to this field to place the LPUART receiver in a Standby state. The field becomes 0 automatically when an RWU event occurs, that is, in case of an idle event when CTRL[WAKE] is 0 or an address match when CTRL[WAKE] is 1 and STAT[RWUID] is 0. **NOTE** You must write 1 to this field only when CTRL[WAKE] is 0 (wake-up on idle), if the channel is currently not idle. You can determine this by the value of STAT[RAF]. If the field is 1 to wake up an idle event and the channel is already idle, LPUART, possibly, discards the data. This is because the data must be received or a LIN break is detected after an Idle condition is detected before the IDLE flag is allowed to be reasserted. 0b - Normal receiver operation 1b - LPUART receiver in standby, waiting for a wake-up condition
16 SBK	Send Break Specifies whether queue break character(s) are to be sent. Writing 1 and then 0 to this field queues a break character in the transmit data stream. Additional break characters of 9 to 13 bits, or 12 to 15 bits if STAT[BRK13] is 1, and bit times of logic 0 are queued as long as this field is 1. Depending on the timing when this field is 1 and 0, relative to the character currently being transmitted, a second break character may be queued before you write 0 to this field. If the time taken to write 0 to this field is too long, for example, if the field does not become 0 by the end of the first break character, a second break character is sent. This is compared to queuing a break character through the transmit FIFO that guarantees only one break character is sent.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	You can also queue a single break character by writing to the transmit FIFO when DATA[FRETSC] is 1 and DATA[R9T9] is 0. 0b - Normal transmitter operation 1b - Queue break character(s) to be sent
15 MA1IE	Match 1 (MA1F) Interrupt Enable Enables the MA1F interrupt. 0b - Disable 1b - Enable
14 MA2IE	Match 2 (MA2F) Interrupt Enable Enables the MA2F interrupt. 0b - Disable 1b - Enable
13 —	Reserved
12 —	Reserved
11 M7	7-Bit Mode Select Specifies the data characters that the receiver and transmitter use. You must change the value of this field only after both the transmitter and receiver are disabled. 0b - 8-bit to 10-bit 1b - 7-bit
10-8 IDLECFG	Idle Configuration Configures the number of idle characters that must be received before you write 1 to STAT[IDLE]. 000b - 1 001b - 2 010b - 4 011b - 8 100b - 16 101b - 32 110b - 64 111b - 128
7	Loop Mode Select

Table continues on the next page...

Table continued from the previous page...

Field	Function
LOOPS	Selects Loop mode. After this field becomes 1, the RXD pin is disconnected from LPUART and the transmitter output is internally connected to the receiver input. The transmitter and receiver must be enabled to use the loop function. In Loop mode or Single-Wire mode, the transmitter outputs are internally connected to the receiver input (see CTRL[RSRC]). 0b - Normal operation: RXD and TXD use separate pins 1b - Loop mode or Single-Wire mode
6 DOZEEN	Doze Mode Enables LPUART in Doze mode. If this field is 1, LPUART remains active when not in Doze mode. 0b - Enable 1b - Disable
5 RSRC	Receiver Source Select Determines the source of the receiver shift register input if CTRL[LOOPS] is 1. This field has no effect unless CTRL[LOOPS] is 1. If this field is 0, internal Loopback mode is selected. LPUART does not use the RXD pin. Additionally, the CTS_B pin is not used and internally driven by the RTS_B output. If this field is 1, single-wire LPUART mode is selected where the TXD pin is connected to the transmitter output and receiver input. 0b - Internal Loopback mode 1b - Single-wire mode
4 M	9-Bit Or 8-Bit Mode Select Specifies the data characters that the receiver and transmitter use. 0b - 8-bit 1b - 9-bit
3 WAKE	Receiver Wake-Up Method Select Determines which condition wakes up LPUART when CTRL[RWU] = 1 and BAUD[MATCFG] = 0 (this field must be 1 when BAUD[MATCFG] = 11): • Address mark in the bit preceding the stop bit (or bit preceding the parity bit when parity is enabled) of the received data character • An idle condition on the receive pin input signal If this field is 0, CTRL[RWU] is configured for idle line wake-up, and if this field is 1, CTRL[RWU] is configured with address mark wake-up. 0b - Idle 1b - Mark

Table continues on the next page...

Table continued from the previous page...

Field	Function
2 ILT	Idle Line Type Select Determines when the receiver starts counting logic 1s as idle character bits. The count begins either after a valid start bit or the stop bit. If the count begins after the start bit, a string of logic 1s preceding the stop bit can cause false recognition of an idle character. Beginning the count after the stop bit avoids false idle character recognition, but requires properly synchronized transmissions. **NOTE** In case you write 1 to this field, a logic 0 is automatically shifted after a received stop bit, therefore resetting the idle count. 0b - After the start bit 1b - After the stop bit
1 PE	Parity Enable Enables hardware parity generation and checking. If parity is enabled, the bit immediately before the stop bit is treated as the parity bit. 0b - Disable 1b - Enable
0 PT	Parity Type Selects the type of parity, even or odd, if parity is enabled (CTRL[PE] = 1): • Odd parity means that the total number of logic 1 bits in the data character, including the parity bit, is odd. • Even parity means that the total number of 1s in the data character, including the parity bit, is even. 0b - Even parity 1b - Odd parity

79.6.1.9 Data (DATA)

Offset

Register	Offset
DATA	1Ch

Function

Supports 8-bit, 16-bit, or 32-bit writes, each type of write performing a separate function. An 8-bit write to DATA[7:0] pushes {CTRL[R8T9], CTRL[R9T8], DATA[7:0]} the transmit FIFO with TSC clear. A 16-bit or 32-bit write pushes the data written into the FIFO and does not update the value of CTRL[R8T9] or CTRL[R9T8].

Reads and writes of this register are also involved in the automatic flag clearing mechanisms for some of the LPUART status fields.

NOTE

Reads return the contents of the read-only receive FIFO and writes go to the write-only transmit FIFO, making this register work as a set of two separate registers.

Diagram

Fields

Field	Function
31-16 —	Reserved
15 NOISY	Noisy Data Received Indicates whether the current received dataword contained in DATA[R9:R0] is received with noise. 0b - Received without noise 1b - Received with noise
14 PARITYE	Parity Error Indicates whether the current received dataword contained in DATA[R9:R0] is received with a parity error. 0b - Received without a parity error 1b - Received with a parity error
13 FRETSC	Frame Error Transmit Special Character Specifies the way the dataword is received. For reads, this field indicates that the current received dataword contained in DATA[R9:R0] is received with a frame error. For writes, the field indicates that a break or idle character is to be transmitted instead of the contents in DATA[T9:T0]. T9 indicates a break character when it is 0 and indicates an idle character when it is 1. The contents of DATA[T8:T0] must be 0. 0b - Received without a frame error on reads or transmits a normal character on writes 1b - Received with a frame error on reads or transmits an idle or break character on writes
12	Receive Buffer Empty

Table continues on the next page...

Table continued from the previous page...

Field	Function
RXEMPT	Indicates whether the receive buffer contains valid data. This field becomes 1 when there is no data in the receive buffer. The field does not consider data in the receive shift register. 0b - Valid data 1b - Invalid data and empty
11 IDLINE	Idle Line Indicates whether the receiver line was idle before receiving the character in DATA[9:0]. It can be read as “1” on the first character when the receiver is first enabled. The difference between this field and STAT[IDLE] is that, STAT[IDLE] flag does not set on an idle line after the receiver is first enabled, it needs to receive a character before it can become set, whereas this field does not have this limitation and can be set on the first character received if an idle line is detected beforehand. 0b - Not idle 1b - Idle
10 LINBRK	LIN Break Indicates whether the receiver line detected a LIN break before receiving the character in DATA[9:0]. This field requires the value of STAT[LBKDIF] to be 1. If this field is 0, the LIN break detect circuitry is disabled. 0b - Not detected 1b - Detected
9 R9T9	Read receive FIFO bit 9 or write transmit FIFO bit 9
8 R8T8	Read receive FIFO bit 8 or write transmit FIFO bit 8
7 R7T7	Read receive FIFO bit 7 or write transmit FIFO bit 7
6 R6T6	Read receive FIFO bit 6 or write transmit FIFO bit 6
5 R5T5	Read receive FIFO bit 5 or write transmit FIFO bit 5
4 R4T4	Read receive FIFO bit 4 or write transmit FIFO bit 4
3 R3T3	Read receive FIFO bit 3 or write transmit FIFO bit 3

Table continues on the next page...

Table continued from the previous page...

Field	Function
2 R2T2	Read receive FIFO bit 2 or write transmit FIFO bit 2
1 R1T1	Read receive FIFO bit 1 or write transmit FIFO bit 1
0 R0T0	Read receive FIFO bit 0 or write transmit FIFO bit 0

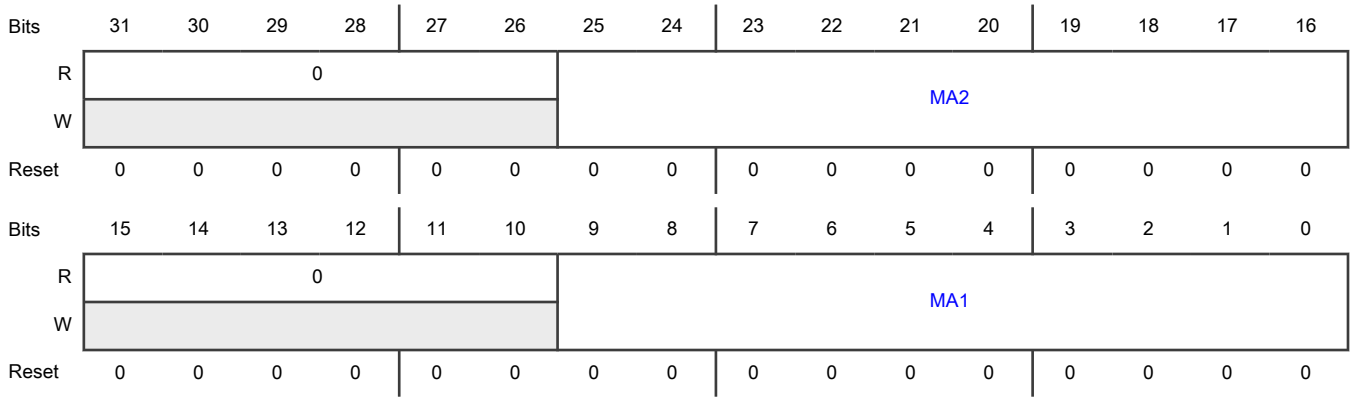
79.6.1.10 Match Address (MATCH)

Offset

Register	Offset
MATCH	20h

Function
Provides addresses for address matching during the receiver operation.

Diagram



Fields

Field	Function
31-26 —	Reserved
25-16 MA2	Match Address 2

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Is compared to input data addresses when the most significant bit is 1 and the associated Baud Rate (BAUD) field is 1. If a match occurs, the data that follows is transferred to Data (DATA). If a match fails, the data that follows is discarded. You must write to MATCH[MA1] and MATCH[MA2] only when the associated Baud Rate (BAUD) field is 0.
15-10 —	Reserved
9-0 MA1	Match Address 1 Is compared to input data addresses when the most significant bit is 1 and the associated Baud Rate (BAUD) field is 1. If a match occurs, the data that follows is transferred to Data (DATA). If a match fails, the data that follows is discarded. You must write to MATCH[MA1] and MATCH[MA2] fields only when the associated field in Baud Rate (BAUD) is 0.

79.6.1.11 MODEM IrDA (MODIR)

Offset

Register	Offset
MODIR	24h

Function
Controls options for setting the MODEM configuration.

Diagram

Fields

Field	Function
31-19 —	Reserved
18 IREN	IR Enable Enables IR modulation and demodulation. You must change the value of this field only when both the transmitter and receiver are disabled. 0b - Disable 1b - Enable
17-16 TNP	Transmitter Narrow Pulse Specifies whether LPUART transmits a 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR narrow pulse when the IR pulse is enabled. You must change the value of this field only when both the transmitter and receiver are disabled. The IR pulse width must be configured to less than half of the OSR. Common pulse widths are 3 ÷ 16, 1 ÷ 16, 1 ÷ 32, or 1 ÷ 4 of the bit length. You can configure these by selecting the appropriate OSR and pulse width. 00b - 1 ÷ OSR 01b - 2 ÷ OSR 10b - 3 ÷ OSR 11b - 4 ÷ OSR
15-12 —	Reserved

Table continued from the previous page...

<table>
<tr><th>Field</th><th>Function</th></tr>
<tr><td>11-8
RTSWATER</td><td>Receive RTS Configuration
Configures the assertion and negation of the receiver's RTS_B output.
The receiver's RTS_B output negates when the number of empty words in the receive FIFO is greater or equal to the value of this field. If this field is 0, the RTS_B pin negates when the receive FIFO is full. For the purpose of receive RTS_B generation, the number of words in the receive FIFO updates when a start bit is detected. This supports additional latency between RTS_B negation and the external transmitter ceasing transmission. If both receive RTS_B and address or data matching is enabled, RTS_B could assert at the end of a character if there exists no match.
You must change the value of this field only when the receiver is disabled.
NOTE
This field is not supported in every instance. The following table includes only supported registers.
<table>
<tr><th>Instance</th><th>Field supported in</th><th>Field not supported in</th></tr>
<tr><td>LPUART_0</td><td>MODIR</td><td>—</td></tr>
<tr><td>LPUART_1</td><td>MODIR</td><td>—</td></tr>

<tr><td>4
TXCTSC</td><td>Transmit CTS Configuration
Configures whether the CTS state or input is checked or sampled at the start of each character or only when the transmitter is idle.
0b - Sampled at the start of each character
1b - Sampled when the transmitter is idle</td></tr>
<tr><td>3
RXRTSE</td><td>Receiver RTS Enable
Allows the RTS output to control the CTS input of the transmitting device to prevent receiver overrun.</td></tr>
</table>

Table continues on the next page...

Table continued from the previous page...

Field	Function
	You must change the value of this field only when the receiver is disabled. If this field is 0, the receiver has no effect on RTS. If this field is 1, RTS is deasserted if STAT[RDRF] is 1 or a start bit is detected that causes STAT[RDRF] to become 1. RTS is asserted if STAT[RDRF] is 0 and has not detected a start bit that causes STAT[RDRF] to become 1. **NOTE** Do not write 1 to both MODIR[RXRTSE] and MODIR[TXRTSE]. 0b - Disable 1b - Enable
2 TXRTSPOL	Transmitter RTS Polarity Controls the polarity of the transmitter RTS. This field does not affect the polarity of the receiver RTS that remains negated in the active-low state unless MODIR[TXRTSE] is 1. You must change the value of this field only when the transmitter is disabled. 0b - Active low 1b - Active high
1 TXRTSE	Transmitter RTS Enable Controls the operation of RTS before and after a transmission. You must change the value of this field only when the transmitter is disabled. If this field is 0, the transmitter has no effect on RTS, and if this field is 1, a character is placed into an empty transmit shift register. RTS asserts 1-bit time before the start bit is transmitted and deasserts 1-bit time after all characters in the transmitter FIFO and shift register are completely sent, including the last stop bit. 0b - Disable 1b - Enable
0 TXCTSE	Transmitter CTS Enable Enables the operation of the transmitter. You can write 1 to this field irrespective of the states of MODIR[TXRTSE] and MODIR[RXRTSE]. If this field is 1, the transmitter checks the state of the CTS signal each time it is ready to send a character. If CTS is asserted, the character is sent. If CTS is deasserted, the TXD signal remains in the mark state and transmission is delayed until CTS is asserted. Changes in CTS, when a character is being sent, do not affect its transmission. 0b - Disable 1b - Enable

79.6.1.12 FIFO (FIFO)

Offset

Register	Offset
FIFO	28h

Function

Provides you the ability to turn on and turn off the FIFO functionality.

This register also provides you the size of the FIFO that has been implemented. You can read this register at any time and must write to it only when CTRL[RE] and CTRL[TE] are 0 and the FIFO is empty.

Diagram

Fields

Field	Function
31-24 —	Reserved
23 TXEMPT	Transmit FIFO Or Buffer Empty Indicates whether the transmit buffer is empty. This field becomes 1 when there is no data in the transmit FIFO or buffer. The field does not consider data in the transmit shift register.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Not empty 1b - Empty
22 RXEMPT	Receive FIFO Or Buffer Empty Indicates whether the receive buffer is empty. This field becomes 1 when there is no data in the receive FIFO or buffer. The field does not consider data in the receive shift register. 0b - Not empty 1b - Empty
21-18 —	Reserved
17 TXOF	Transmitter FIFO Overflow Flag Indicates whether more data has been written to the transmit FIFO than it can hold. If this field is 0, no transmit FIFO overflow has occurred since the last time the field was cleared, and if this field is 1, at least one transmit FIFO overflow has occurred since the last time the field was cleared. This field becomes 1 regardless of the value of FIFO[TXOFE]. However, an interrupt is issued to the host only if FIFO[TXOFE] is 1. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No overflow 1b - Overflow When writing 0b - No effect 1b - Clear the flag
16 RXUF	Receiver FIFO Underflow Flag Indicates whether more data has been read from the receive FIFO than was present. If this field is 0, no receive FIFO underflow has occurred since the last time the field was cleared, and if this field is 1, at least one receive FIFO underflow has occurred since the last time the field was cleared. This field becomes 1 regardless of the value of FIFO[RXUFE]. However, an interrupt is issued to the host only if FIFO[RXUFE] is 1. **NOTE** This field behaves differently for register reads and writes. When reading

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - No underflow 1b - Underflow When writing 0b - No effect 1b - Clear the flag
15 TXFLUSH	Transmit FIFO Flush Causes all data that is stored in the transmit FIFO to be flushed. If you write 0 to this field, no flush operation occurs, and if you write 1 to this field, all data in the transmit FIFO or buffer clears out. This does not affect data in the transmit shift register. 0b - No effect 1b - All data flushed out
14 RXFLUSH	Receive FIFO Flush Causes all data that is stored in the receive FIFO to be flushed. If you write 0 to this field, no flush operation occurs, and if you write 1 to this field, all data in the receive FIFO or buffer clears out. This does not affect data in the receive shift register. 0b - No effect 1b - All data flushed out
13 —	Reserved
12-10 RXIDEN	Receiver Idle Empty Enable Enables STAT[RDRF] to become 1 when the receiver is idle for a number of idle characters and the FIFO is not empty. This feature is not supported when the receiver extended idle time is enabled. 000b - Disable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle 001b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for one character 010b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for two characters 011b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for four characters 100b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for eight characters

Table continues on the next page...

Table continued from the previous page...

Field	Function
	101b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 16 characters 110b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 32 characters 111b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 64 characters
9 TXOFE	Transmit FIFO Overflow Interrupt Enable Enables FIFO[TXOF] to generate an interrupt to the host. 0b - Disable 1b - Enable
8 RXUFE	Receive FIFO Underflow Interrupt Enable Enables FIFO[RXUF] to generate an interrupt to the host. 0b - Disable 1b - Enable
7 TXFE	Transmit FIFO Enable Enables the transmit FIFO. If this field is 0, the transmit buffer operates as a FIFO of depth equal to 1 dataword, regardless of the value in FIFO[TXFIFOSIZE]. Both CTRL[TE] and CTRL[RE] must be 0 before you change the value of this field. If this field is 1, the built-in FIFO structure for the transmit buffer is enabled. FIFO[TXFIFOSIZE] indicates the size of the FIFO structure. 0b - Disable 1b - Enable
6-4 TXFIFOSIZE	Transmit FIFO Buffer Depth Indicates the maximum number of transmit datawords (transmit FIFO buffer depth) that can be stored in the transmit buffer. 000b - 1 001b - 4 010b - 8 011b - 16 100b - 32 101b - 64 110b - 128 111b - 256
3	Receive FIFO Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
RXFE	Enables the receive FIFO. If this field is 0, the receive buffer operates as a FIFO of depth equal to 1 dataword, regardless of the value in FIFO[RXFIFOSIZE]. Both CTRL[RE] and CTRL[TE] must be 0 before you change the value of this field. If this field is 1, the built-in FIFO structure for the receive buffer is enabled. FIFO[RXFIFOSIZE] indicates the size of the FIFO structure. 0b - Disable 1b - Enable
2-0 RXFIFOSIZE	Receive FIFO Buffer Depth Indicates the maximum number of receive datawords (receive FIFO buffer depth) that can be stored in the receive buffer before an overrun occurs. 000b - 1 001b - 4 010b - 8 011b - 16 100b - 32 101b - 64 110b - 128 111b - 256

79.6.1.13 Watermark (WATER)

Offset

Register	Offset
WATER	2Ch

Function

Provides the ability to set a programmable threshold for notification, or sets the programmable thresholds to indicate that transmit data can be written or receive data can be read.

You may read this register at any time but must write to it only when CTRL[TE] is 0.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0 DCTS	Delta Clear To Send Indicates whether the CTS_B pin changed state since the last time this field was 0. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Did not change state 1b - Changed state When writing 0b - No effect 1b - Clear the flag

79.6.1.17 Receiver Extended Idle (REIR)

Offset

Register	Offset
REIR	48h

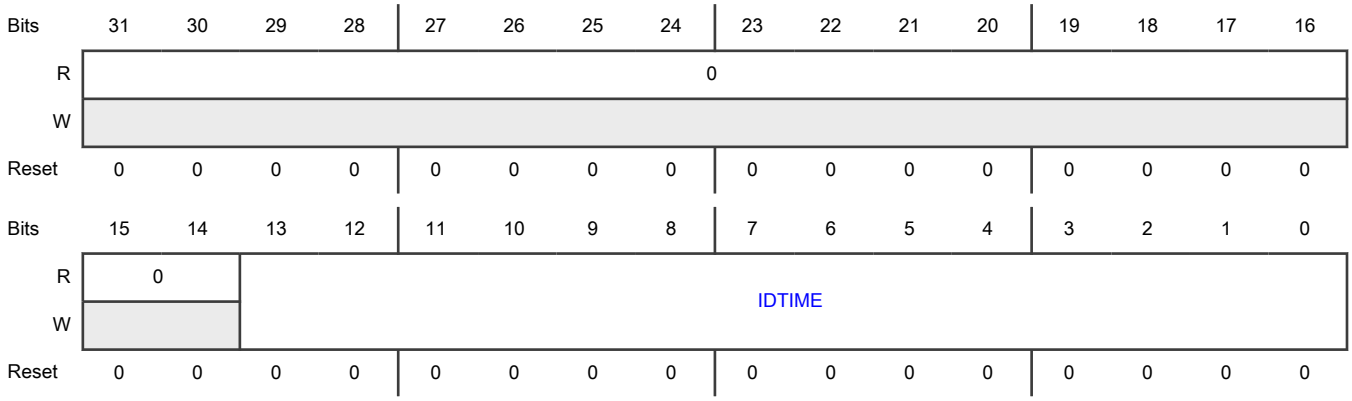
Function

Configures the receiver extended idle functionality. You must not change this value when the receiver is enabled.

NOTE
Each module instance supports a different number of registers.

Instance	Register supported	Register not supported
LPUART_0	REIR	—
LPUART_1	REIR	—
LPUART_2	—	REIR
LPUART_3	—	REIR
LPUART_MSC	—	REIR

Diagram



Fields

Field	Function
31-14 —	Reserved
13-0 IDTIME	Idle Time Configures the idle length in number of bits (baud rate) since the end of the last stop bit. This affects the behavior of the idle wake-up, STAT[IDLE], DATA[IDLINE], and STAT[RAF]. The minimum supported extended idle time is equal to one idle character. The extended idle feature is disabled when this field is 0.

79.6.1.18 Transmitter Extended Idle (TEIR)

Offset

Register	Offset
TEIR	4Ch

Function

Configures the transmitter extended idle functionality. You must not change this value when the transmitter is enabled.

NOTE

Each module instance supports a different number of registers.

Instance	Register supported	Register not supported
LPUART_0	TEIR	—
LPUART_1	TEIR	—
LPUART_2	—	TEIR

Table continues on the next page...

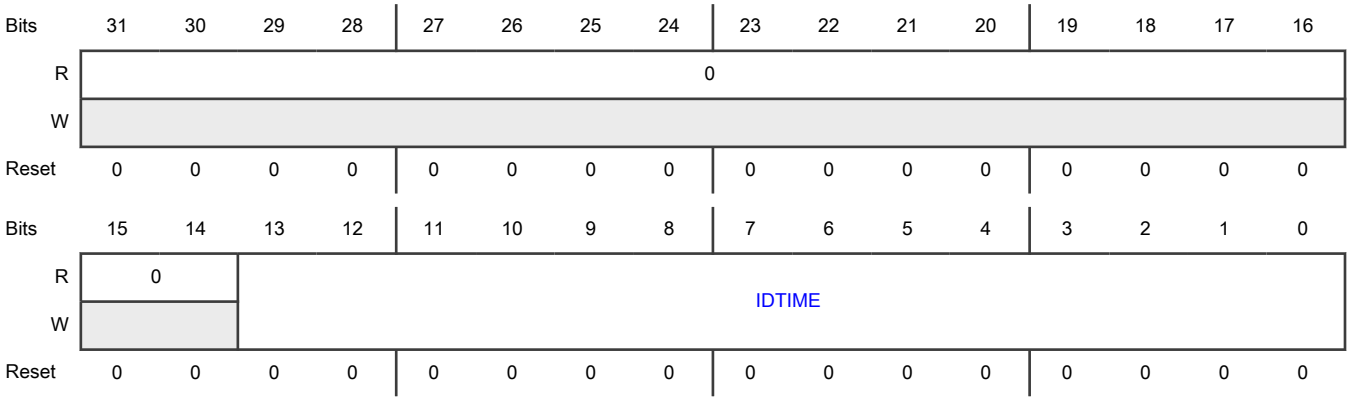
Diagram



Fields

Field	Function
31-14 —	Reserved
13-0 IDTIME	Idle Time Configures the transmitter idle time in number of bits (baud rate) whenever an idle character is queued through the transmit FIFO. An idle character is not automatically queued whenever the transmitter is enabled. The minimum supported extended idle time equals one idle character. The extended idle feature is disabled when this field is 0.

79.6.1.19 Half Duplex Control (HDCR)

Offset

Register	Offset
HDCR	50h

Function

Provides control for half-duplex-related operations.

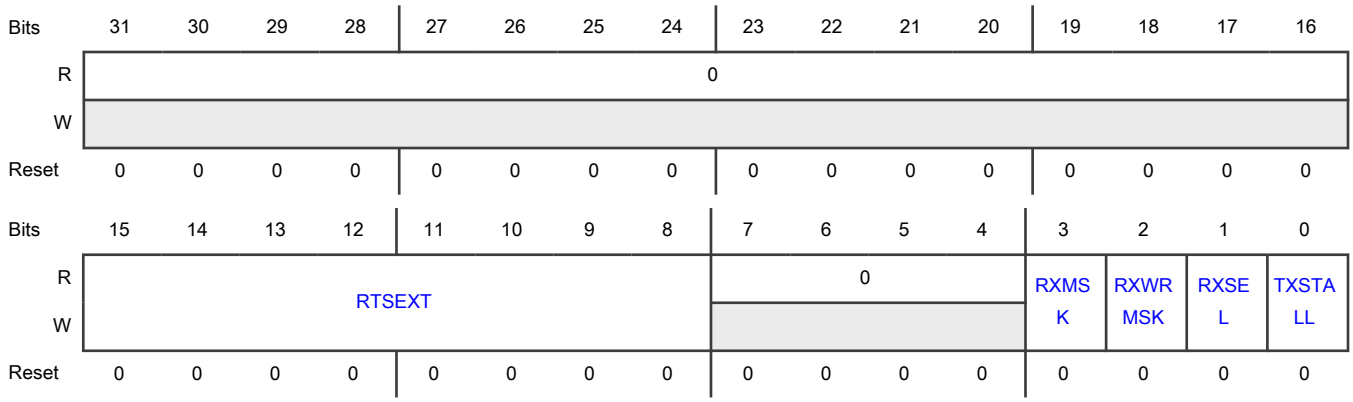
You can use this register instead of CTRL[LOOPS], CTRL[RSRC], and CTRL[TXDIR] functions, although you can use CTRL[LOOPS] to loop-back the transmitter outputs to the receiver.

NOTE

Each module instance supports a different number of registers.

Instance	Register supported	Register not supported
LPUART_0	HDCR	—
LPUART_1	HDCR	—
LPUART_2	—	HDCR
LPUART_3	—	HDCR
LPUART_MSC	—	HDCR

Diagram



Fields

Field	Function
31-16 —	Reserved
15-8 RTSEXT	RTS Extended Specifies RTS extension. The transmit RTS_B remains asserted for (RTSEXT + 1) bit times after the end of the last stop bit. This applies even when the transmitter's RTS_B output is disabled and is only used internally to mask the receiver.
7-4 —	Reserved
3 RXMSK	Receive Mask Specifies whether the transmitter RTS_B masks the receive data pin. When enabled, the transmitter RTS_B masks the receive data pin.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Do not mask 1b - Mask
2 RXWRMSK	Receive FIFO Write Mask Specifies whether the transmitter RTS_B masks writes to the receive FIFO. When enabled, the transmitter RTS_B masks receive FIFO writes, but the idle flag is not affected. 0b - Do not mask 1b - Mask
1 RXSEL	Receive Select Specifies the receive data pin. When enabled, the receive data is sourced from the TXD pin. 0b - RXD 1b - TXD
0 TXSTALL	Transmit Stall Specifies whether the transmitter becomes busy when the receiver is active. When enabled, the transmitter does not become busy or asserts transmitter RTS_B when the receiver is active (STAT[RAF] is 1). 0b - No effect 1b - Does not become busy

79.6.1.20 Timeout Control (TOCR)

Offset

Register	Offset
TOCR	58h

Function

Configures the behavior of the timeout logic. Timeouts 0 and 1 are used to monitor the receiver and timeouts 2 and 3 are used to monitor the transmitter.

NOTE

Each module instance supports a different number of registers.

Instance	Register supported	Register not supported

31-12 —	Reserved
11-8 TOF	Timeout Flag Indicates whether the corresponding timeout occurred. The timeout counter is disabled when this field is 1. **NOTE** This field behaves differently for register reads and writes. When reading

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0000b - Not occurred 0001b - Occurred When writing 0000b - No effect 0001b - Clear the flag
7-4 —	Reserved
3-0 TOZ	Timeout Zero Indicates whether the corresponding timeout counter equals 0.

79.6.1.22 Timeout N (TIMEOUT0 - TIMEOUT3)

Offset

Register	Offset
TIMEOUT0	60h
TIMEOUT1	64h
TIMEOUT2	68h
TIMEOUT3	6Ch

Function
Configures the corresponding timeout counter and status field. Timeouts 0 and 1 are used to monitor the receiver and timeouts 2 and 3 are used to monitor the transmitter. You must write to this register only when the corresponding timeout is disabled or when the value of the corresponding timeout field is 1.

NOTE
Each module instance supports a different number of registers.

Instance	Register supported	Register not supported
LPUART_0	TIMEOUT0–TIMEOUT3	—
LPUART_1	TIMEOUT0–TIMEOUT3	—

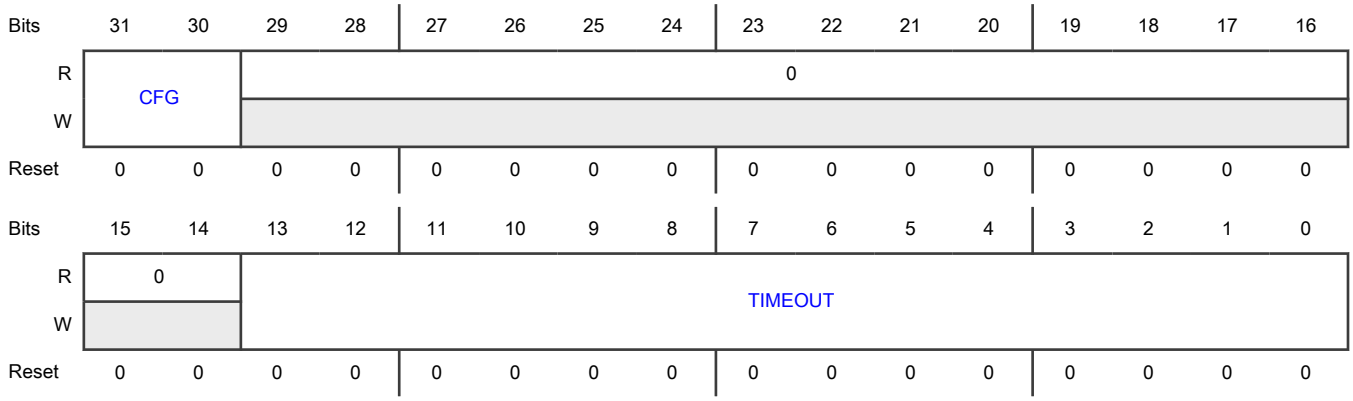
LPUART_3	—	TIMEOUT0–TIMEOUT3
LPUART_MSC	—	TIMEOUT0–TIMEOUT3

Diagram



Fields

Field	Function
31-30 CFG	Idle Configuration Configures the behavior of TIMEOUT[TIMEOUT]. 00b - Becomes 1 after timeout characters are received 01b - Becomes 1 when idle for timeout bit clocks 10b - Becomes 1 when idle for timeout bit clocks following the next character 11b - Becomes 1 when idle for at least timeout bit clocks, but a new character is detected before the extended idle timeout is reached
29-14 —	Reserved
13-0 TIMEOUT	Timeout Value Configures the timeout value.

79.6.1.23 Transmit Command Burst (TCBR0 - TCBR127)

Offset

For a = 0 to 127:

Register	Offset
TCBRa	200h + (a × 4h)

Function

Acts as an alias of Data (DATA), designed to support incrementing burst transfers to the transmit FIFO by a DMA controller, using aligned 8-bit, 16-bit, or 32-bit writes. The size of this register is 512 bytes:

- An aligned 32-bit write in this region pushes one entry into the transmit FIFO.
- An aligned 16-bit write in this region to TCBR*x*[15:0] pushes one entry into the transmit FIFO.

- An 8-bit write in this region to TCBR*x*[7:0] updates DATA[7:0], but does not push the data into the transmit FIFO.
- An 8-bit write in this region to TCBR*x*[15:8] pushes the data written to DATA[15:8] plus the previously written DATA[7:0] into the transmit FIFO.
- An 8-bit or 16-bit write in this region to TXBR*x*[31:16] is ignored.

NOTE

Each module instance supports a different number of registers.

Instance	Register supported	Register not supported

Fields

Field	Function
31-16 —	Reserved
15-0 DATA	Data Enables writing data to Data (DATA).

79.6.1.24 Transmit Data Burst (TDBR0 - TDBR255)

Offset

For a = 0 to 255:

Register	Offset
TDBRa	400h + (a × 4h)

Function

Acts as an alias of Data (DATA), designed to support incrementing burst transfers to the transmit FIFO by a DMA controller using 8-bit, 16-bit, or 32-bit writes. The size of this register is 1024 bytes:

- An aligned 32-bit write in this region pushes four DATA byte entries into the transmit FIFO (DATA0 byte first). The register access is extended by three wait states.
- An aligned 16-bit write in this region to either half of a 32-bit word pushes two DATA byte entries into the transmit FIFO (DATA0 or DATA2 first). The register access is extended by one wait state.
- An 8-bit write in this region pushes one DATA byte entry into the transmit FIFO.

Byte writes to Data (DATA) use the contents of CTRL[R9T8] for the ninth data bit, CTRL[R8T9] for the tenth data bit, and zero extend DATA[FRETSC].

NOTE

Each module instance supports a different number of registers.

Fields

Field	Function
31-24 DATA3	Data3 Enables writing of data to Data (DATA).
23-16 DATA2	Data2 Enables writing of data to Data (DATA).
15-8 DATA1	Data1 Enables writing of data to Data (DATA).
7-0 DATA0	Data0 Enables writing of data to Data (DATA).

79.7 Glossary

Baud rate Number of bits per second that LPUART transmits or receives

Break character Break character is generated when the transmitter is holding the data line at the space level for at least one character time

Oversampling Number of times the receive circuitry samples the receive input per baud period (that is, per data bit)

Chapter 80
Quad Serial Peripheral Interface (QuadSPI)

80.1 Chip-specific QuadSPI information

80.1.1 QuadSPI configuration

Table 687. QuadSPI configuration details

QuadSPI Tx FIFO size	256 words
QuadSPI Rx FIFO size	32 words
Look Up Table Size	16 words
AHB Buffer Size	1024 Bytes

NOTE

Boot from QuadSPI is not supported but execution from external memory is supported.

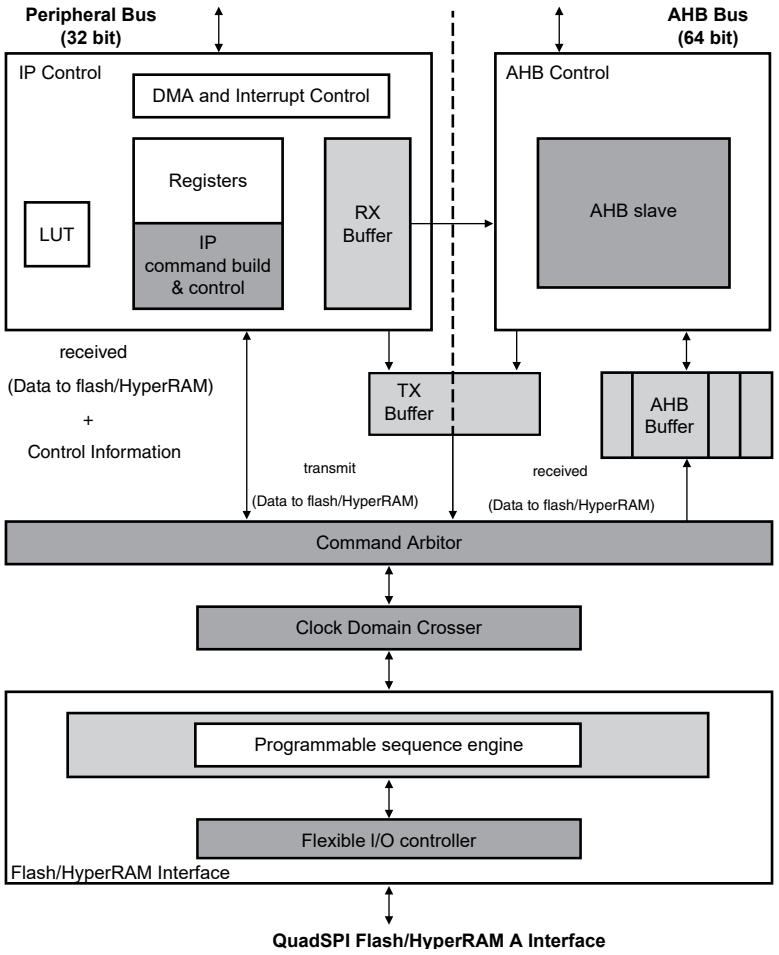

Figure 602. Block diagram

80.1.2 Supported read modes

The table below provides an overview of the QuadSPI read modes.

Table 688. QuadSPI read modes

QSPI Instance	Frequency (MHz)	Slave delay chain Setting (DLL)	Slave delay chain Setting (Tap selection)	DQS setting
QSPI	120	DDR	ON	External
QSPI	120	SDR	ON	Dummy pad loopback
QSPI	120	SDR	OFF	Dummy pad loopback

80.1.3 QuadSPI initialization sequence

Following initialization sequence should be followed for proper QuadSPI operation:

- Enable QuadSPI module by MC_ME peripheral clock enable (register PRTNx_COFBy_CLKEN present within MC_ME). Refer MC_ME chapter for peripheral mapping.
- Configure the SIUL2 registers MSCR[OBE] as 1 and MSCR[SSS] as 0 for QuadSPI_SCKFA pin.
- Initialize QuadSPI SCKFA by writing a sequence of 1010 to the SIUL2 register GPDO[PDO_a] for QuadSPI_SCKFA pin.
- Configure the SIUL2 register MSCR[OBE] back as 0 for the pins.
- Initiate a dummy flash/HyperRAM read to reset all DQS flops by itself and any crossing from DQS domain to IPS/AHB is taken care by CDC logic.
- Initiate a peripheral software reset to QuadSPI controller by writing to QuadSPI controller's MCR.
- Post this initialization sequence, the QuadSPI will work in intended deterministic manner.

NOTE

QuadSPI initialization is to be done before using QuadSPI after each functional reset.

80.1.4 Pad clock loopback

This chip supports pad clock loopback. The QuadSPI can be configured to use clock loopback to sample input data. SCK is delayed by the SCK pin output delay, plus the SCK pin input delay using pad loopback, and is configured by setting QuadSPI config registers SOCCR[SOCCFG] and MCR[DQS_FA_SEL]. Enabling the loopback version of SCK can improve the setup time of the input data from the Flash/HyperRAM.

For details of these register, see QuadSPI register descriptions.

80.1.5 QuadSPI SOC Configuration register SOCCR[SOCCFG] implementation

The QuadSPI SOC Configuration register QuadSPI_SOCCR[SOCCFG] register is used to control dummy loopback pads and obe_pull_timing_relax_b. Below is the description of it's bits:

Table 689. SOCCR[SOCCFG] implementation

Bit	Description
Bit[0]	obe_pull_timing_relax_b : enables the timing relaxation by pulling obe for pad 1 for half cycle, if 0 then enabled else disabled.

Table continues on the next page...

Table 689. SOCCR[SOCCFG] implementation (continued)

Bit[1]	ibe of QSPIA_SCK_DUMMY pad. 0: Disable input receiver 1: Enable input receiver.
Bit[2]	obe of QSPIA_SCK_DUMMY pad. 0: Disable output driver 1: Enable output driver.
Bit[3]	dse of QSPIA_SCK_DUMMY pad. 0: Disable drive strength 1: Enable drive strength.
Bit[4]	pue of QSPIA_SCK_DUMMY pad. 0: Disable internal pullup or pulldown resistor 1: Enable internal pullup or pulldown resistor.
Bit[5]	pus of QSPIA_SCK_DUMMYpad. 0: Enable internal pulldown resistor if pue is set 1: Enable internal pullup resistor if pue is set.
Bit[6]	sre of QSPIA_SCK_DUMMY pad. 0: Disable slew rate control 1: Enable slew rate control.
Bit[31:7]	Reserved

To Enable the Quadspi dummy PAD loopback use following settings

For Flash/HyperRAM-A: MCR[DQS_FA_SEL] = 0x2

SOCCR[SOCCFG] = 0x0000000E (ibe=1, obe=1, dse=1 and sre=0)

NOTE

This SoC does not support dual die flashes. Hence, the signal PCSFA2 from QuadSPI is not used.

80.1.6 Master ID mapping

See the chip-specific XRDC information for details on the master IDs.

80.2 Introduction

The QuadSPI module acts as an interface to a single serial flash memory device, with up to eight bidirectional data lines.

80.2.1 Features

QuadSPI supports the following features:

- Flexible sequence engine to support various flash memory vendor devices. As there is no specific standard, the module supports various kinds of flash memories from different vendors. See Serial flash memory devices for example sequences.
- Single, dual, and quad modes of operation supported for Quad flash memories
- Octal and single IO modes of operation supported for Octal flash memories
- Double Data Rate (DDR)/Double Transfer Rate (DTR) mode in which the data is generated on every edge of the serial flash memory clock
- Flash memory data strobe signal to support data sampling in DDR and Single Data Rate (SDR) mode
- Support for HyperFlash memory
- Support for HyperRAM
- Support for Macronix Octal Data integrity features such as ECC and R/W parity (CRC1)
- AHB master to read RX buffer data through AMBA AHB (64-bit width interface) or IPS registers space (32-bit access) and fill TX buffer via IPS registers space (32-bit access) or using AHB (64-bit width interface)
  - AHB master can be a DMA with a configurable inner loop size
- Multi-master accesses are allowed
  - Flexible and configurable buffer for each master—total available buffer size is 1024 bytes.

- All AHB accesses to flash/RAM memory devices are directly memory mapped to the chip system memory
- Programmable sequence engine to cater to future command/protocol changes and ability to support all existing vendor commands and operations. The software needs to select the corresponding sequence according to the connected flash memory device.
  - Support for all types of addressing

80.2.2 RX buffer push event

To add the valid entries into the RX buffer

By default, each buffer push event adds two entries to the RX buffer because the interface to the serial clock domain is 64 bits in width. Depending on the number of bytes read from the serial flash memory device, it is possible for the very last buffer push event that only one entry is added.

RBSR[RDBFL] is incremented by the number of entries added to the RX buffer.

80.2.3 RX buffer POP event

To remove valid entries from the RX buffer

Each buffer POP event removes (RBCT[WMRK] + 1) valid entries from the buffer. BSR[RDBFL] is decremented by the same number and RBSR[RDCTR] is incremented accordingly.

80.2.4 Block diagram

The following figure shows a block diagram of the QuadSPI module.

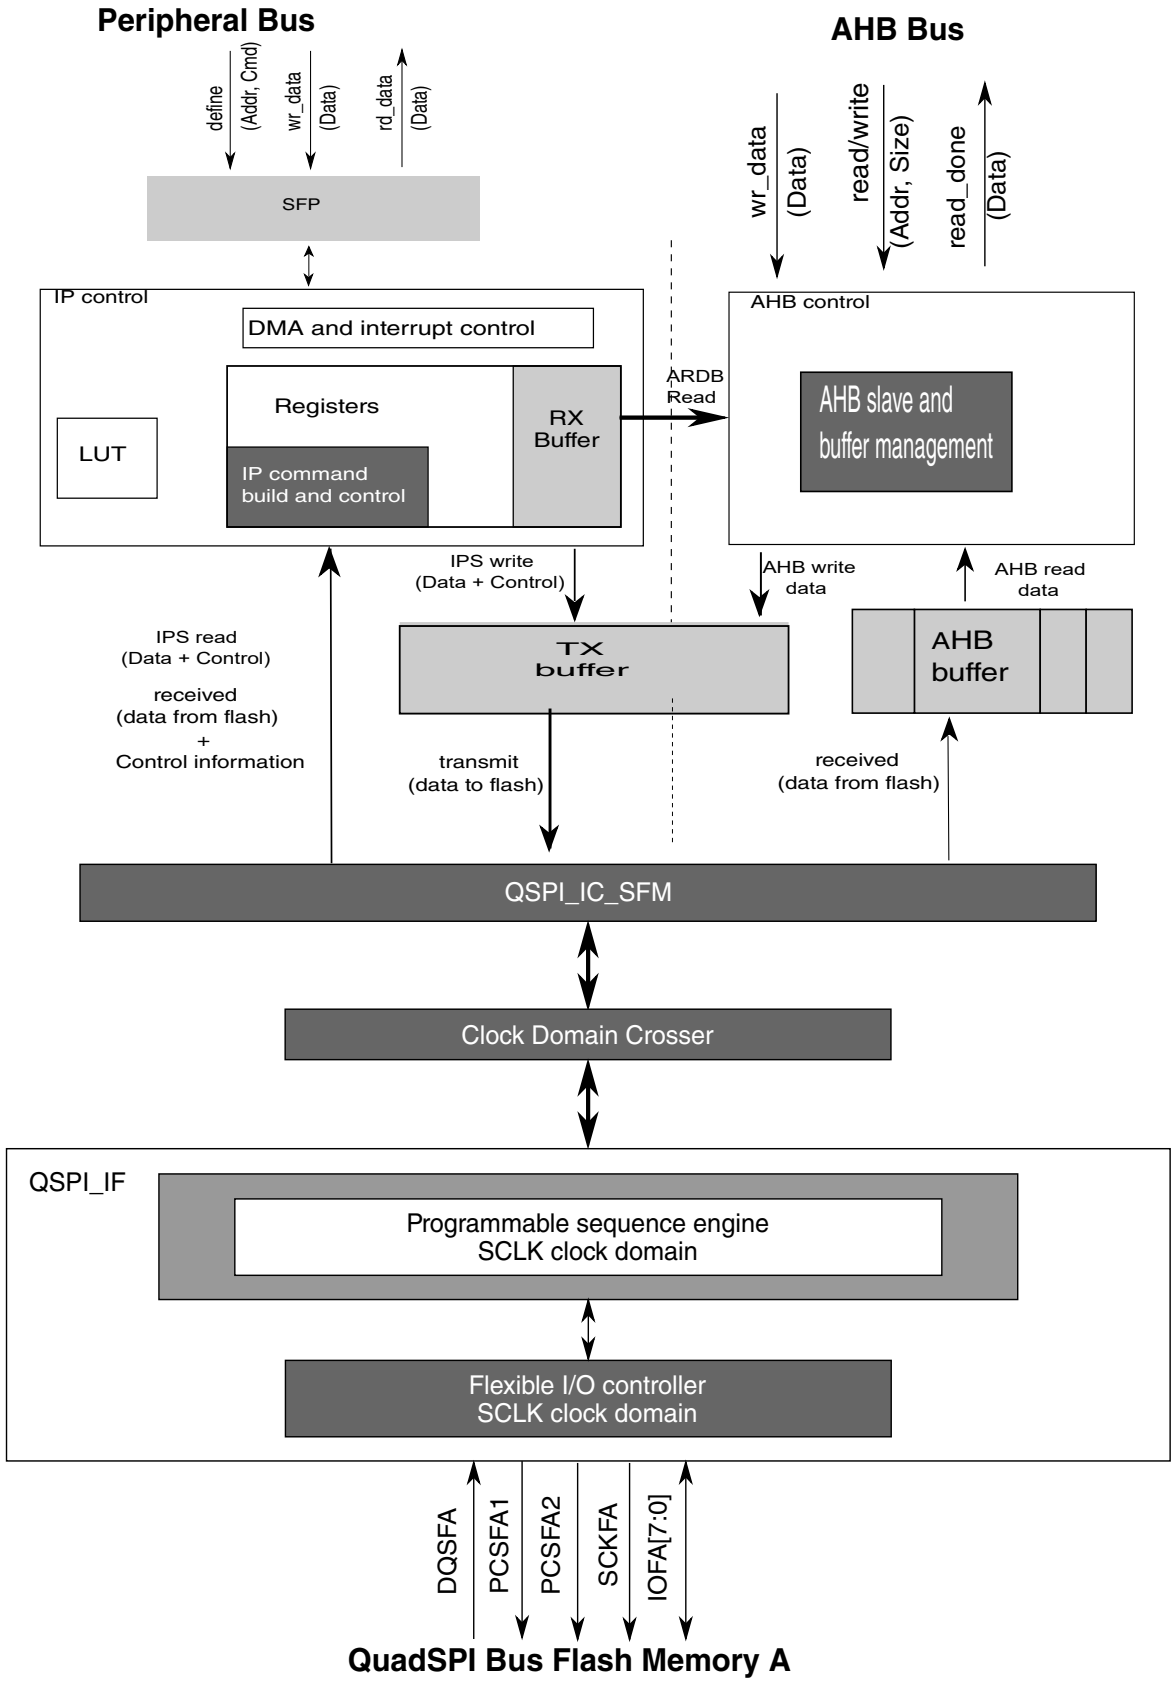

Figure 603. QuadSPI block diagram

80.2.5 QuadSPI modes of operation

QuadSPI supports the following modes of operation:

- Normal mode: You can use this mode for write or read accesses to an external serial flash memory device. See Normal mode for details.
  - Serial flash memory write: You can program data into the flash memory through the IP interface only. See Flash memory programming for details.
  - Serial flash memory read: Read the contents of the serial flash memory device. Two separate read channels are available through the RX buffer and AHB buffer. See Flash memory read for details.
- Module Disable mode: You can use this mode for disabling serial flash memory clock and AHB command. The clock to the non-memory mapped logic in QuadSPI can be stopped in the Module Disable mode. The module enters the mode by setting MCR[MDIS].

80.3 External signal description

This section provides the external signal information for the QuadSPI module.

The following table lists the external signals belonging to the module in conjunction with the different modes of operation.

Table 690. Signal properties

Signal name	Function	Direction	Description
PCSFA1	Peripheral Chip Select Flash Memory A1	O	This signal is the chip select for the serial flash memory device A1 that represents the first of the two flash memory devices that share IOFA.
PCSFA2	Peripheral Chip Select Flash Memory A2	O	This signal is the chip select for the serial flash memory device A2 that represents the second of the two flash memory devices that share IOFA.
SCKFA	Serial Clock Flash Memory A	O	This signal is the serial clock output to the serial flash memory device A.
IOFA[7:0]	Serial I/O Flash memory A	I/O	These signals are the data I/O lines to/from the serial flash memory device A. See Driving external signals for details about the signal drive and timing behavior. Note that the signal pins of the serial flash memory device may change their function according to the SFM Command executed, leaving them as control inputs when single and dual instructions are executed. The module supports driving these inputs to dedicated values. In single I/O mode, QuadSPI drives data on IOFA[0] and expects data on IOFA[1].
DQSFA	Data Strobe signal Flash Memory A	I/O	This is the data strobe signal for port A. Some flash memory vendors provide the Data Read Strobe (DQS) signal to which the read data is aligned in DDR mode. It is also provided as an output signal during write data phase.
INTA	ECC error signal for Flash Memory A	I	Flash Memory A drives this signal to active low value in case of an ECC error.

NOTE

Please refer to chip specific information to check the configuration of QuadSPI block.

80.3.1 Driving external signals

Single/dual/quad/octal instructions

Depending on the serial flash memory device connected to the QuadSPI module, there are instructions using a different number of data lines:

- Single pad: Single line I/O with one data out and one data in line to/from the serial flash memory device
- Dual pad: Dual line I/O with two bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPI module
- Quad pad: Quad line I/O with four bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPImodule
- Octal pad: Octal line I/O with eight bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPI module

The different phases of the serial flash memory access scheme are shown in the following figure.

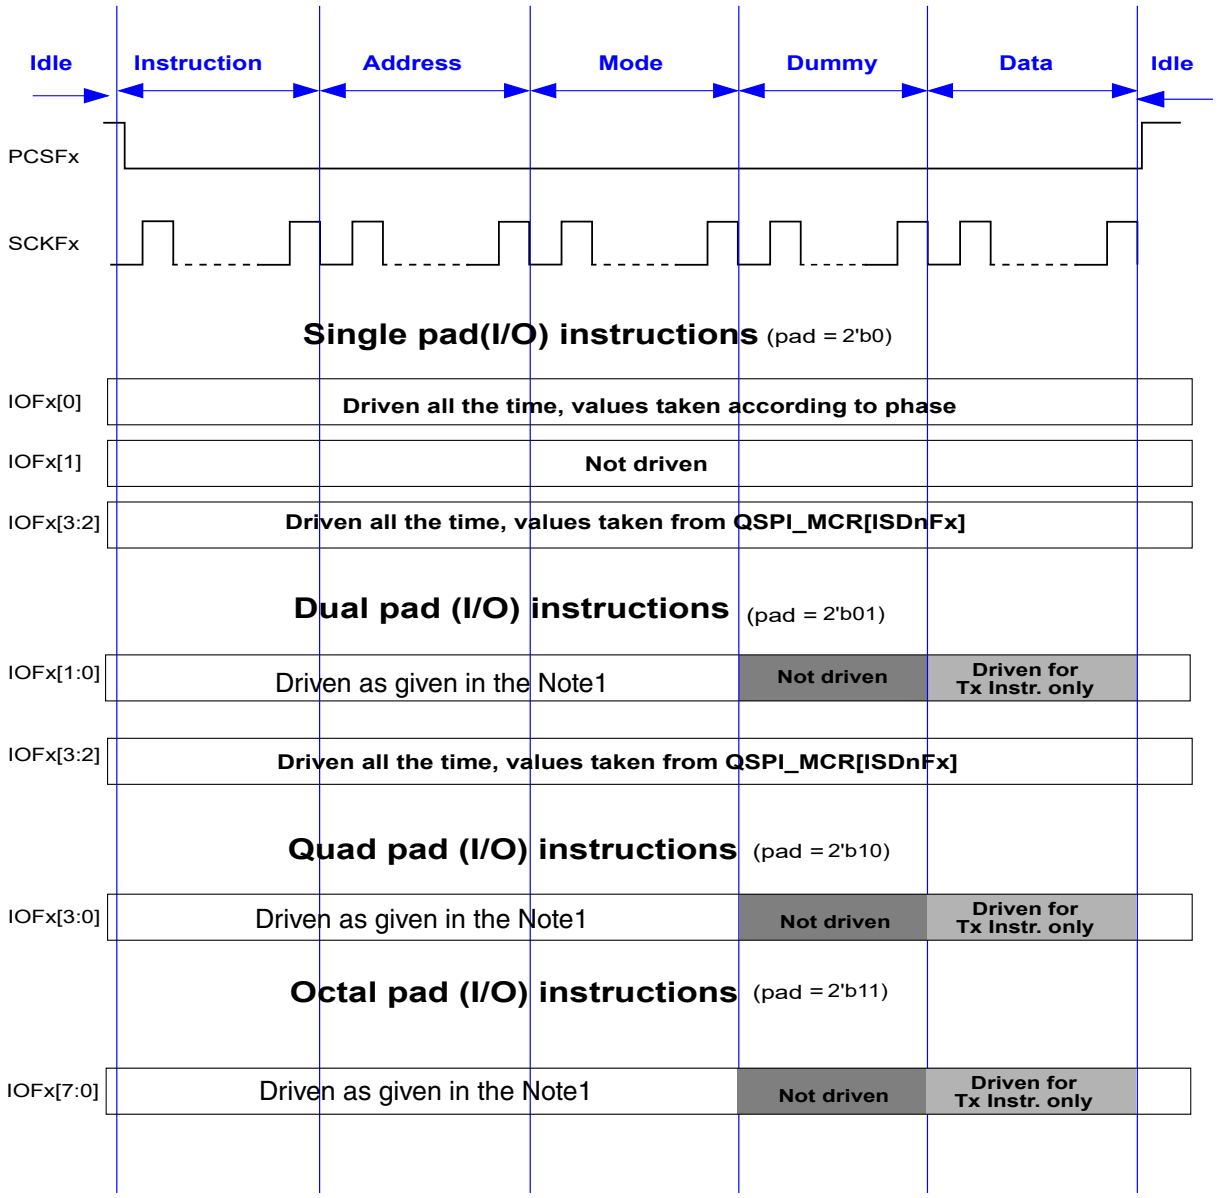

Figure 604. Serial flash memory access scheme

Note1:The IOs are driven from QuadSPI as per the number of pads configured for ongoing phase.

Note:The lines status will change based on command mode in case of instruction, address and mode phases. It can be either 1,2 or 4 lines

Following are the different phases and the I/O driving characteristics of the QuadSPI module:

- Idle: Serial flash memory device not selected – no interaction with the serial flash memory device and the IOFx signals are driven.
- Instruction: Serial flash memory device selected – the instruction is sent to the serial device and all the IOFx signals are driven.
- Address: Serial flash memory address is sent to the device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.
- Mode: Mode bytes are sent to the serial flash memory device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.
- Dummy: Dummy clocks are provided to the serial flash memory device. See Figure 604 for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

— This phase is not applicable for all the SFM commands.

— All read commands in Dual pad, Quad pad /or Octal pad modes must use a Dummy phase immediately before the Data phase. The Dummy phase pad configuration in the LUT must use the same number of pads as the subsequent Data phase. Note that this restriction is not applicable to Single-pad mode.

- Data: Serial flash memory data are sent to or received from the serial flash memory device. See the preceding figure for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

This phase is not applicable for all the SFM commands.

The PCSFx and SCKFx signals are driven permanently throughout all the phases. In the individual flash memory mode, this applies to the selected flash memory device.

Access to a single, individual serial flash memory device

See Serial flash memory access schemes for details.

Read access to two serial flash memory devices attached to the QuadSPI module in parallel. See Serial flash memory access schemes for details.

80.4 Functional description

This section provides a functional description of the QuadSPI module.

80.4.1 Serial flash memory access schemes

In the individual flash memory mode, all supported commands are available.

80.4.2 Normal mode

This mode allows communication with an external serial flash memory device. Compared to the standard SPI protocol, this communication method uses up to eight bidirectional data lines operating at high-data rates. The communication to the external serial flash memory device consists of an instruction code and optional address, mode, dummy, and data transfers. The flexible programmable core engine described below is immune to a wide variety of command or protocol differences in the serial flash memory devices provided by various flash memory vendors.

80.4.2.1 Programmable sequence engine

The core of the QuadSPI module is a programmable sequence engine that works on "instruction-operand" pairs. The core controller executes each programmed instruction sequentially. The complete list of instructions and the corresponding operands are provided in the following table.

Table 691. Instruction set

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
CMD	1d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	8-bit command value	Provides the serial flash memory with the SFM command operand (Encoded) on the number of pads specified in STR mode.
ADDR	2d		Number of address bits to be sent (for example, 24d => 24 address bits required)	Provide the serial flash memory with address cycles according to the operand on the number of pads specified The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions, if the value of SFACR[CAS] is set to 0. Otherwise, the actual address takes CAS into consideration.
DUMMY	3d		Number of dummy clock cycles (should be <= 64 and > 2 cycles)	Provide the serial flash memory with dummy cycles according the operand The PAD information defines the number of pads in input mode. For example, one pad implies that pad 1 is not driven, rest all are driven. **NOTE** If DLL is enabled and N dummy cycles are needed, you must program two back-to-back DUMMY instructions: DUMMY: N-2 followed by DUMMY:2.
MODE	4d		8-bit mode value	Provide the serial flash memory with 8-bit operand on the number of pads specified
MODE2	5d	N={0,1}d	2-bit mode value	Provide the serial flash memory with 2-bit operand on the number of pads[1] specified
MODE4	6d	N={0,1,2}d	4-bit mode value	Provide the serial flash memory with 4-bit operand on the number of pads[2] specified
READ	7d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	Read data size in bytes (for AHB transactions, your application should ensure that data size is a multiple of 8 bytes)	Read data from flash memory on the number of pads specified The data size can be overwritten by writing to the ADATSZ field of the BUFxCR registers for AHB-initiated transactions and to the IDATSZ field of the IP Configuration Register (IPCR) for IPS-initiated transactions.
WRITE	8		Write data size in bytes	Write data on the number of pads specified The data size can be overwritten by writing to the IDATSZ field of IP Configuration Register (IPCR).

Table continues on the next page...

Table 691. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
JMP_ON_CS [3]	9d	NA	Instruction number	Every time the CS is deasserted, jump to the instruction pointed to by the operand. This instruction allows the programmer to specify the behavior of the controller when a new read transaction is initiated following a CS deassertion. **NOTE** This instruction is not supported if DLL is enabled.
ADDR_DDR	10d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	Number of address bits to be sent (for example, 24d => 24 address bits required)	Provide the serial flash memory with address cycles according to the operand on the number of pads specified at each clock edge of serial flash memory clock. The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions if SFACR[CAS] is set to 0. Otherwise, the actual address takes CAS into consideration.
MODE_DDR	11d		8-bit mode value	Provide the serial flash memory with 8-bit operand on the number of pads specified at each clock edge of serial flash memory
MODE2_DDR	12d	N={0}d	2-bit mode value	Provide the serial flash memory with 2-bit operand on the number of pads specified at each clock edge of serial flash memory [4]
MODE4_DDR	13d	N={0,1}d	4-bit mode value	Provide the serial flash memory with 4-bit operand on the number of pads specified at each clock edge of serial flash memory [5].
READ_DDR	14d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d - Eight pads	Read data size in bytes (for AHB transactions, the application should ensure that data size is in multiple of 8 bytes)	Read data from flash memory on the number of pads specified at each clock edge of serial flash memory. The data size might be overwritten by writing to the ADATSZ field of the BUFxCR registers for AHB-initiated transactions and IDATSZ field of IP Configuration Register (IPCR) for IP initiated transactions.
WRITE_DDR	15d		Write data size in bytes	Write data on the number of pads specified at each clock edge of serial flash memory The data size can be overwritten by writing to the IDATSZ field of IP Configuration Register (IPCR).
DATA_LEARN	16d	N={0,1,2,3}d 0d - One pad	Operand[7]-	Find the correct sampling point with the data learning pattern.

Table continues on the next page...

Table 691. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
		1d - Two pads 2d - Four pads 3d- Eight pads	• 1 - DDR mode • 0 - SDR mode Operand[6:0]- • Number of bits to be used for data learning. For example, if operand is 16 then a 16-bit data learning pattern is read and compared.	When this instruction is encountered, the value of Sampling Register (SMPR) is ignored and the controller finds the correct sampling point on its own by sampling the data learning pattern.[6]
CMD_DDR	17d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	8-bit command value	Provides the serial flash memory with the SFM command operand (Encoded) on the number of pads specified in DTR mode.
CADDR	18d		Number of column address bits to be sent (8d means 8 bits of column address is to be sent)	Provide the serial flash memory with column address cycles according to the operand on the number of pads specified. The actual address to be provided to flash memory depends on the value of SFACR[CAS]. For example, if the value of SFACR[CAS] is 3, then the address to flash memory will be [2:0] of incoming address in case of AHB and the value of SFAR in case of IP. This is appended with 0 if SFACR[CAS] is less than number of pads for a flash memory.
CADDR_DDR	19d		Number of column address bits to be sent(8d means 8 bits of column address is to be sent)	Provide the serial flash memory with column address cycles according to the operand on the number of pads specified at each clock edge of the serial flash memory. The actual address to be provided to flash memory depends on the value of SFACR[CAS]. For example, if CAS is 3, then the address to flash memory will be [2:0] of incoming address in case of AHB and the value of SFAR in case of IP. This is appended with 0 if CAS is less than the number of pads for a flash memory.
JMP_TO_SEQ[3]	20d	NA	Sequence number	Every time CS is deasserted, jump to the LUT sequence is pointed to by the operand. This instruction allows the programmer to join two sequences and initiates the second

Table continues on the next page...

Table 691. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
				flash memory transaction automatically. It can be used to join write-enables with flash memory write or data learn with read. **NOTE** This instruction is not supported if DLL is enabled.
STOP[3]	0d	NA	NA	Stop execution; deassert CS

1. For a one-pad instruction, MODE2 takes two serial flash memory clock cycles on the flash memory interface.
2. For a one-pad instruction, MODE4 takes four serial flash memory clock cycles on the flash memory interface. For a four-pad instruction, MODE4 takes one serial flash memory clock cycle on the flash memory interface.
3. Sequence ending with this instruction must have all remaining bits as 0s after it.
4. For a one-pad instruction, MODE2_DDR takes one serial flash memory clock cycle on the flash memory interface.
5. For a one-pad instruction, MODE4_DDR takes two serial flash memory clock cycles on the flash memory interface. For a four-pad instruction MODE4_DDR takes half a cycle on the serial flash memory interface.
6. It is not recommended to have 0h or FFh as the data learning pattern.

The programmable sequence engine allows you to configure the QuadSPI module according to the serial flash memory connected on board. This flexible structure is compatible with new command or protocol changes from different vendors.

80.4.2.2 Flexible read xAHB buffers

To reduce the latency of the reads for AHB masters, the data read from serial flash memory is buffered in flexible AHB buffers. There are four such flexible buffers. The size of each of these buffers is configurable with the minimum size being 0 bytes and maximum size being the size of the complete buffer instantiated (1024 bytes). The size of buffer 0 ranges from 0 to BUF0IND. The size of buffer 1 ranges from BUF0IND to BUF1IND, buffer2 from BUF1IND to BUF2IND and, buffer 3 ranges from BUF2IND to the size of the complete buffer (1024 bytes).

Each flexible AHB buffer is associated with the following:

- An AHB master: Optionally, buffer3 may be configured as an "all master" buffer by writing 1 to BUF3CR[ALLMST]. When buffer3 is configured in such a way, any access from a master not associated with any other buffer is routed to buffer3.
- A datasize field representing the amount of data to be fetched from the flash memory on every missed access.

The master ID of every incoming request is checked and the data is returned or fetched into the corresponding associated buffer. See the chip-specific QuadSPI information for details about master IDs and their corresponding components. Every missed access to the buffer causes the controller to clear the buffer and fetch the BUFxCR[ADATSZ] amount of data from the serial flash memory. As such, you need not configure the buffer size to be greater than ADATSZ because the locations greater than ADATSZ are never used. For any AHB access, the sequence pointed to by BFGENCR[SEQID] is used for the initiated flash memory transaction. The data is returned to the master as soon as the requested amount is read from the serial flash memory. The controller; however, continues to prefetch the rest of the data in anticipation of a next consecutive request. See Figure 605 that shows flexible AHB buffers.

BFGENCR[SEQID] points to an index of the LUT. See LUT for details.

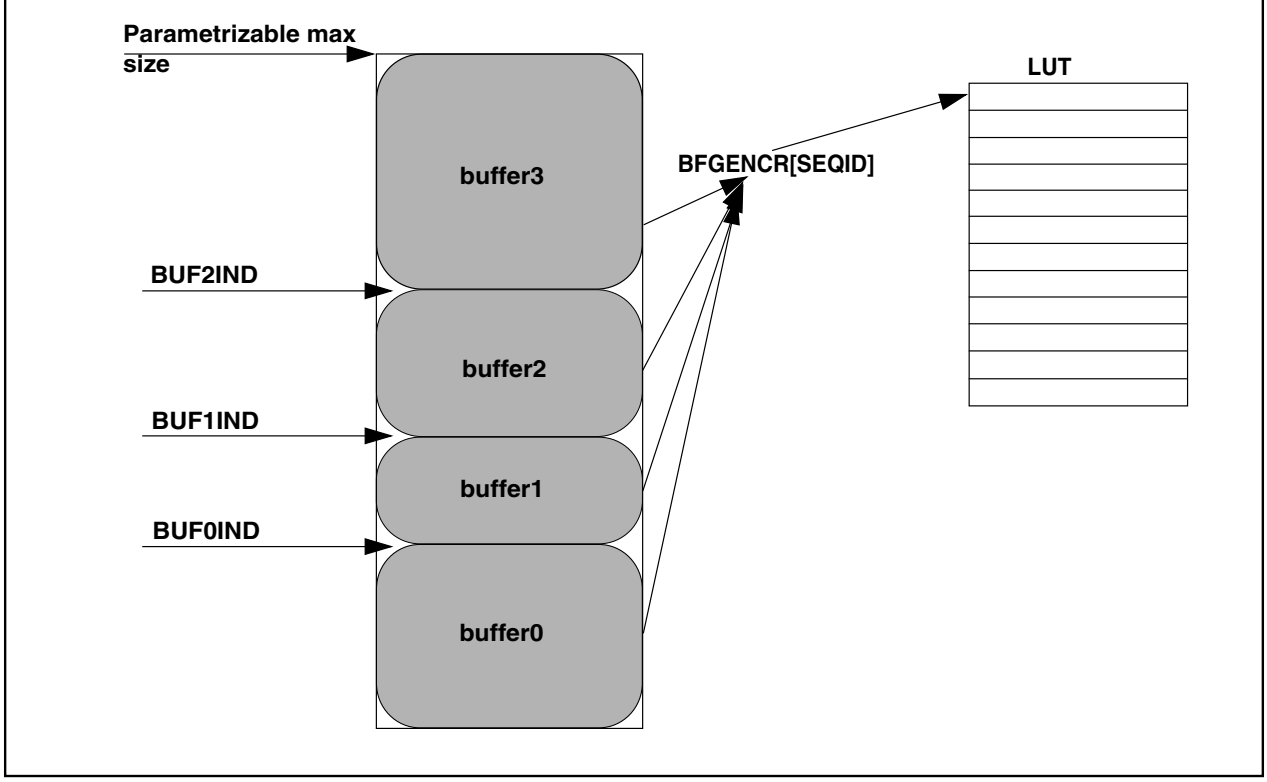

Figure 605. Flexible read AHB buffers

80.4.2.3 Abort mechanism during AHB read

Any ongoing read transaction is aborted if a request from the same master arrives for a location other than the location at which the transaction is going on. The abort can happen at any point of time.

80.4.2.4 HBURST support with AHB read

QuadSPI controller supports HBURST and HSIZE on the AHB read interface. HBURST indicates if the transfer forms part of a burst. Four, eight, and sixteen beat bursts are supported and the bursts might either be incrementing or wrapping. HSIZE indicates the size of the transfer, and supports 8-, 16-, 32-, and 64-bit data sizes. In case of WRAP accesses, QuadSPI generates aligned accesses to serial flash memory if there is no buffer hit for any incoming, non-sequential AHB read access. In case there is a buffer hit, the incoming address in the haddr line is latched as it is. If the total burst size is more than the data prefetch size, an error response is generated and the value of FR[AIBSEF] is configured as 1. The data prefetch size can be defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field when ADATSZ is programmed as 0. In case of wrap burst, data prefetch size must be greater than or equal to the wrap burst size + 32 bytes. A few examples are shown in the figure below:

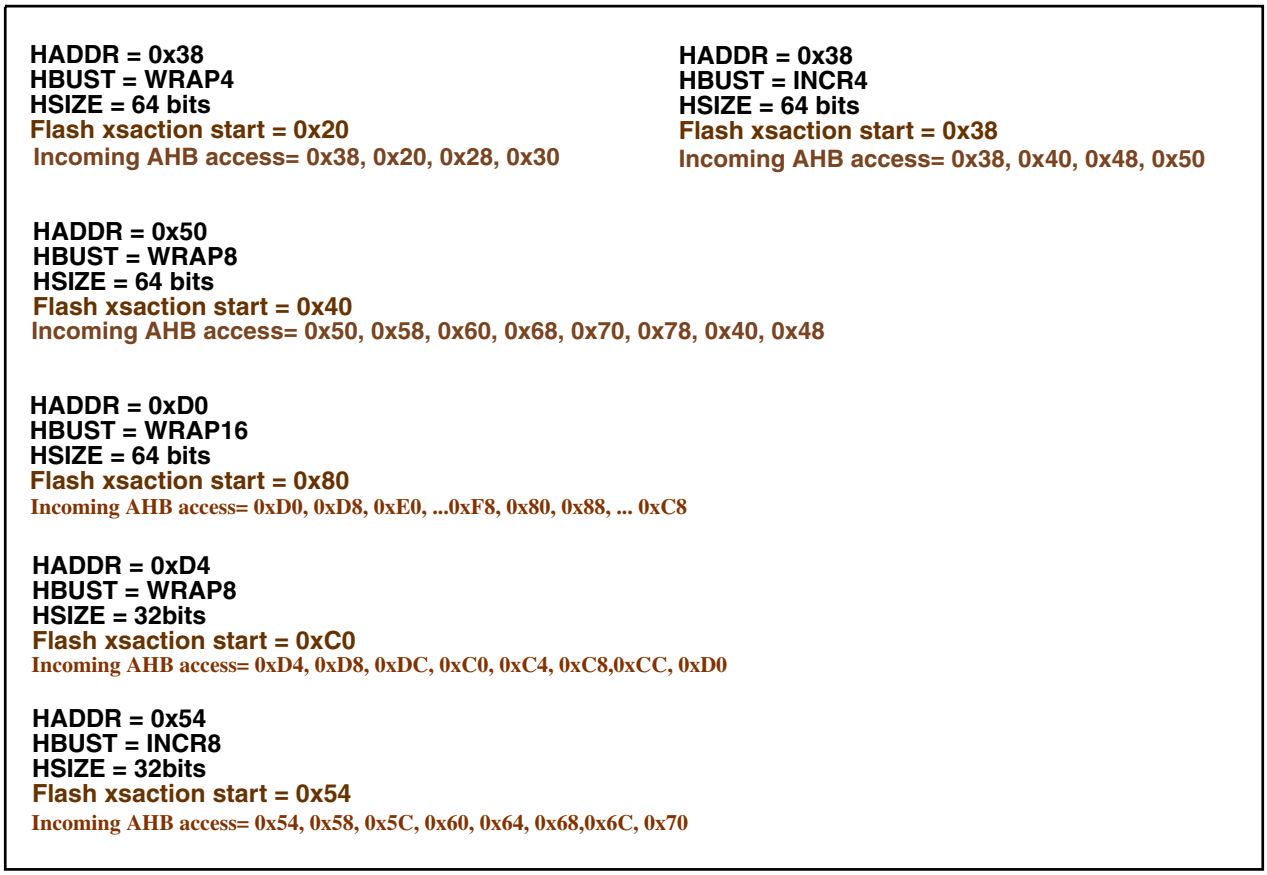

Figure 606. QuadSPI HBURST support

NOTE

The software must take care that the prefetch size should never be set less than the minimum data needed by any external interface to start processing.

NOTE

Whenever a core accesses QuadSPI memory with cache enabled, the prefetch size must be configured as equal or more than the cache line size; otherwise, FR[AIBSEF] error appears.

80.4.2.5 LUT

The LUT consists of a number of pre-programmed sequences. Each sequence is basically a sequence of instruction-operand pairs, which when executed sequentially, generate a valid serial flash memory transaction. Each sequence can have a maximum of 10 instruction-operand pairs. The LUT can hold a maximum of 16 sequences. The figure below shows the basic structure of the sequence in the LUT.

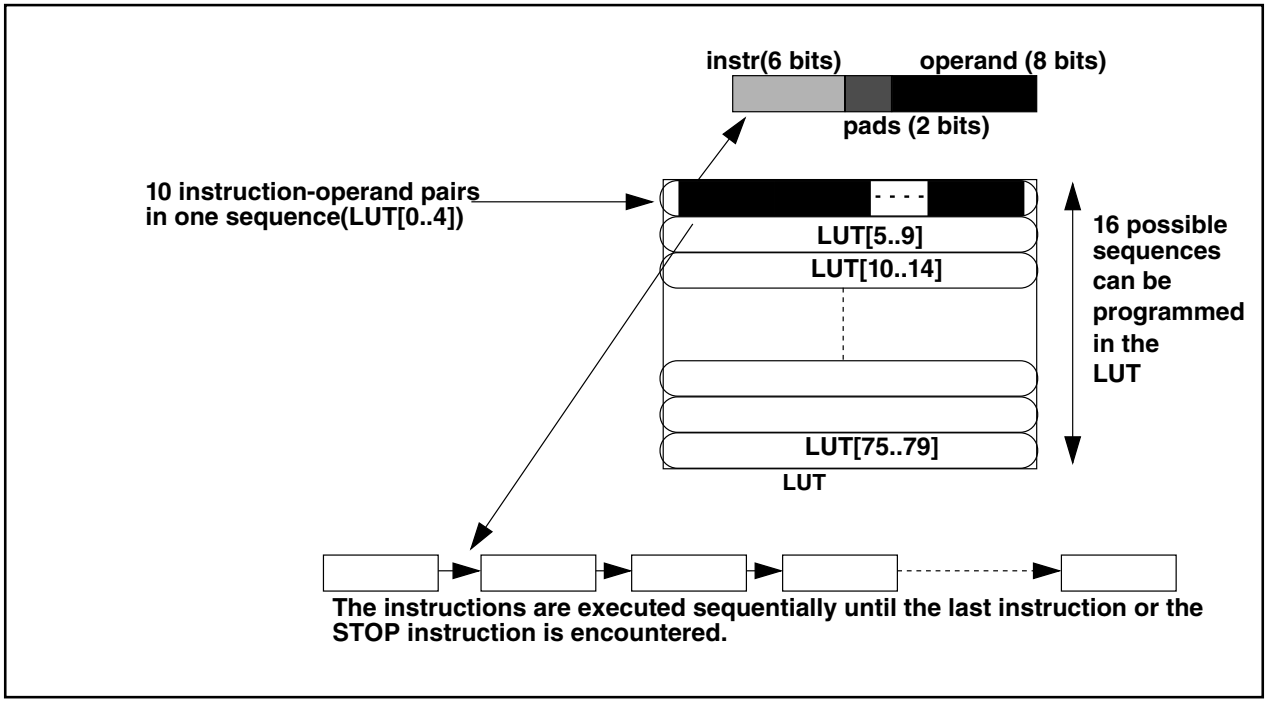

Figure 607. LUT and sequence structure

At reset, the index 0 of the LUT[0..4] is programmed with a basic read sequence as described in Reset sequence. After reset, the complete LUT may be reprogrammed according to the chip connected on board. To protect its contents, during a code runover, the LUT might be locked, after which a write to the LUT will not be successful until it has been unlocked again. The key for locking or unlocking the LUT is 5AF05AF0h, and the associated processes are as follows:

Locking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b01 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued). A successful write to this register locks the LUT.

Unlocking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b10 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued in between). A successful write to this register unlocks the LUT.

The lock status of the LUT can be read from the LCKCR[UNLOCK] and LCKCR[LOCK] fields.

Some example sequences are defined in Example sequences. After reset the instruction sequence 0 is populated with the default read sequence shown in the table below.

Table 692. Reset sequence

Instruction	Pad	Operand	Comment
CMD	0h	3h	Read data byte command on one pad
ADDR	0h	18h	24 address bits to be sent on one pad

Table continues on the next page...

Table 692. Reset sequence (continued)

Instruction	Pad	Operand	Comment
READ	0h	8h	Read 64 bits
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.4.2.6 Issuing SFM commands

Each access to the external device follows this sequence:

1. You must pre-populate the LUT with the serial flash memory command sequences that are required for the flash memory device being used.
2. The module executes the instructions in this sequence one by one. The transaction starts and the module configures the value of SR[BUSY].
3. Communication with the external serial flash memory device starts and the transaction executes.
4. After the transaction is complete (all transmit and receive operations with the external serial flash memory device are complete), the module resets SR[BUSY]. In case of an IP command, FR[TFF] is asserted.

For details, see Flash memory programming and Flash memory read.

You can trigger the processing of SFM commands in the QuadSPI module in one of the following ways:

Using IP commands

For IP commands, the required components need to be written into the following registers and in this sequence:

1. Write the serial flash memory address to be used as provided in the Serial Flash Address Register (SFAR). For IP commands not related to specific addresses, the base address of the related flash memory needs to be programmed. For example, for an instruction which does not require an address (that is, write enable instruction), the SFAR should be programmed with the base address of the memory the command is to be sent to.
2. Write the sequence ID and data size details in the IP Configuration Register (IPCR).
3. Note that writing a value to IPCR[SEQID] must be the last step of the sequence. It is possible to combine all the fields of the IPCR into one single write. See IP Configuration Register (IPCR) for details.

Using AHB commands

Any AHB memory-mapped access is routed to one of the buffers depending on the master ID of the request. If the access is a "miss," a new serial flash memory transaction is initiated. The transaction is based on the sequence pointed to by BFGENCR[SEQID] as described in Flexible read xAHB buffers.

An AHB access is considered memory mapped when the access is to the memory-mapped serial flash memories, as described in Memory Mapped Serial Flash Data - Individual Flash mode on Flash memory A.

80.4.2.7 Flash memory programming

In all NOR Flash devices memory sector to be written needs to be erased first. The programming sequence is then initiated in the following way:

1. Program the FRAD and MDAD registers.
2. Program the address related to the command in SFAR (with access attributes programmed in MDAD). If required, write the desired value to SFACR[CAS], otherwise write 0 to it. Also, write 1 to SFACR[WA] if the serial flash memory is a word addressable flash memory, or write 0 in case serial flash memory is byte addressable

3. Program the IPCR register (with access attributes programmed in MDAD). IPCR[SEQID] should point to an index of the LUT that has the flash memory program sequence pre-programmed. Write an appropriate value to IPCR[IDATSZ] to denote the size of the write in bytes.
4. Check FSM Status (FSMSTAT) register to know status of current transaction. Valid[31] bit should be '1' and domain ID [11:8] should match the ID with which SFAR and IPCR were written. Program the TX watermark in TBCT[WMRK] field and wait for STAT[1:0] bits to turn '01'.
5. Check that the TX buffer is empty. If you need to discard the data present in the TX buffer (SR[TXEDA]) field is set, then the TX buffer must be cleared by writing 1 to MCR[CLR_TXF].
6. Provide data for the program command into the circular buffer through the TBDR. Once the TX buffer is written till watermark level and SR[TXWA] flag is de-asserted this IP command will be triggered. FSMSTAT[STAT] will get set to 10.
7. Repeat step 3, depending on the amount of data required, until all of the required data is written to the TBDR. SR[TXFULL] can be used to check if the buffer is ready to receive more data. At any time, TBSR[TRCTR] can be read to check how many words have been written into the TX buffer.
8. Once the transaction completes FSMSTAT[VLD] bit will set to 0, SR[BUSY] is reset and FR[TFF] is asserted. Please refer to section Secure flash programming for more details.

After writing to IPCR[SEQID] , the module starts executing the programmed sequence when QuadSPI SFM is IDLE. The software ensures that the correct sequence is programmed into the LUT in accordance with the flash memory connected to the module. The data is fetched from the TX buffer. It consists of 256 entries of 32-bit sizes and is organized as a circular FIFO, the read pointer for which is incremented after each fetch. When all the data is transmitted, the QuadSPI module returns from the busy state to the idle state. However, this is not true for the external device because the internal programming is still ongoing. You may monitor the relevant status information available from the serial flash memory device and ensure that the programming is done appropriately.

80.4.2.8 Flash memory read

Host access to the data stored in the external serial flash memory device is performed in two steps. First, the data must be read into the internal buffers and in the second step, these internal buffers can be read by the host.

Reading serial flash memory data into the QuadSPImodule internal buffers

A read access to the external serial flash memory device can be triggered in two different ways:

- IP command read: For reading flash memory data into the RX buffer, you must provide the correct sequence ID in IPCR[SEQID]. The sequence ID points to a sequence in the LUT. The software needs to ensure that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. You must program the SFAR , SFACR[CAS], and IPCRs. All available read commands supported by the external serial flash memory are possible.

  Optionally, it is possible to clear the RX buffer pointer prior to triggering the IP command by writing a 1 to MCR[CLR_RXF]. This will invalidate the data currently present in the RX buffer and any new read data will overwrite the old one.

  Using these inputs, the complete transaction is built when IPCR[SEQID] is written to and if MDAD checks are passing (based on the access attributes while writing SFAR and IPCR). The transaction related to the read access starts when QuadSPI is IDLE and FSMSTAT[VLD] bit is 1. The data is fetched for the domain ID that is shown in FSMSTAT[11:8] bits when FSMSTAT[STAT] is set to 11 and the requested number of bytes is fetched from the external serial flash memory device into the RX buffer. As the read access is triggered by an IP command, the value of both SR[IP_ACC] and SR[BUSY] is set to 1.. A count of the number of entries currently in the Rx buffer can be obtained from RBSR[RDBFL].

  Communication with the external serial flash memory stops if the specified number of bytes are read (on successful completion of the transaction).

  NOTE

  In case of external DQS strobe based sampling, read data size (IDATSZ or LUT size) must be in multiples of 8 bytes.

- AHB command read: For reading flash memory data into the AHB buffer, you must:

- Set up a read access by a master to the address range in the system memory map, which the external serial flash memory devices are mapped to.
- Write a desired value to SFACR[CAS], if required, or write 0 to the field.
- Program the buffer registers corresponding to the AHB master initiating the request,and this depends on the configuration of RBCT[RXBRD].
- Provide the correct sequence ID in the BFGENCR. The software ensures that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. Flash memory device selection and access mode are determined by the address accessed in the AHB address space associated with the QuadSPI module (see Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

On each AHB read access to the memory mapped area, the valid data in the AHB buffer is checked against the address requested in the actual read. When the AHB read request cannot be served from the content of the AHB buffer, the buffer is flushed and the controller executes the sequence pointed to by the sequence ID. The requested number of buffer entries defined in BUFxCR[ADATSZ] is then fetched from the external serial flash memory device into the internal AHB buffer. As the read access is triggered through the AHB bus, the value of SR[AHB_ACC] is set, driving SR[BUSY] in turn, until the transaction is complete. Communication with the external serial flash memory stops when the specified number of entries is filled.

Data transfer from the QuadSPI module internal buffers

The data read out from the external serial flash memory device by the QuadSPI module is stored in the internal buffers. The means of accessing the data from the buffer differs depending on which buffer the data is loaded to. See Block diagram for details on the two available buffers, the RX buffer and the AHB buffer, in this module. The buffer appears transparent to you and is non-memory mapped. See the "Flexible AHB Buffer" section for details.

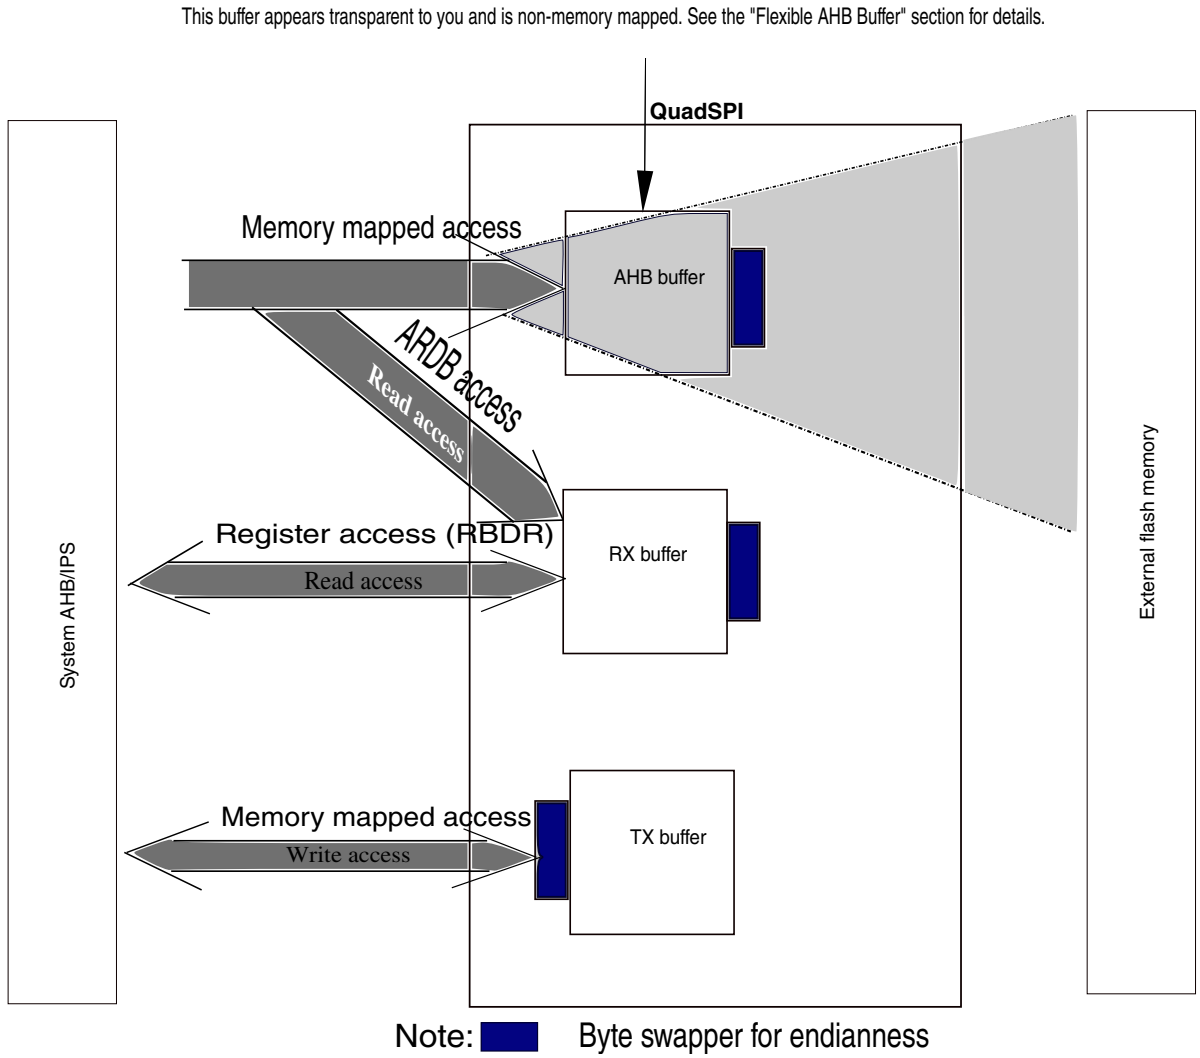

Figure 608. QuadSPI memory map

The RX buffer is implemented as FIFO of depth 32 entries of 4 bytes. Its content is accessible in two different address areas, both referring to identical data and the same physical memory:

- In the IPS address space in the area associated with RX Buffer Data Register (RBDR0 - RBDR31).
- In the AHB address space in the area associated with AHB RX Data Buffer Register (ARDB0 - ARDB31).Two successive entries are accessed with one single 64-bit AHB read operation.

The RX buffer operation can be summarized as follows:

- RBCT[WMRK] determines at which fill level SR[RXWE] is asserted and how many entries are removed from the RX buffer on each buffer POP operation.
- SR[RXWE] indicates that the configured number of data entries is available in the RX buffer and RBSR[RDBFL] indicates how many valid entries are available in total.
- The first entry (RBDR0 or ARDB0) always corresponds to the first valid entry in the RX buffer.

For details, see RX Buffer Data Register (RBDR0 - RBDR31) and AHB RX Data Buffer Register (ARDB0 - ARDB31).

- Flag-based data read of the RX buffer is performed by polling SR[RXWE]. When it is asserted, the valid entries can be read either via the IPS address space (RBDRn) or the AHB address space (ARDBn). A buffer POP operation must be

triggered by the application by writing a 1 to FR[RBDF]. This automatically updates the FIFO to point to the next entry as defined by RBCT[WMRK]. For example, if WMRK is set to 3, then the buffer discards 16 bytes of data.

- DMA-controlled data read of the RX buffer is performed by using the DMA module. The application must ensure that the DMA controller of the related chip is programmed appropriately, as described in DMA usage.
- DMA-controlled read out is triggered fully automatically by the assertion of SR[RXWE]. The related buffer POP operation is also handled completely inside the QuadSPI module. As in the case explained here, accessing the RX buffer content either on RBDRn or ARDBn related addresses is equivalent.
- AHB buffer data read via memory-mapped access: This kind of access is performed by reading one of the addresses assigned to the external serial flash memory device(s) within the range specified in Table 730. If this is not the case, a memory-mapped AHB command read is triggered as described above. If the requested data is already available in the AHB buffer, it is provided directly to the host.

When an AHB access is made to the flash memory mapped address, the data is fetched and returned to the AHB interface. The AHB interface is stalled until the data is fetched. As soon as the data from the requested address is read by the QuadSPI module, the AHB read access is served. Therefore, it is possible to run sequential reads from the AHB buffer at arbitrary speed without the need to monitor any information about the availability of the data. Nevertheless, this access scheme stalls the AHB bus for the time required to read the data from the serial flash memory device. If you know that the access is sequential, a better way is to have a prefetch enabled by programming the value of BUFxCR[ADATSZ] so that the data is fetched into the buffer before the next sequential AHB access.

As long as the host restricts its accesses to the data present in the buffer and to the data currently fetched from the serial flash memory, it is possible to run the host read from the AHB buffer simultaneously with the serial flash memory read into the AHB buffer.

80.4.2.9 AHB write

This module supports a single master AHB write with these burst types — INCR4, INCR8, INCR16, and INCR unspecified 4n bytes and single 4n bytes — and these burst types are supported with all Hsizes. An AHB write transaction size can be expressed in multiples of 4 bytes, and a single transaction must have a minimum of 4 bytes. In case of HyperRAM ,this limitation of minimum 4 bytes is not present. Also unspecified INCR and single transactions are supported without the limitation of 4n bytes in case of HyperRAM.

The following restrictions apply to the QuadSPI module with respect to AHB write transactions:

- AHB transactions of WRAP* types are not supported. For these unsupported access types, the controller returns an error response and does not initiate any flash memory transaction.
- Back to back, fixed address AHB write is not supported.
- Early burst termination is not supported for AHB transactions.

The QuadSPI controller queues back-to-back AHB writes with continuous address and sends them in a single flash memory transaction. However, in case the AHB address of a burst is not in continuous addressing sequence to previous write burst, a new flash memory transaction is initiated.

Following is the programming sequence for an AHB write:

1. Check that SR[BUSY] is deasserted or is 0 and check that the TX buffer is empty. If there is any residue data present in the TX buffer(SR[TXNE]), the buffer must be cleared by writing '1'1 to MCR[CLR_TXF].
2. Based on the type of flash memory device that is used for page programming, AWRCR[PPW_WR_DIS] and AWRCR[PPW_RD_DIS] need to be programmed.

   The default reset value for both the fields is 0 and allows writing to flash memory device assuming a very low T_{pp} (page program wait time) period. This period is very high for most of the flash memory devices. After any write to a flash memory device, the module waits for the write to finish before proceeding further.

   This is controlled by the AWRCR[PPW_WR_DIS] and AWRCR[PPW_RD_DIS] field configurations.
3. Program the BFGENCR[SEQID] to point to the LUT where flash memory write sequence is stored.

4. AHB write master can now enable the transactions to be written to the flash memory. The AHB master must ensure data throughout to avoid underflow.
5. When a flash memory write completes and flash memory CS is deasserted, the software must poll SR[BUSY] for the deasserted value, which is 0. This indicates that the AHB write is complete. In case an underflow has occurred, flash memory CS is deasserted with (SR[TXNE])to know that an AHB write is pending with some residue data in the TX buffer.
6. Whenever flash memory CS is deasserted after an AHB write sequence, FR[PPWF] is set if any of AWRCR[PPW_RD/WR_DIS] is enabled. FR[PPWF] disables any further flash memory read/write based on AWRCR[PPW_RD]/AWRCR[WR_DIS]. After FR[PPWF] is set, it returns every incoming AHB transaction with an error response.
7. The software must clear FR[PPWF] to resume AHB transactions after the expiry of T_{pp} period of flash memory. It can also send IPS read command to the flash memory for checking if T_{pp} is over.
8. The software must ensure that the correct read and write LUT sequences are selected corresponding to the AHB read and write transactions. QuadSPI would malfunction if flash memory read sequence is selected during AHB write or vice versa.

NOTE

An AHB error response occurs in case of AHB write if flash is not able to consume data at the rate master is writing in TX FIFO and TX FIFO eventually becomes full

80.4.2.10 Byte ordering of serial flash memory read data

The basic scheme is that the first byte read out of the serial flash memory device, which is addressed by SFAR[SFADR], corresponds to RBDR0[31:24] for IP command read. Similarly, to send a single byte it should be positioned in TBDR[0:7]. In contrast to that for AHB command read, the bytes are always positioned according to the byte ordering of the AHB bus.

- Byte ordering in individual flash memory mode

  The following table provides the byte ordering scheme of how the byte oriented data space of the serial flash memory device is mapped into one single 32-bit entry of the RX buffer or the AHB buffer. The table is valid within the following context:

  — Flash memory A in individual flash memory mode

  — All AHB data read commands with 32-bit access size

Table 693. Byte ordering in individual flash memory mode

Serial flash memory byte numbering	3	2	1	0
Buffer entry bit position [31:0] (32-bit data width)	[31:24]	[23:16]	[15:8]	[7:0]

NOTE

For IP commands, the read size can be specified as number of bytes. If this number is not a multiple of four, then the last buffer entry is not completely filled with the missing higher numbered bytes at undefined values.

  For AHB commands and reads, starting from an address not aligned to 32-bit boundaries, the requested bytes are given at the appropriate positions according to the AMBA AHB specification.

- Buffer entry ordering for 64-bit read access

  For read access via the AHB interface, a 64-bit access is possible. Each 64-bit access reads two 32-bit entries, simultaneously. The ordering of these 32-bit entries within the 64-bit word is provided in the following table.

Table 694. 64-bit read access buffer entry ordering

AHB read data bit position [63:0]	[63:32]	[31:0]
Buffer entry #	Odd (1, 3, 5, ...)	Even (0, 2, 4, ...)

80.4.2.11 Normal mode interrupt and DMA requests

The QuadSPI module has different flags that can only generate interrupt requests and one flag that can generate an interrupt as well as DMA requests. The following table lists the eight conditions. Note that the flags mentioned in the table are associated with the Flag Register (FR).

Table 695. Interrupt and DMA request conditions

Condition	Flag (FR)	DMA
Data learn pattern failure	DLPFF	-
TX buffer fill	TBFF	-
TX buffer underrun	TBUF	-
Illegal instruction error	ILLINE	-
RX buffer drain	RBDF	X
RX buffer overflow	RBOF	-
AHB buffer overflow	ABOF	-
AHB sequence error	ABSEF	-
AHB illegal transaction error	AITEF	-
AHB illegal burst size error	AIBSEF	-
IP command trigger could not be executed error	IPIEF	-
IP command related transaction finished	TFF	-

Each condition has a corresponding field in Flag Register (FR) and a request enable field in DMA Request Select and Enable Register (RSER). FR[RBDF] has separate enable fields for generating IRQ and DMA requests. Note that not all the fields have an individual IRQ line. See the chip's Interrupt Vector table for details.

- Transmit buffer fill interrupt request

  This indicates that the TX buffer can accept new data. The buffer is asserted if FR[TBFF] is asserted and if the value of the corresponding enable field, RSER[TBFIE], is 1. See TX buffer Operation for details on the assertion of FR[TBFF].

  Apart from IRQ, it is possible to handle the TX buffer fill by using the DMA. If the value of RSER[TBFDE] is 1, a DMA request is triggered when the number of available space in the TX buffer is more than the TBCT[WMRK] valid entries and value of SR[TXWA] is set. The application must configure the environment appropriately (for example, the DMA controller) for the DMA transfer.

  In SFP Enabled configurations, program RSER[TBFDE] bit to 1 only when arbitration is won and TBDR access is unlocked after checking STATE field of FSMSTAT register. After TBDR programming is completed by DMA, reset this bit otherwise, QuadSPI SFM state will remain busy and no further IPS accesses can be served by that Target queue.

- Receive buffer drain interrupt or DMA request

  This is derived from FR[RBDF], indicating that the RX buffer of the QuadSPI module has data available from the serial flash memory device to be read by the host. It remains set as long as RBSR[RXWE] is configured. Also, RSER[RBDIE] enables the related IRQ.

  Apart from the IRQ, it is possible to handle the RX buffer drain by using the DMA. If the value of RSER[RBDDE] is 1, a DMA request is triggered when the RX buffer contains more than RBCT[WMRK] valid entries. The application must set the environment appropriately (for example, the DMA controller) for the DMA transfers.

- Buffer overflow/underrun interrupt request

This is a combination of the following fields (all located in the Flag Register (FR) with the related enable bits in the DMA Request Select and Enable Register (RSER)):

- TBUF - TX buffer underrun, enabled by TBUIE
- RBOF - RX buffer overflow, enabled by RBOIE
- ABOF - AHB buffer overflow, enabled by ABOIE
- The transmit buffer underrun indicates that an underrun condition in the TX buffer has occurred. It is generated when a write instruction is triggered whilst the TX buffer is empty and the value of RSER[TBUIE] is 1.
- The receive buffer overflow indicates that an overflow condition in the RX buffer has occurred. It is generated when the RX buffer is full, an additional read transfer attempts to write into the RX buffer, and the value of RSER[RBOIE] is 1.
- The AHB buffer overflow indicates that an overflow condition in the AHB buffer has occurred. It is generated when the AHB buffer is full, an additional read transfer attempts to write into the AHB buffer and the value of RSER[ABOIE] is 1.
- The data from the transfers that generated the individual overflow conditions is ignored.

- Serial flash memory command error interrupt request
- Transaction finished interrupt request

  The IP command transaction finished IRQ indicates the completion of the current IP command. It is triggered by FR[TFF] and is masked by RSER[TFIE].

80.4.2.12 TX buffer operation

The TX buffer provides the data used for page programming. For proper operation, it is required to provide at least one entry in the TX buffer prior to starting the execution of the page programming command. The application must ensure that the required number of data bytes is written into the TX buffer fast enough as long as the command is executed without a TX buffer overflow or underrun.

The QuadSPI module sets the FR[TBFF] field as long as the TX buffer is not full and can accept more data. At the end of write through TX buffer, you must clear FR[TBFF] to avoid unnecessary last TX buffer fill interrupt. However, there would always be a pending request asserted from QuadSPI controller at the end of any DMA transfer. When external DMA finishes transfer iteration, this request from QuadSPI is kept asserted for the next iteration loop.

NOTE

Even if the generation of DMA requests for filling the TX buffer is disabled by using RSER[TBFDE], the TX buffer still accepts a DMA transfer because of the last asserted pending request.

Disabling of DMA transfer should be controlled by an external DMA master.

When the QuadSPI module tries to pull data out of an empty TX buffer, FR[TBUB] signals the TX buffer underrun. The TX buffer underrun flag is also asserted when the TX buffer contains less than 32-bits of data and the QuadSPI module tries to pull out data from it. The current IP command leading to the underrun condition is continued until the specified number of bytes is sent to the serial flash memory device. Also, the data that is transferred is in the Fs format. This means, after the underrun flag is set under this condition, it returns Fs until the required number of bytes are not sent. This has been done to ensure that the software does not erase the whole sector after underrun and just reprogramming from failure point serves the purpose. When this sequence command is complete, FR[TBFF] is asserted, indicating that the TX buffer is ready to be written again.

The TX buffer overflow is not signaled explicitly, but TBSR[TRBFL] can monitor the TX buffer fill level.

For more information, see TX Buffer Status Register (TBSR) and Flag Register (FR).

80.4.2.13 Address scheme

Earlier, serial flash memories supported only a 24-bit address space, restricting the maximum memory size of the serial flash memory to 16 MB. The new memory specification supports two types of 32-bit addressing mode in addition to the legacy 24-bit address mode. It also supports segregation of address programmed into Row address and Column address of the flash memory, as per the requirement.

Extended address mode

In this mode, the legacy 24-bit commands are converted to accept 32-bit address commands. The flash memory needs to be configured for the 32-bit address mode. Also, while programming the LUT sequence in QuadSPI for 32-bit mode, the ADDR and ADDR_DDR commands should be programmed with 32d as the operand value with SFACR[CAS] programmed to 0. If a flash memory needs some bits of the address as its column address, then it must be considered that a total of 12 bits are required by the flash memory; however, the number of bits should not exceed 32 because the maximum address supported by QuadSPI is 32 bits.. Each of the memory vendors have a different way of enabling this mode (see the memory specification from memory vendors). For example, the command B7h sent to the Macronix flash memory enables it for the 32-bit address mode.

Extended address register

In this mode, the upper 8 bits of the 32-bit register are provided by the Extended address register in the memory, which provides a specific register that is updated according to the address to be accessed. This effectively converts the legacy 24-bit address command into 32-bit address commands. The memories greater in size than 16 MB consist of banks of 16 MB each. The 8 bits occupied in the extended address register effectively enable a bank. For example, in Spansion memory, when the extended address register is updated with a value of 1h, with the help of the 17h command, it opens Bank1 of the memory. The consequent 24-bit address commands lead to Bank1. The extended address register needs to be updated with the respective value for access to other banks. This effectively converts the legacy 24-bit address command into 32-bit address commands.

Separation of address into rows and columns

This mode has been introduced for flash memories that need addresses segregated into rows and columns. The value in SFACR[CAS] defines the width of the column address required by a flash memory. The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions, if the value of SFACR[CAS] is 0. Otherwise, the actual address takes CAS into consideration. If the value of SFACR[CAS] is 3, then bits 26-3 of the programmed address are sent to the flash memory as its page address. This is in case the flash memory is operating in a 24-bit mode and bits 2-0 are sent as its column address. If a flash memory requirement for column address is less than the number of pads in which address has to be sent, then QuadSPI appends the remaining bits by 0. You must program the operand value in CADDR and CADDR_DDR command accordingly. It must be ensured that the total number of address bits requested by flash memory as its page and column address must not be more than 32 bits.

Word addressable mode for flash memory

This mode has been introduced for flash memories, which have a word-addressable memory. This means, each address of the flash memory contains one word (two bytes) of data. The value of SFACR [WA] is configured to 1 to enter this mode. QuadSPI internally divides the incoming address in the AHB bus or the address in the SFAR to map it to a valid flash memory location. For example, if the incoming address is 2004h, the controller re-maps this address to access the flash memory location 1002h. If not in this mode, the incoming address 2004h is mapped to flash memory location 2004h.

80.4.3 Module Disable mode

Module Disable mode is a block-specific mode that the QuadSPI can enter to disable serial flash memory clock and AHB command. This mode can be entered by:

- The host software: by writing a '1' to MCR[MDIS]

Below are the condition that must be fulfilled to enter the Module Disable mode:

- SR[BUSY] = 0
- SR[AHBTRN] = 0
- RBSR[RDBFL] = 0
- SR[RXDMA] = 0
- SR[TXDMA] = 0
- None of the flags in FR are enabled as interrupts is set

The conditions mentioned above ensures the following:

- There is no SFM command currently being executed.
- All the data read into the RX buffer from the serial flash memory have been fetched by the application.

- There is no current AHB access.
- There is no active DMA request.
- There is no enabled interrupt that is pending.

Certain read or write operations have a different effect when the QuadSPI is in the Module Disable mode. In the Module Disable mode, not all of the status and flag bits of the QuadSPI module are updated, and writing to them has no effect. Interrupt and DMA request signals cannot be cleared while in the Module Disable mode.

NOTE

It is illegal to issue a new SFM command starting two clock cycles prior to raising the request of entering the Module Disable mode until the QuadSPI stays in this mode.

80.4.4 Leaving Module Disable mode

In the Module Disable mode, the serial flash memory clock and AHB command to the QuadSPI module are switched off.

After the QuadSPI has left this mode and has returned to Normal mode, the execution of the first SFM command is deferred until the clock to drive that part of the module related to the serial flash memory device is available. Depending upon the point in time when the first SFM command is triggered, the actual execution of the command starts with a delay, respective with the re-enabling of the flash memory clock signal.

80.4.5 HyperRAM support

QuadSPI supports HyperRAM memories, and by virtue of this protocol, QuadSPI supports the following functionalities.

- Bidirectional data strobe/read write data strobe (RWDS)
  - If QuadSPI is configured to use the HyperRAM mode, the RWDS pad should be pulled down.
- Variable refresh latency
  - If the value of MCR[VAR_LAT_EN] is 1, based on the status of RWDS from HyperRAM during the command/address phase, QuadSPI includes an additional initial access latency. If RWDS is high, QuadSPI includes twice + 1 the latency mentioned in the dummy phase. If RWDS is low, latency mentioned in the dummy phase is not included.
  - If the value of MCR[VAR_LAT_EN] is not set, fixed latency mentioned in the dummy phase is included.
- Read data strobe to latch data from HyperRAM
- Programming considerations for HyperRAM support:
  - Data masking during the AHB write is enabled when MCR[DQS_OUT_EN] bit is programmed as ’1’.
  - It is suggested that while using Hyper RAM program the SPTRCLR[PREFETCH_DIS] bit as ‘1’ so that every time a new AHB read transaction starts it reads new data from external memory instead of reading the data already stored in AHB buffers. This will ensure that the data read back after an AHB write is not a stale data.
  - AHB write doesn’t supports wrap transactions (WRAP4, WRAP8, WRAP16) even with HyperRAM.
  - If there is multiple switching between AHB read and write transactions then software should program AWRCR[AWTRGLVL] cautiously. It should ensure that during AHB write the data written to memory is more than the AWRCR[AWTRGLVL] programmed before switching over to AHB read transactions. This will ensure that IP is not left waiting for sufficient write data to be collected.

80.5 Initialization/application information

This section provides the initialization and application information of the QuadSPI module.

80.5.1 Power up and reset

The serial flash memory devices connected to the QuadSPI module might require special voltage characteristics of their inputs during power up or reset. The application must ensure this.

CAUTION

Erase or program commands should be completed before issuing a reset or power cycle to avoid corrupted flash pages. The application shall ensure there is a backup of critical data stored at a different location to enable recovery from corrupted flash pages.

Example: Flash reset sequence

Use the following sequence to reset flash A:

1. Make sure that the flash supports a reset for the condition CS#=high and IOF[3]=low.
2. Set MCR[SWRSTSD] and MCR[SWRSTHD] fields and then clear them.
3. Set MCR[MDIS] field.
4. Reset MCR[ISD3FA] field for flash A.
5. Clear MCR[MDIS] field.
6. Set MCR[MDIS] field.
7. Set MCR[ISD3FA] field for flash A.
8. Clear MCR[MDIS] field.

80.5.2 Available status/flag information

This section provides an overview of the different flags and statuses available, and their interdependencies for different use cases. The SR and FR are the related registers.

80.5.2.1 IP commands

See IP Configuration Register (IPCR) for additional details not explicitly covered in this paragraph.

- IP commands—normal operation

  Writing to IPCR[SEQID] triggers the execution of a new IP command. Given that this is a legal command, SR[IPACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts.

  After the instruction on the serial flash memory device is complete, these field deassert and FR[TFF] is configured.

- IP commands—error situations

  See Overview_of_Error_Flags for details.

80.5.2.2 AHB commands

See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic in theFlash Memory Read section for details.

- AHB commands—normal operation

  Memory-mapped read access to a serial flash memory address not contained in the AHB buffer triggers the execution of an AHB command. Given that this is a legal command, SR[AHB_ACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts. After the instruction on the serial flash memory device is complete, these fields are deasserted.

- IP commands—error situations

  See Overview of FR error flags for details.

80.5.2.3 SFM commands

An SFM command consists of an instruction code and all other parameters (for example, size or mode bytes) needed for that specific instruction code. Triggering a command either initiates a transaction on the external serial flash memory or results in an error. See Table 696 for details on errors.

80.5.2.4 Overview of error flags

The following table provides an overview of the different error flags in the FR and additional error-related details.

Table 696. Overview of FR error flags

Error category	Error flag in FR	Command execution on serial flash memory device TFF behavior (in case of IP commands only)	Description
AHB error flag	ABOF	Flash memory transaction continues until it finishes	Set when the module tries to push data into the AHB buffer that exceeds the size of the AHB buffer. Occurs only because of the wrong programming of BUFxCR[ADATSZ].
AHB error flag	AIBSEF	Flash memory transaction is aborted	Total burst size of the AHB transaction is greater than prefetch data size.
AHB error flag	AITEF	Flash memory transaction is aborted	No response is generated from QuadSPI to AHB bus in case of illegal transaction. Also, the watchdog timer expires.
Miscellaneous error flag	DLPFF	Flash memory transaction continues until it finishes	Set when the DATA_LEARN instruction is encountered in a sequence but no sampling point is found for the data learning pattern.
Miscellaneous error flag	ILLINE	Flash memory transaction aborted	Illegal instruction error flag - set when an illegal instruction is encountered by the controller in any of the sequences.
Command arbitration error	IPIEF	TFF not asserted in conjunction with that command	IP command error - caused when IP access is currently in progress (IP_ACC is set) and during: • Write attempt to RBCT register
Buffer-related error	RBOF	TFF is asserted on completion	• RX buffer overrun
Buffer-related error	TBUF	TFF is asserted on completion	• TX buffer underrun

Note that only the buffer-related errors are associated with a transaction on the external serial flash memory. All the other errors do not trigger an actual transaction.

80.5.2.5 IP bus and AHB access command collisions

There are following flags related to this topic: FR[IPIEF]. See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic of the Flash Memory read section for a description of the flags.

80.5.3 Flash memory device selection

Regardless of the SFM command (IP or AHB), the access mode is selected by specifying the 32-bit address value for the following SFM command.

For IP commands, the access mode is selected with the address programmed into the SFAR register. See Serial Flash Address Register (SFAR) for details.

For AHB commands, the access mode is determined by the memory-mapped address. See AMBA Bus Register Memory Map for details.

80.5.4 DMA usage

For a complete description of the DMA module, see the related DMA Controller chapter. This section only provides QuadSPI-specific DMA usage details.

80.5.4.1 DMA usage in normal mode

80.5.4.1.1 Bandwidth considerations

Careful consideration of the throughput rate of the entire chain (serial flash memory -> AHB bus / IP bus -> DMA controller) involved in the read/write data process is essential for a proper operation. Such analysis must take into account not only the data rate provided by the serial flash memory but also the data rate of the AHB bus and the performance of the DMA controller in reading/writing data from/to the RX/TX buffer.

Two figures must match for a proper operation, which means that the data rate provided by the serial flash memory device must not exceed the average RX buffer readout data rate. Otherwise, the longer this state persists, it results into an RX buffer overflow. Similarly, the data consumed by the serial flash memory device must not exceed the average TX buffer fill rate. If this persists, it leads to an underrun.

AHB bus side (data read)

The total number of bus cycles for each DMA minor loop completion is added from the following components:

The following table provides certain examples for typical use cases:

Case 1: DMA needs to read 4 bytes from SRAM and provide to QuadSPI. It costs total four bus clock cycles. Then, DMA handshake adds additional six bus clock cycles, resulting in a total of [6 + 4 * (32/4) = 38] bus clock cycles.

Table 697. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 60 MHz bus clock frequency
3	16	6+(16/4)*4 = 22	~366ns
7	32	6+(32/4)*4 = 38	~633ns
11	48	6+(48/4)*4 = 54	~900ns
15	64	6+(64/4)*4 = 70	~1166ns

Case 2: DMA needs to read 32 bytes from SRAM and provide to QuadSPI. DMA handshake takes an additional six bus cycles, with 32 bytes DMA read from SRAM costs (8 + 3) core clock cycles. DMA writes 32 bytes to QuadSPI, takes 2 * (32/4) = 16 bus cycles with one additional CPU access to QuadSPI, costing two bus clock cycles. This results in a total 6 + (8+3)/2 + 2 * (32/4) +2 = 30 bus clock cycles.

Table 698. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop >	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	6 + (4+3) /2 + (16/4)*2 + 2 = 20	~333ns
7	32	6 + (8+3) /2 + (32/4)*2 + 2 = 30	~500ns
11	48	6 + (4+3)/2*3 + (48/4)*2 + 2 = 44	~733ns
15	64	6 + (8+3) + (64/4)*2 + 2 = 51	~810ns

NOTE

This table figure represents an ideal scenario; actual performance depends on how the chip integrates DMA and QuadSPI modules.

Serial flash memory device side (data read)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles is required to read 4 bytes, corresponding to one RX buffer entry (setup of command and address not considered): , two cycles for the Octal DDR mode in the individual flash memory mode, eight cycles for quad mode (SDR) instructions in individual flash memory mode, and so on.
- Overhead because of clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of RBCT[WMRK]:

Table 699. Access duration examples for serial flash memory side

RBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx for 80 MHz SCKFx		Time duration of flash memory data readout for 80 MHz SCKFx (~12.5ns period)	
		IFM [2] quad	IFM quad DDR	IFM quad	IFM quad DDR
0	4	8	4	~100ns	~50ns
1	8	16	8	~200ns	~100ns
3	16	32	16	~400ns	~200ns
7	32	64	32	~800ns	~400ns
11	48	96	48	~1200ns	~600ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Individual flash memory mode

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

A complementary example is when the watermark is set to be too high. In such a case, the time taken by the DMA to read out the RX buffer entries should be lesser than the time taken by the controller to push in the remaining entries in the buffer.

IPS bus side (data write)

The total number of bus cycles for each DMA minor loop completion are added from the following components:

- Overhead for each minor loop, given by DMA controller: assume 10 cycles
- Overhead because to clock domain crossing: assume two cycles
- Number of bus clock cycles required for 16 bytes (128-bit write size): assume four cycles (read/write sequence of DMA controller)

Note that the size of the minor loop is determined by the size of TBCT[WMRK]; therefore, the overhead specified above distributes among (TBCT[WMRK]+1) write accesses of 32-bit each.

The following table provides some examples for typical use cases:

Table 700. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop [1]	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	12+4 = 16	~200ns
7	32	12+8 = 20	~250ns

1. DMA loop refers to one minor loop completion that is equivalent to one.

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

Serial flash memory device side (data write)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles required to write 16 bytes, corresponding to four TX buffer entry (setup of command and address not considered): Eight cycles for Octal DDR mode instructions in individual flash memory mode, 32 cycles for quad SDR writes in individual flash memory mode.
- Overhead due to clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of TBCT[WMRK]:

Table 701. Access duration examples for serial flash memory side

TBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx		Time duration for consuming data at flash memory interface 100 MHz SCKFx (10 ns period)[2]		Time for FIFO to get empty[3]	
		IFM [4] quad	IFM octal DDR	IFM quad	IFM octal DDR	IFM quad	IFM octal DDR
3	16	32	8	320ns	80ns	2240ns	560ns
7	32	64	16	640ns	160ns	1920ns	480ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Not all flash memory devices support writes at 100 MH. See the flash memory data sheet for the actual page program frequency supported.
3. The assumption for these timings is that the TX Fifo is full when the transaction is initiated
4. Individual flash memory mode

NOTE

The tables mentioned above are only examples which must be correlated with the DMA in the system.

Considering the examples provided in the two tables above for TX FIFO, it is evident that depending on the relationship between the bus clock and serial flash memory clock frequencies, there are settings possible where the serial flash memory consumes data faster than the IPS bus can write data in TX buffer. In these cases, a TX buffer underrun situation occurs. To avoid TX buffer underrun, the data transaction size should be large enough.

80.5.5 Flash memory devices address mapping

QuadSPI is configured in Single mode for the supported flash memory port A

The sizes of the flash memory devices are mapped with the system memory space based on the configurations of the following registers:

- SFA1AD
- SFA2AD

The total memory region for the flash memory devices is mapped between QuadSPI_AMBA_BASE and TOP_ADDR_MEMA2 such that the corresponding CS is asserted based on SFA1AD and SFA2AD register configurations.

80.5.5.1 Single mode

For single-die flash memories, you must write the same value to SFA2AD register that you write to the SFA1AD register.

Following is a programming example for single mode single-die flash memory:

- QuadSPI_AMBA_BASE - 1000_0000h
- SFA1AD[TPADA1] - 2000_0000h
- SFA2AD[TPADA2] - 2000_0000h

The following figure illustrates the memory mapping for single mode QuadSPI configuration.

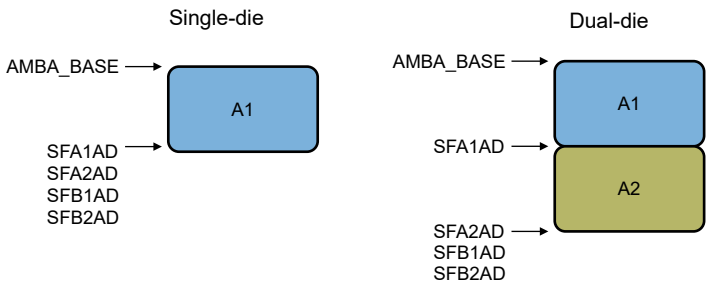

Figure 609. Memory map for Single mode

80.6 Byte ordering – endianness

The following topics show the byte ordering in 64-bit LE configuration for AHB buffer and 32-bit LE for TX/RX buffer.

80.6.1 Programming flash memory data

CPU writes instructions to the TBDR register, such as:

- Write TBDR: 4_03_02_01h
- Write TBDR: 8_07_06_05h

The following table shows the content against each TX buffer entry.

Table 702. Example of QuadSPI TX buffer

TX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

Programming the TX buffer into the external serial flash memory device results in the following byte order to be sent to the serial flash memory:

- 01...02...03...04...05...06...07...08

80.6.2 Reading flash memory data into the RX buffer

Reading the content from the same address provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 703. Resulting RX buffer content

RX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

80.6.2.1 Readout of the RX buffer through RBDRn

The RX buffer content appears at CPU read access through the peripheral bus interface in the following order:

- Read RBDR0: 4_03_02_01h
- Read RBDR1: 8_07_06_05h

80.6.2.2 Readout of the RX buffer through ARDBn

The RX buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit access: Read ARDB0: 4_03_02_01h
- 32-bit access: Read ARDB1: 8_07_06_05h
- 64-bit access: Read ARDB0: 8_07_06_05_04_03_02_01h

80.6.3 Reading flash memory data into the AHB buffer

Reading the content from the same address as it was written to provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 704. Resulting AHB buffer content

AHB buffer entry	Content
0	8_07_06_05_04_03_02_01h

80.6.3.1 Readout of the AHB buffer through memory-mapped read

The AHB buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit read access: 4_03_02_01h
- 32-bit read access: 8_07_06_05h
- 64-bit read access: 8_07_06_05_04_03_02_01h

80.7 Driving flash memory control signals in single and dual modes

In single and dual modes, the serial flash memory devices that can connect to the QuadSPI module expect additional control signals on the inputs, which are connected to IOFA[3], IOFA[2] in the quad mode. For easy interfacing, the outputs IOFA[3:2] for flash memory A are driven to the logic state given by the configuration fields MCR[ISD3FA], MCR[ISD2FA].

These outputs are driven all the time to the logic level programmed in the MCR except the time when quad commands of the serial flash memory are executed. See the specifications of the related serial flash memory device for details about the inactive level.

80.8 Serial flash memory devices

Several different vendors make flash memory devices with a QuadSPI interface. At present, there is no set standard for the QuadSPI instruction set. The most common commands currently have the same instruction code for all vendors; however, some commands are unique to specific vendors. Some of the example sequences are provided in the following sections.

80.8.1 Example sequences

This section provides the example sequences of the QuadSPI module.

Table 705. Exit 4 x I/O read enhance performance mode (XIP) (Macronix) and read status

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xIO read command
ADDR	2h	18h	24-bit address to be sent on four pads
MODE	2h	0h	2 mode cycles (exit XIP)
DUMMY	2h	4h	4 dummy cycles
READ	2h	8h	Read 64 bits
CMD	0h	5h	Read Status register
READ	0h	1h	Status register data
STOP	0h	0h	Stop, instruction over

80.8.1.1 Read command (hyperflash memory/HyperRAM)

This section provides the read command sequences (hyperflash memory/HyperRAM) of the QuadSPI module.

Table 706. Read command (hyperflash memory/HyperRAM)

Instruction	Pad	Operand	Comment
CMD_DDR	3h	A0h	Read command with continuous burst type
ADDR_DDR	3h	18h	24-bit row address

Table continues on the next page...

Table 706. Read command (hyperflash memory/HyperRAM) (continued)

CADDR_DDR	3h	10h	16-bit column address with lower 3 bits valid and rest 0
Dummy	3h	0hF	15 dummy cycles
READ_DDR	3h	4h	32-bit data read on 8 pads
STOP	3h	0h	Stop, instruction over

Hyperflash memory/HyperRAM is a word addressable flash memory. This means that each address accesses a word-wide (two-byte) data value. The software should ensure that when Hyperflash memory/HyperRAM is connected to the controller, the value of SFACR[WA] must be 1. With this value, the controller remaps a byte addressable access to a word addressable access.

80.8.1.2 Read status register (hyperflash memory/HyperRAM)

This section provides details related to the read status register of the QuadSPI module.

Table 707. Read status register (hyperflash memory/HyperRAM)

Instruction	Instruction sequence	Pad	Operand	Description
CMD_DDR	Read Pre Command	3h	0h	Write command with wrapped burst type
ADDR_DDR		3h	18h	24-bit row address (0000AAh)
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits valid and rest 0(0005h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	70h	Write data to be sent to flash memory as pre-command
CMD_DDR	Command phase (fourth/final chip select phase)	3h	A0h	Read command with continuous burst type
ADDR_DDR		3h	18h	24-bit row address
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits as valid and rest 0
DUMMY		3h	0hF	15 dummy cycles
READ_DDR		3h	4h	32-bit data read on 8 pads
STOP		3h	0h	Stop, instruction over

80.8.1.3 Word program (hyperflash memory/HyperRAM)

This section provides the word program (hyperflash memory/HyperRAM) of the QuadSPI module.

Table 708. Word program (hyperflash memory/HyperRAM)

Instruction	Instruction sequence	Pad	Operand	Description
CMD_DDR	Unlock sequence 1 (first chip select phase)	3h	0h	Write command with wrapped burst type
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	AAh	8-bit address AAh treated as command
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits valid and rest 0(0005h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	AAh	Write data to be sent to flash memory as pre-command
CMD_DDR	Unlock sequence 2 (second chip select phase)	3h	0h	Write command with wrapped burst type
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	55h	8-bit address 55h treated as command
CADDR_DDR		3h	10h	16-bit column address with lower 3-bits valid and rest 0(0002h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	55h	Write data to be sent to flash memory as pre-command
CMD_DDR	Program setup phase (third chip select phase)	3h	0h	Write command with wrapped burst type
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	0h	8-bit address 00h treated as command

Table continues on the next page...

Table 708. Word program (hyperflash memory/HyperRAM) (continued)

CMD_DDR		3h	AAh	8-bit address AAh treated as command
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits valid and rest 0(0005h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	A0h	Write data to be sent to flash memory as pre-command
CMD_DDR	Command phase (fourth/final chip select phase)	3h	0h	Write command with wrapped burst type
ADDR_DDR		3h	18h	24-bit row address
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits as valid and rest as 0
WRITE_DDR		3h	2h	2-byte data written on 8 pads (D1D2)
STOP		3h	0h	Stop, instruction over

80.8.1.4 Fast read sequence (Macronix/Numonyx/Spansion/Winbond)

The following table shows the fast read sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 709. Fast read sequence

Instruction	Pad	Operand	Description
CMD	0h	Bh	Fast read command = 0Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	0h	8h	Eight dummy cycles
READ	0h	4h	Read 32 bits on one pad
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.8.1.5 Fast dual I/O DT read sequence (Macronix)

The following table shows the fast dual I/O DT read sequence for Macronix flash memories.

Table 710. Fast dual I/O DT read sequence

Instruction	Pad	Operand	Description
CMD	0h	BDh	Fast dual I/O DT read command = BDh
ADDR_DDR	1h	18h	24 address bits to be sent on two pads in the DDR mode
MODE4_DDR	1h	0h	P2=P0 or P3=P1 is necessary. See the Macronix data sheet for details. One clock cycle for mode.
DUMMY	1h	6h	Six dummy cycles
READ_DDR	1h	4h	Read 32 bits on two pads in the DDR mode
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.8.1.6 Fast read quad output (Winbond)

The following table shows the fast read quad output sequence for Winbond memories

Table 711. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad output command = 6Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	2h	8h	Eight dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.8.1.7 4 x I/O read enhance performance mode (XIP) (Macronix)

The following table shows the 4 x I/O read enhance performance mode for Macronix flash memories. The enhanced performance mode is also known as XIP mode.

Table 712. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xI/O read command = EBh

Table continues on the next page...

Table 712. Fast read quad output sequence (continued)

Instruction	Pad	Operand	Description
ADDR	2h	18h	24 address bits to be sent on four pads
MODE	2h	A5h	Two mode cycles
DUMMY	2h	4h	Four dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	1h	Jump to instruction 1 (ADDR)

When in XIP mode, the software must ensure that all the flash memories connected to the controller are in this mode. As a part of initializing the controller, all the flash memories might be enabled with XIP by carrying out dummy reads.

80.8.1.8 Dual command page program (Numonyx)

The following table shows the dual command page program sequence for Numonyx flash memories.

Table 713. Dual command page program sequence

Instruction	Pad	Operand	Description
CMD	1h	2h	Dual command page program = 02h on 2 pads
ADDR	1h	18h	24 address bits to be sent on two pads
WRITE	1h	20h	Write 32 bytes on two pads
STOP	0h	0h	Stop, instruction over

80.8.1.9 Sector erase (Macronix/Numonyx/Spansion)

The following table shows the Sector erase sequence for the Macronix/Numonyx/Spansion flash memories.

Table 714. Sector erase sequence

Instruction	Pad	Operand	Description
CMD	0h	20h	Sector erase command = 20h
ADDR	0h	18h	24 address bits to be sent on one pad
STOP	0h	0h	Stop, instruction over

80.8.1.10 Read status register (Macronix/Numonyx/Spansion/Winbond)

The following table shows the read status register sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 715. Read status register sequence

Instruction	Pad	Operand	Description
CMD	0h	0h5	Read status register command = 05h
READ	0h	0h1	Read status register data
STOP	0h	0h	Stop, instruction over

80.8.1.11 Data learn instruction sequence

The following table shows the data learn sequence for 4 I/O flash memory.

Table 716. Data learn instruction sequence (4 I/O)

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad command = 6Bh
ADDR_DDR	2h	18h	24 address bits in the DDR mode to be sent on four pads
DUMMY	2h	8h	8-cycle dummy
DATA_LEARN	2h	1h	1-byte data learn
READ_DDR	2h	6h	Read 6 bytes in 4 pads[1]
JMP_ON_CS	0h	0h	Jump to Inst 0 (CMD)

1. Data learn instruction needs to be followed by a read DDR instruction of minimum 6 bytes in case of 4 I/O mode.

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

The following table shows the data learn sequence for 8 I/O (hyperflash memory) flash memory.

Table 717. Data learn instruction sequence (8 I/O)

Instruction	Pad	Operand	Description
CMD_DDR	3h	AOh	Read command for hyperflash memory
ADDR_DDR	3h	18h	24-bit row address[1]
CADDR_DDR	3h	10h	16-bit column address
DUMMY	3h	Fh	15-cycle dummy
DATA_LEARN	3h	1h	1-byte data learn
READ_DDR	3h	Ch	Read 12 bytes in 8 pads[2]
STOP	3h	0h	Stop, instruction over

1. The address needs to be aligned, which means, no latency should be there between the RWDS edges.
2. The data learn instruction needs to be followed by a read DDR instruction of minimum 12 bytes in case of 8 I/O mode.

The following table shows the data learn sequence for 4 I/O flash memory.

Table 718. Data learn instruction sequence (4 I/O)

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad command = 6Bh
ADDR_DDR	2h	18h	24 address bits in DDR mode to be sent on four pads
DUMMY	2h	8h	8 dummy cycles
DATA_LEARN	2h	1h	1-byte data learn
READ_DDR	2h	6h	Read 6 bytes in 4 pads
JMP_ON_CS	0h	0h	Jump to Inst 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

The following table shows the data learn sequence for 8 I/O (Hyperflash) flash memory.

Table 719. Data learn instruction sequence (8 I/O)

Instruction	Pad	Operand	Description
CMD_DDR	3h	AOh	Read command for hyperflash memory
ADDR_DDR	3h	18h	24-bit row address[1]
CADDR_DDR	3h	10h	16-bit column address
DUMMY	3h	Fh	15-cycle dummy
DATA_LEARN	3h	1h	1-byte data learn
READ_DDR	3h	8h	Read 8 bytes in 8 pads
STOP	3h	0h	Stop, instruction over

1. The address needs to be aligned, which means, no latency should be there between the RWDS edges.

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.9 Sampling of serial flash memory input data

80.9.1 Basic description

QuadSPI is used to read data from the serial flash memory device. Depending on the actual implementation, there is a delay between the internal clocking in the QuadSPI module and the external serial flash memory device. See the following figure for an overview of this scheme.

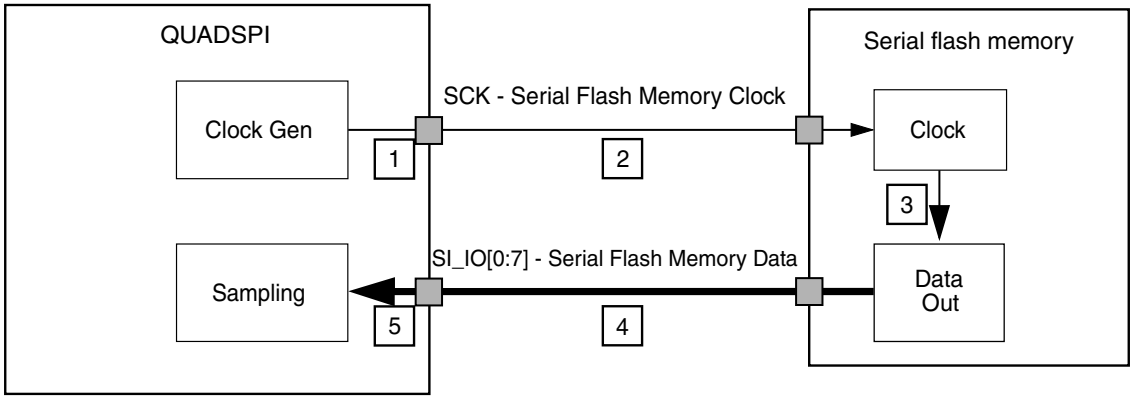

Figure 610. Serial flash memory sampling clock overview

The rising edge of the internal reference clock is taken as timing reference for the data output of the serial flash memory. After a time of t_{total_delay} the data arrives at the internal sampling stage of the QuadSPI module. Considering the figure provided here, the following parts of the delay chain contribute to t_{total_delay}:

- Output delay of the serial flash memory clock output of the device containing the QuadSPI module
- Wire delay of application/PCB from the device containing the QuadSPI module to the external serial flash memory device
- Clock to data out delay of the external serial flash memory device, including input and output delays
- Wire delay of application/PCB from the external serial flash memory device to the device containing the QuadSPI module
- Device delay corresponding to the input data

NOTE

The t_{total_delay} is specific to the characteristics of the actual implementation.

80.9.2 DQS sampling method

80.9.2.1 Basic description

In the DQS mode, the data strobe signal (DQS/RWDS) is used to sample the read data. Here, both DQS and the data sent by the flash memory move in the same direction; therefore, it is relatively easier to achieve at higher frequencies.

When using DQS for SDR reads, QuadSPI internally samples the incoming data on the rising edge of the strobe signal.

The next figure shows the sampling read data in the SDR mode using the DQS.

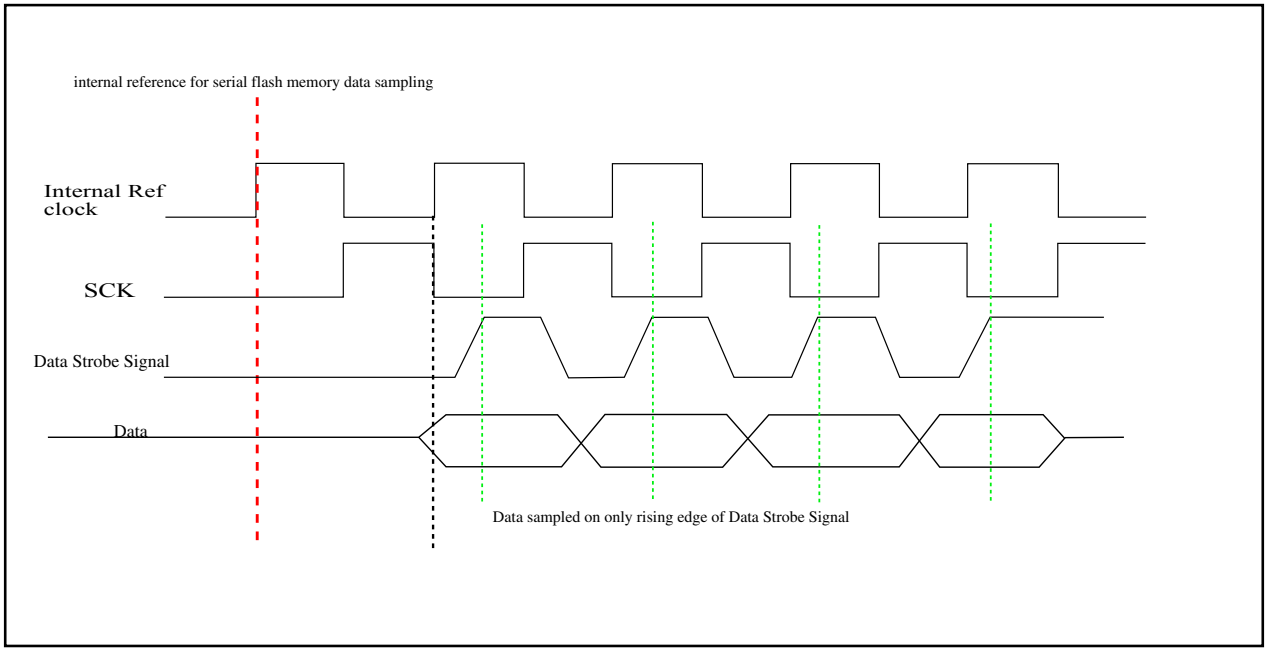

Figure 611. Data strobe functionality in SDR mode for read operation.

NOTE

Consider "Data Strobe Signal" as "Data Strobe Signal driven by memory" and "Data" as "Data from memory".

NOTE

Refer to the Datasheet for specific timing waveforms of QuadSPI

When using the DQS for DDR reads, QuadSPI internally samples the incoming data on both the edges of the strobe signal. See the next figure for details.

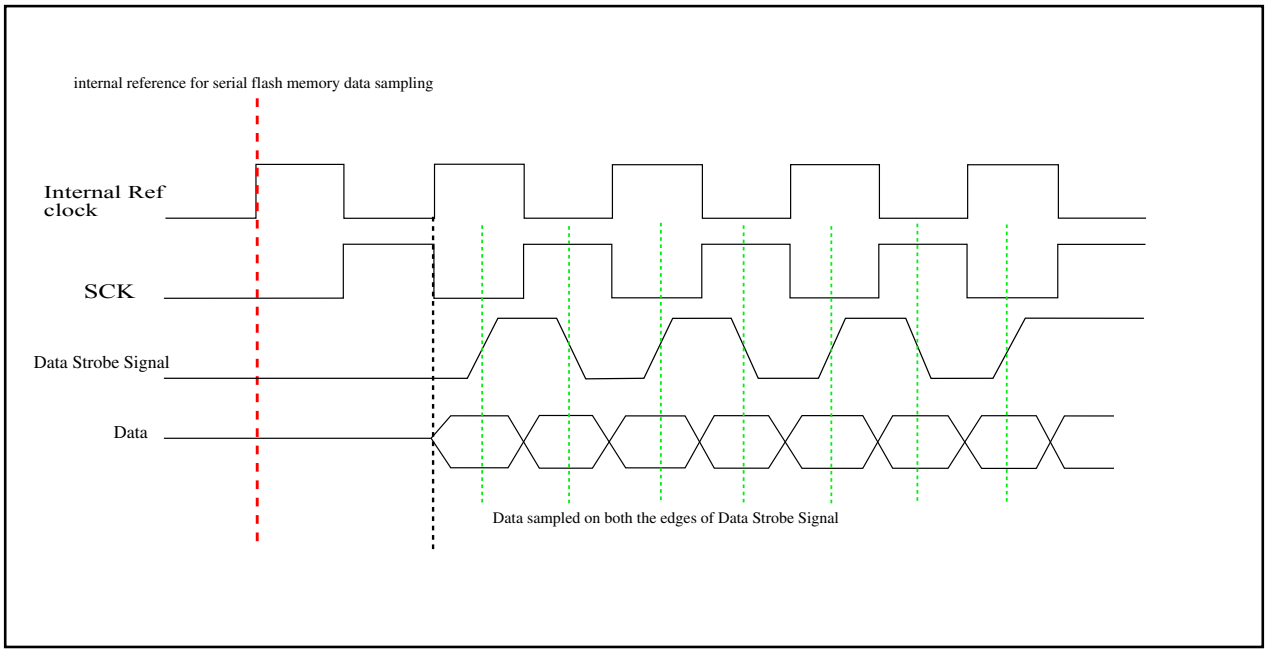

Figure 612. Data strobe functionality in DDR mode for read operation.

NOTE

Consider "Data Strobe Signal" as "Data Strobe Signal driven by memory" and "Data" as "Data from memory".

NOTE

For Specific details - Refer to the Data Sheet specification of QuadSPI module.

80.9.2.2 External DQS

In serial flash memories supporting DQS, the data strobe signal is an output from the flash memory device that indicates when data is being transferred from the flash memory to the host controller. The data is then captured by the controller on:

- Only one edge (either rising or falling edge) of DQS signal in the SDR mode
- Both rising/falling edges of the DQS signal in the DDR mode

This can be enabled by programming MCR[DQS_FA_SEL] = "11" for flash memory A. This mode supports the following configuration:

- Both high/low frequency delay chain manual programming using DLLCRA[SLV_DLY_COARSE] and DLLCRA[SLV_FLINE_OFFSET]
- DLL-assisted sampling only using and DLLCRB[DLLEN]
- DLL-assisted auto data learning using and DLLCRB[DLLEN] along with MCR{DLPEN]
- should be disabled as DLL is used

NOTE

This mode may not be available on the chip. See the "Supported read modes" section in the chip-specific QuadSPI information for the read modes that this chip supports.

80.9.2.3 Dummy Pad loopback

The internal clock is loop-backed from the dummy internal pad to compensate data pad delays. This can be enabled by configuring the value of MCR[DQS_FA_SEL] as "01" for flash memory A. This mode can be used with the following configuration:

- High/low frequency delay chain manual programming in bypass mode using DLLCRA[SLV_DLY_COARSE] and DLLCR[FREQEN].
- DLL-assisted sampling only using DLLCRA[DLLEN]

NOTE

Refer to DS or "Chip-specific section" of QSPI for Fixed sampling Tap specific settings/details with out without DLL (in bypass mode)

- DLL-assisted auto data learning using DLLCRA[DLLEN] and along with MCR[DLPEN]

NOTE

Refer to Auto-DataLearning (4x Sampling method) section with DLL for further details

NOTE

This mode may not be available on the chip. See the "Supported read modes" section in the chip-specific QuadSPI information for the read modes that this chip supports.

80.10 Data learning

80.10.1 Basic description

Data learning is used to manage varying data valid windows from the flash memory as well as any variations in the chip based on PVT conditions in the DDR mode. QuadSPI provides this feature via the DATA_LEARN instruction for all flash memories, irrespective of whether the flash memory supports it. The DATA_LEARN instruction accepts an operand that defines the number of bits of the known pattern for which the data learning has to be done. The known pattern is provided in the DLPR register.

QuadSPI supports the following data learning:

- QuadSPI supports data learning with DLL enabled only

The following sections explain data learning in detail.

80.10.2 DQS sampling method

The semi-automatic data learning is supported in the DQS sampling method. To start data learning:

1. Configure a known pattern in the Data Learn register inside flash memories that support data learning. The pattern should be selected to have multiple low and high transitions in the data bus.

   NOTE

   Certain flash memories provide data learning as a feature for DDR data reads.

2. Set up a QuadSPI DDR data read sequence, inserting a DATA_LEARN instruction before the READ_DDR instruction. The flash memory returns the data learning pattern in between dummy cycles in every read command. Each I/O gives the same DLP value for every clock edge.

   NOTE

   For flash memories that *do not* support data learning, configure a known location in flash memory with a known pattern. The pattern should not have 0h or FFh included. The pattern should be selected to have multiple low and high transitions in the data bus. Set up a QuadSPI DDR data read sequence, inserting a DATA_LEARN instruction. The address in the SFAR register should point to the known location within the pattern. Configure the known pattern in DLPR[DLPV]. See Programming the data learning pattern in flash memory for details on how the data has to be ordered in memory for correct operation.

3. Select a sampling point. See chip-specific QuadSPI information for selection of the sampling point.
4. Initiate the read via a peripheral transaction.
5. QuadSPI reads the data from the flash memory. It then encounters the DATA_LEARN instruction and samples the incoming data on both edges (rising and falling) of the DQS.

   NOTE

   If the data from the flash memory does not match the data learning pattern, the FR[DLPFF] flag is set. The QuadSPI module reports no sampling point automatically.

6. Repeat steps 2-7 with varying VT conditions for a particular process until FR[DLPFF] is set. The sampling points where no FR[DLPFF] is set signify a valid setting.

In the case of multiple valid settings, the software should select the middle point. The sampling point should be fixed within the above selected point for the next READ transactions.

NOTE

Ensure that QuadSPI is not accessed during calibration.

This feature might be used to auto-calibrate the sampling point for DDR reads, and auto-calibration might be triggered at fixed intervals, or depending on a change in PVT conditions.In case the sampling point needs to be changed based on initiating options (such as, DLL lock status, time period, or software forced interrupt), data learn instruction has to be re-initiated.

The following figure shows data learning in DQS mode.

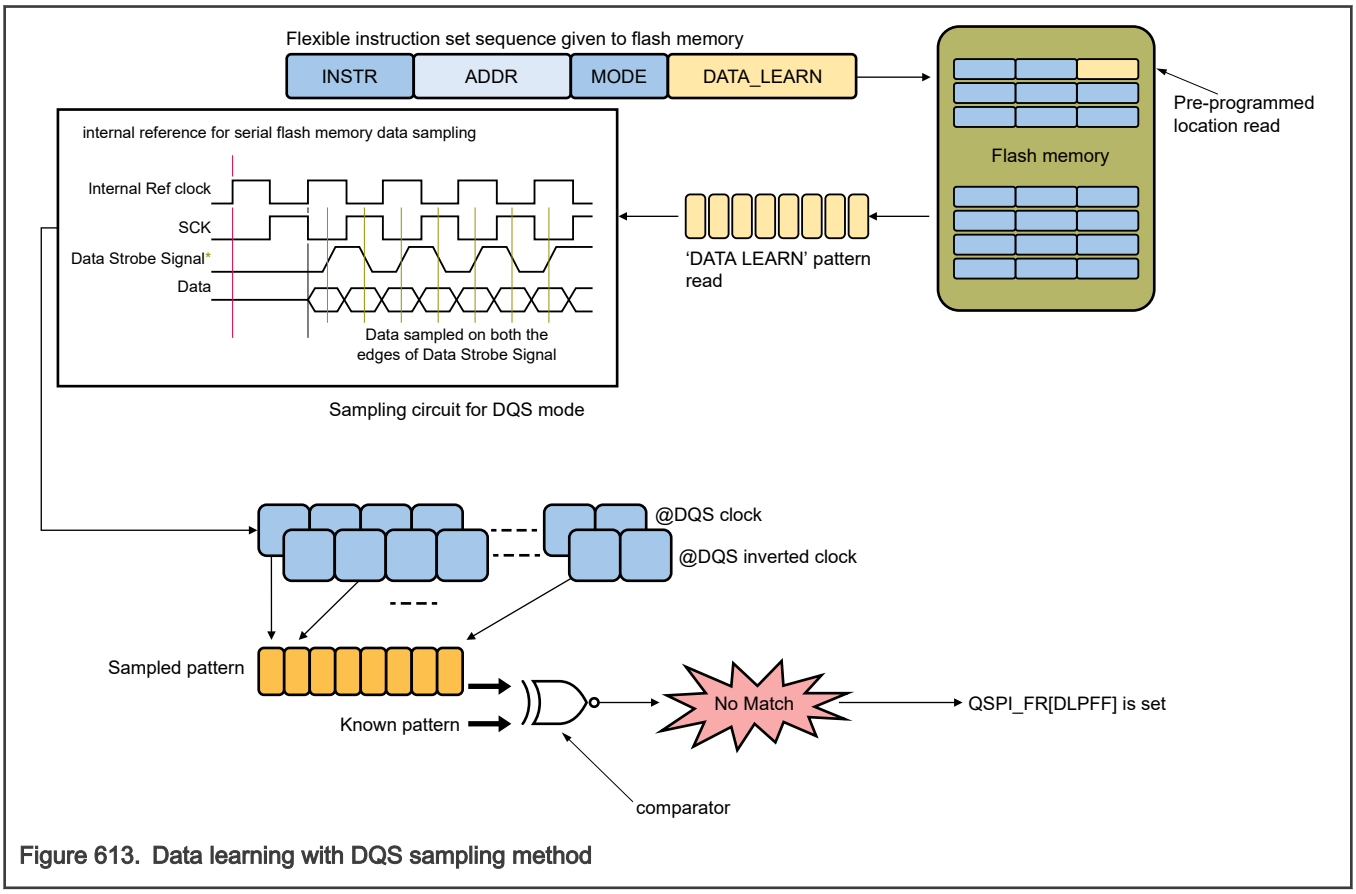

Figure 613. Data learning with DQS sampling method

NOTE

This mode might not be available on the chip. See the chip-specific QuadSPI information for the read modes that this chip supports.

80.10.3 Programming the data learning pattern in flash memory

Example scenario: If the value of DLPR[DLPV] is 43h, QuadSPI controller tries to match the sequence of bits sent on selected data lines with the pattern in DLPR[DLPV]. The following table shows the data programmed in flash memory with endianness taken into consideration.

Table 720. Programming the data learning pattern in flash memory

	Single Pad	Double Pad	Quad Pad	Octal Pad
DLPR IO1 pattern	0x349A	0x349A	0x3514	0x349A
DLPR IO3 pattern	NA	NA	0x349A	0x3514
Flash Pattern	0x2C59	0xF04CC226	0x0DF02D0D 0x00FFF020	0xF708f700 0xF70000FF 0x00FF0008 0x0000FFFF

80.11 DLL and delay chain usage

The DLL is a general-purpose, dynamically adaptive clock delay module. It provides the ability to select a quantized delay (in fractions of the clock period) regardless of on-chip variations such as process, voltage, and temperature (PVT). The DLL is suitable for applications where accurate delay adjustment is required, such as in case of DDR interfaces.

DLL working concept

The DLL control loop consists of a counter, reference delay line, and phase detector which operate on the ref_clock reference clock input. The reference clock (clk_ref) is fed into the reference delay line. After reset, a single delay tap is selected. A phase detector is used to detect the condition where a half shift has occurred. In addition to this, signals are generated to either increment or decrement the counter, which controls the delay line (if the half-phase detect condition is not met). Any changes in the delay of the individual elements of the delay chain (because of PVT) automatically cause the phase detector logic to determine if a change in the counter value is required. After the half-phase shift is detected, an internal lock signal is generated, and after a lock event occurs, the slave delay chain is ready to be updated based on a triggering event.

Slave delay chain programming sequence—

Following is the programming sequence for DLL bypass mode.

1. Program DLLCRA[SLV_EN]=1, DLLCRA[SLV_DLL_BYPASS]=1, and DLLCRA[SLAVE_AUTO_UPDT]=0.
2. Program the following fields to provide the desired DQS delay for sampling: DLLCRA[SLV_FINE_OFFSET], DLLCRA[SLV_DLY_COARSE], and DLLCR[FREQEN]. See the chip-specific QuadSPI information for the supported programming settings.
3. Program DLLCRA[SLV_UPD]=1 to load these values in the slave delay chain.
4. Check the slave delay chain update status by polling DLLSR[SLVA_LOCK]=1 and clear DLLCRA[SLV_UPD] after confirming the update state.

Following is the programming sequence for DLL auto update mode.

1. Program DLLCRA[SLV_EN]=1, DLLCRA[SLV_DLL_BYPASS]=0, and DLLCRA[SLAVE_AUTO_UPDT]=1.
2. Program the DLL configuration by using DLLCRA[DLL_REFCNTR] and DLLCRA[DLLRES]. See the chip-specific QuadSPI information for the supported DLL configuration settings.
3. Program the slave settings to delay DQS by using these fields: DLLCRA[SLV_FINE_OFFSET], DLLCRA[SLV_DLY_OFFSET], and DLLCR[FREQEN]. See the chip-specific QuadSPI information for the supported settings.
4. If offset delay needs to be updated on the slave chain, program DLLCRA[SLV_UPD]=1.
5. Enable DLL by programming DLLCRA[DLLEN]=1 and reset DLLCRA[SLV_UPD]=0. Slave delay chain is updated automatically and can be checked by polling DLLSR[SLVA_LOCK]==1

80.12 Data input hold requirement of flash memory

In the DDR mode, the data is valid only for half clock cycle. It is difficult to meet the data input hold time requirement for flash memory. QuadSPI internally delays the data sent to flash memory so that it becomes easy to meet the hold requirement. The FLSHCR[TDH] is used for this purpose. If FLSHCR[TDH] is configured to 0, then the data sent to flash memory is aligned with the internal reference clock of QuadSPI. If it is 1, then the data is aligned to 2x internal reference half clock.

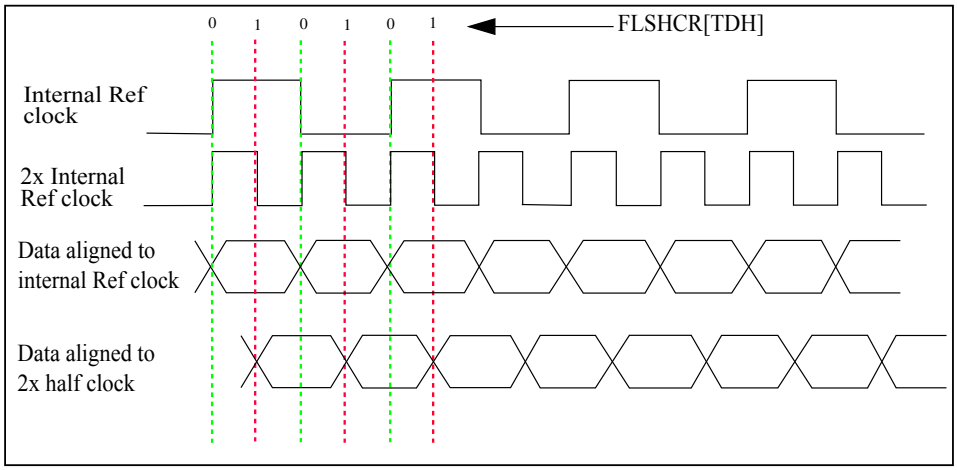

Figure 614. Data hold

80.13 Secure flash protection

This secure flash module enforces access control policies based on the MGID, privilege and secure attributes of the IPS transactions. All accesses throughout the flash device need to be monitored to determine the validity of all accesses. If transaction from a given master has appropriate access rights, it is forwarded to flash, else the access is denied, and an error is generated.

There are two level of checks present in this module, based on MDAD and FRAD descriptors programmed. First level checks the input transactions based on secure attribute and MGID associated with that transaction which are checked according to MDAD. Second level check selects the appropriate FRAD based on address range of transaction. And each FRAD allows the transaction to pass through only when secure, privilege and other MGID related attributes are matching. Else the transaction is not forwarded and IPS bus error/interrupt is generated. Flash regions can be programmed to cover the entire address space to provide a default set of access permissions. For flash read transactions only first level of check is enabled.

Software can bypass both or anyone of these checks by writing to MGC[GVLDFRAD], MGC[GVLDMDAD] and MGC[GVLD] fields.

The IPS masters should write on QuadSPI register (SFAR, IPCR and TBDR) addresses for generating transfers to flash. SFP block monitors these IPS transfers and checks if the write is being done on SFAR or IPCR registers and forwards them for MDAD and FRAD checks. If the transaction passes both checks then it is passed through to QuadSPI register else bus error or interrupt is generated. FRAD check is only done for flash write transactions not for read. Actual write on QuadSPI SFAR and IPCR register is done by SFP module only after the transaction passes MDAD and FRAD checks. There is only a single IPS slave interface which can be used for QuadSPI IPS register access and SFP IPS register access.

An IPS master transaction is secure if IPS_NONSECURE_ACCESS attribute is set to 0 for that transaction. An IPS master transaction is privileged if IPS_SUPERVISOR_ACCESS attribute is set to 1 for that transaction.

QuadSPI SFP related register sets are present here.

80.13.1 MDAD

These descriptors form the first level of checks on the input IPS transaction. There are two target group queues (TG0 and TG1) present in SFP block and each of these queues can be programmed with different set of MGAD descriptors checks in TG*n*MDAD registers. These registers are under access control and can only be programmed by privilege masters. These descriptors (one or both) should be programmed before start of any flash transaction else any IPS write on SFAR, IPCR or TBDR registers will generate an IPS bus error. After programming the target group descriptor the TG*n*MDAD[VLD] should be set to 1 for that register.

There are two target group queues (TG0 and TG1) so two transactions by different master ID can be stored inside SFP block while one of them is being processed by QuadSPI.

80.13.1.1 MDAD checks

- Secure check – This is decided by the TG*n*MDAD[SA] field of the MDAD descriptor. If the fields are set to 01 then queue is reserved for only non-secure transactions. If set to 10 then queue is reserved for only secure transactions. If the bits are set to 11 then this check is bypassed.
- MasterID check – This check compares themasterID of the input transaction with the MID match value set inTG*n*TG*n*MDAD[MIDMATCH]fields and allows only matching transactions inside the queue. There are 6 mask fields (TG*n*TG*n*MDAD[MASK]) inside the descriptor. If the mask type (TG*n*TG*n*MDAD[MASKTYPE]) is set to 0 then the input transactions master ID is ANDed with the mask bits before comparing with the MID match value. If the mask type is set to 1 then the input master ID is ORed with the masks bits and then compared with the MID match bits. Multiple master IDs can be allowed inside the queue using this mask.

When an IPS write is done to SFAR or IPCR registers then SFP block checks the attributes with MDAD descriptors of both the queues. If the attributes match with descriptor of any queue, then the value is written inside that queue and master ID is assigned to that queue. The queue is considered locked once the SEQID bits of IPCR register are written. So software should ensure that IPCR SEQID bits are written only after SFAR and other IPCR bits like DATSZ are written in that queue. The queue will be unlocked when flash transfer is completed for that transaction.

Once a master ID is assigned to a queue then transactions with only that master ID are allowed inside the queue. Any write of SFAR/IPCR is mapped to this queue even if other queue is free. So same master ID cannot have transaction on both queues at a time. The data in the queue is cleared once the flash transaction is finally completed by the QuadSPI.

The data path for input IPS writes to SFAR or IPCR registers are shown in the following figure.

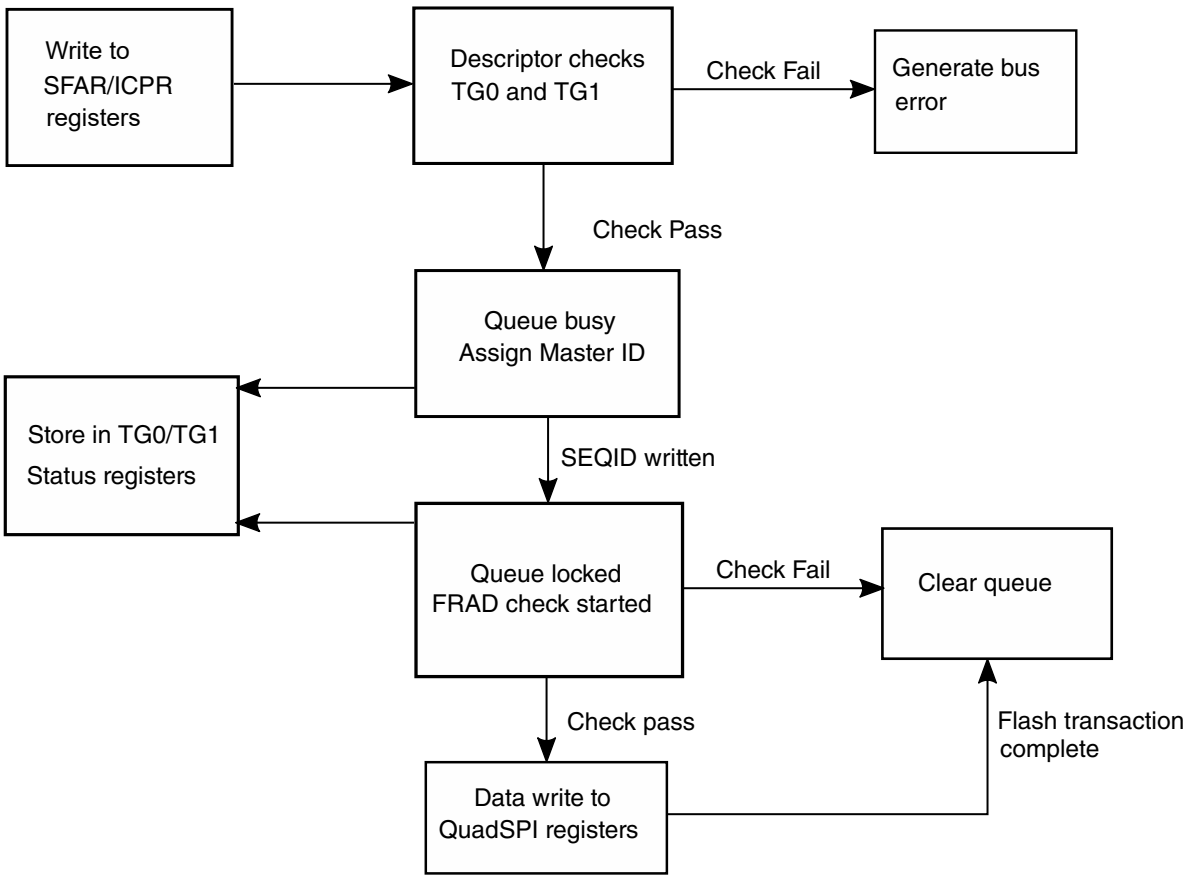

Figure 615. Data path for input IPS write to QuadSPI SFAR or IPCR registers

If the SFAR write passes first level of MDAD checks then the value is written in SFP register TG*n*SFAR and valid bit is set in TG*n*SFARS register and queue is considered as busy. Similarly when ICPR write passes the checks, its value is written into TG*n*IPRCS register and TG*n*IPRCS[VLD] field is set to 1 and queue is considered as locked. It is mandatory that IPCR is

written only after SFAR has been written for a queue and queue is busy. If IPCR is written before SFAR then it will result in IPS transfer error. Master should ensure that it completes the programming sequence for flash access request (write SFAR and IPCR with SEQID) so that target queue is not left after writing SFAR or IPCR without the SEQID. Both queues TG0 and TG1 are processed in round robin arbitration. The queue receiving the data first is processed first and next queue is processed after the first transfer completes.

NOTE

TBDR register write is not allowed until the SFAR and IPCR entries of that master has passed MDAD and FRAD checks and the transaction is queued for writing to QuadSPI. If TBDR registers are written before arbitration win, transfer error will be generated. IPS master can read FSMSTAT register to check the status of their transaction. TBDR access is allowed when FSMSTAT[VLD] field is set and for the master whose master ID matches with fields [11:8] of this register, and field [1:0] are set to 01 or 10. IPCR and SFAR registers are forwarded to QuadSPI only after the TX buffer is filled till watermark level in case of write transactions. IPCR should be written only after SFAR has been written successfully to a queue.

80.13.1.2 Error conditions

The error conditions for first level of MDAD checks and the response is given in table below. These error conditions can occur when SFAR, IPCR or TBDR registers are being written.

NOTE

Queue is considered busy if it has been written successfully once with any of the values SFAR, IDATSZ or PAR. Queue is considered locked when SEQID has been written successfully by passing MDAD checks.

Table 721. MDAD check error conditions

Error condition	Response	Common/Queue error
None of the queue descriptors are programmed	IPS transfer error is generated	Common error
Both queues are locked	IPS transfer error is generated	Common error
Both queues are busy and another master writes whose master ID is not matching with either queue.	IPS transfer error is generated.	Common error
Queue busy and same master writes SFAR or IPCR registers with wrong security attribute	IPS transfer error is generated and queue is cleared (SFAR and IPCR needs to be written again for transfer to start).	Queue error
Queue is locked and same master writes	IPS transfer error is generated	Common error
If master ID of transaction doesn't qualify MID check of any of the queues	IPS transfer error is generated	Common error
If both the queues are empty and security attribute of transaction doesn't match with any of the queues	IPS transfer error is generated	Common error
TBDR register is written before SFAR and IPCR SEQID qualifies MDAD checks	IPS transfer error is generated	-
If none of FRAD descriptors are programmed	IPS transfer error is generated	Common error

Table continues on the next page...

Table 721. MDAD check error conditions (continued)

Error condition	Response	Common/Queue error
IPCR is written before SFAR	IPS transfer error is generated	Common Error - If the transaction doesn't matches the security attribute check or MID check of any MDAD. No common or queue error - If it matches security and MID attribute of any queue.

When a common error is generated its details are latched in IPSERROR register and corresponding error field is set to 1. This register will tell if the transaction failed because of queue locked, MID mismatch or security failure along with the master ID of that transaction. This register will keep the last error transaction latched unless cleared by writing 1 to CLR bit of this register. Then from next cycle onwards this register can latch new errors. Common error will also be generated if none of the FRAD descriptors are programmed. In case a queue is busy and same master writes IPCR or SFAR with wrong security attributes the queue is cleared, the Target Group n SFAR Status (TG0SFARS - TG1SFARS) valid bit goes low. In this case the master should write the SFAR an IPCR again for proper transaction to start.

In case of queue error the details are latched in Target Group n IPCR Status (TG0IPCRS - TG1IPCRS) or Target Group n SFAR Status (TG0SFARS - TG1SFARS) registers. These registers will also keep the error status latched until cleared by writing 1 to CLR bit of respective registers.

80.13.2 FRAD

These descriptors form the second level check for IPS flash write and flash erase transactions. IPS read transaction are not processed by this level of check and are passed through after MDAD checks. There are 8 FRADs which can be programmed by privilege masters. So the access checks can be programmed for up to 8 unique address ranges. Each of the address range is equipped with different access attribute checks and based on this write access can be controlled for the flash region. These descriptors must be programmed before starting transactions on flash.

After programming the FRAD*n*_WORD0, FRAD*n*_WORD1, FRAD*n*_WORD2 and FRAD*n*_WORD3 registers, FRAD*n*_WORD3[VLD] field should be written 1. SFP block doesn't consider the FRAD descriptors which are not valid. If none of the FRAD are programmed, then error interrupt will be generated if enabled, and transaction is not forwarded to QuadSPI.

There is a descriptor lock feature to prevent spurious changes to the FRAD. FRAD*n*_WORD3[LOCK] can be programmed to make all FRAD registers as read only or to allow write access to all or some masters with specific master ID.

80.13.2.1 FRAD checks

- Address range checks – Start and end address for FRAD region are programmed in FRAD*n*_WORD0 and FRAD*n*_WORD1 registers. Start address of IPS flash transaction written in SFAR register and data size programmed in IPCR register, is used to check if the transaction lies within any of the FRAD address ranges. This address range match will be used to select the corresponding FRAD from which other access checks will be done. The start and end address are programmed around 64 KB boundary so 16 MSB are only used for range check..

  The data size should not be programmed as 0 in IPCR register for normal data transfers to flash and actual size should be programmed. In the cases where only flash instruction has to be send and no data has to be written in TBDR register, this DATSZ can be programmed as 0. In case the DATSZ is programmed as 0 in IPCR, SFP module blocks the write access to TBDR register and if any write is done then that generates IPS transfer error.

- Exclusive access lock – Exclusive master access lock can be enabled over any flash address defined under a FRAD. The master ID of the master which enables/owns the exclusive access is captured in FRAD*n*_WORD2[EALO] fields. Once enabled, the exclusive lock can be released only by the same master which enabled the lock by writing on FRAD*n*_WORD3[EAL] fields. The exclusive write access permissions of a flash region are decided as given in table below:

Table 722. Exclusive access lock

FRAD*n*_WORD3[EAL]	Write permissions
00	No lock. The write permissions are decided as set in FRAD*n*_WORD2[MDnACP] fields for respective master domain.
10	Write permissions are revoked for all masters. Any write transaction coming to this flash address region will not be forwarded through and will result in an error.
11	Write permissions are revoked for all masters except the master ID matching the ID specified by FRAD*n*_WORD2[EALO] fields.

- Flash region privilege checks – If the FRAD*n*_WORD3[EAL] fields are set to 00 then flash write access permissions for any IPS master is decided based on the settings done in FRAD*n*_WORD2[MDnACP] fields as given in table below. MD0ACP permission checks are done for transaction coming through target group 0 queue (TG0) and MD1ACP permission checks are for transactions coming through target group 1 queue (TG1).

Table 723. Flash region privilege checks

MDxACP value	Privilege access	Secure access	Write access
111	No	No	Not allowed
	No	Yes	Not allowed
	Yes	No	Allowed
	Yes	Yes	Allowed
110	No	No	Allowed
	No	Yes	Allowed
	Yes	No	Allowed
	Yes	Yes	Allowed
101	No	No	Not allowed
	No	Yes	Not allowed
	Yes	No	Not allowed
	Yes	Yes	Allowed
100	No	No	Not allowed
	No	Yes	Allowed
	Yes	No	Not allowed
	Yes	Yes	Allowed
0xx	-	-	Not allowed

If any transaction fails FRAD check then error interrupt is generated if enabled.

FRAD status registers keep the details of last transaction which lie within the address range of that respective FRAD and will be updated only when a new transaction comes which falls within the same address range.

Flash Region Compare Address Status (FRAD0_WORD4 - FRAD7_WORD4) register stores the flash start address that was compared and Flash Region Compare Status Data (FRAD0_WORD5 - FRAD7_WORD5) contains the master ID, privilege and secure attributes of the transaction. The transaction details are stored in FRAD register for which the address compare check passed. These status registers are not updated in case of read transfers or when FRAD check is disabled. For example, if the transaction address lies in the range set in FRAD2_WORD0 and FRAD2_WORD1 then the transaction details will be stored in

FRAD2_WORD4 and FRAD2_WORD5 registers and valid field [30] will be set. If transaction fails, the security or privilege attribute check for the corresponding FRAD then error field [29] is set in FRADx_WORD5 status register. This bit and other transaction details will remain latched unless cleared by writing '1' to W1C bit of corresponding FRAD in ERRSTAT register.

If transaction address doesn't match any of the FRAD address range or if matches with multiple FRAD address ranges, then also error interrupt is generated. But for no FRAD match, the details will not be stored in any of the FRAD status registers.

FRAD checks are done only for flash write transactions, flash read transactions are passed through to QuadSPI if MDAD checks are passed. At least one FRAD region should be made valid (if the FRAD check is enabled from MGC register) for flash read instructions to go through even when FRAD check is not done for read instructions. SFP module checks if a transaction is read or write from the SEQID written in IPCR register and LUT table programmed inside QuadSPI. Master Read Command (MRC) register shows the read command code which SFP block identifies. There are two command codes which are predefined READ_DDR and READ commands. Software can program two other command code as per its convenience by writing into fields [21:16] or [29:24] and then writing respective valid bit as 1.

80.13.2.2 Error conditions

Any transaction passing the MDAD checks will be checked for FRAD checks and can lead to following error scenarios.

Table 724. Error conditions

Error condition	Response
None of the FRAD are programmed	IPS transfer error will be generated and status will be latched in IPS_ERROR register
Transaction address doesn't fall within any of the FRAD address range	Error interrupt will be generated if enabled
Transaction match with multiple FRAD address range	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Transaction passes FRAD address check but fails privilege or security checks	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Transaction passes FRAD address check but range was locked by EAL bits	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Read transaction	No FRAD check will be done and no error will be generated for FRAD failure. But if FRAD check is enabled in MGC then at least one FRAD should be valid else it will give error during SFAR/IPCR write

80.13.2.3 Atomic commands considerations

For security reasons, the atomic commands (where flash's internal configuration region is accessed) like flash erase etc. should always be programmed in last 6 SEQID locations of LUT. FRAD0 has access to all the LUT locations including these last 6 SEQID. Remaining FRAD regions will not allow write access if the IPCR SEQID is set for any of the last 6 locations of LUT. It will result in FRAD access error and it will set in FRAD status registers. Also the software must set the FRAD0 MDACP to 101 so that write access is allowed only for secure privilege masters. This is done to ensure that no other master can use the atomic commands like flash erase to change the contents of flash. So when any master wants to use these atomic command programmed in last 6 locations of LUT it will have to write FRAD0 start address in SFAR and keep IPCR DATSZ such that it falls under FRAD0 address region and MDACP programmed in FRAD0 are checked.

For flash configuration in case of dual-die the software needs to change the address range of FRAD0 accordingly so that address goes to second die. Similar consideration to be taken in case of dual flash where Port A and B are being used.

80.13.3 TBDR register write lock

SFP module keeps the TBDR write locked for IPS transactions by default. When a IPS master writes SFAR and IPCR transactions and this transaction passes MDAD and FRAD checks then the accesses are unlocked for that master ID. Lock and unlock procedure is shown with an example in figure below:

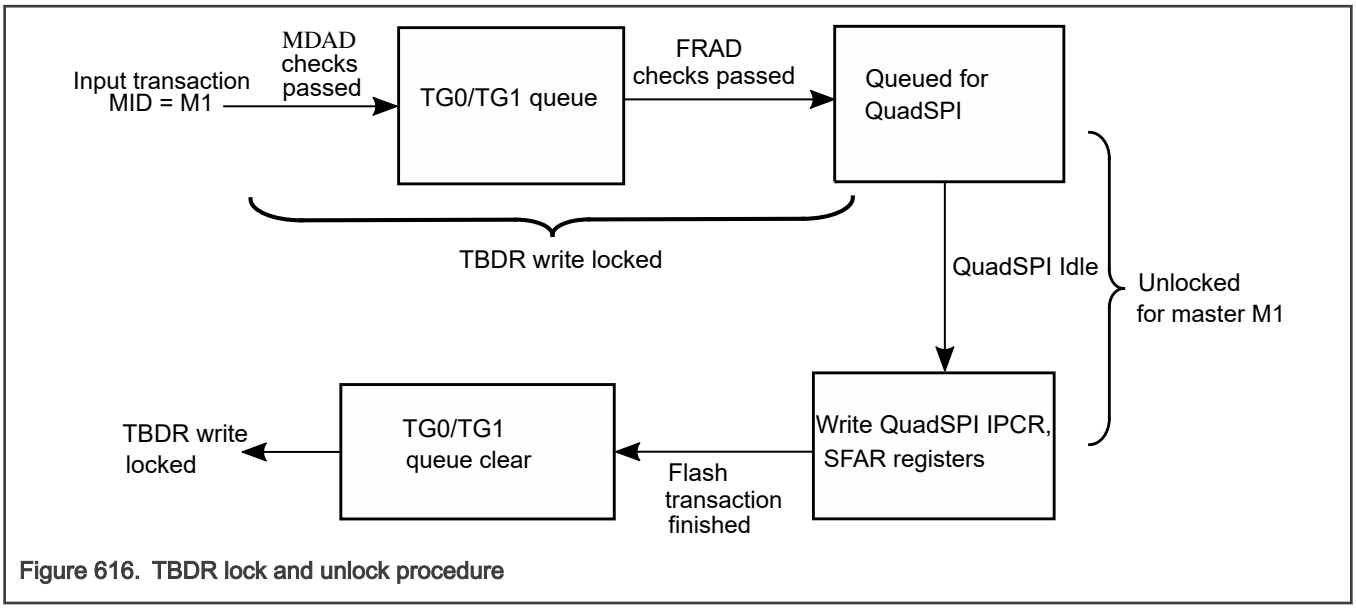

Figure 616. TBDR lock and unlock procedure

If any master writes on TBDR register when it is not unlocked for that master ID it will result in IPS transfer error. IPS master should ensure that it writes the TBDR register once QuadSPI registers have been written by the SFP module. This can be checked by reading FSM Status (FSMSTAT). Bits [11:8] of this register tells which master ID is currently active, and if the value of bits [1:0] is 01 or 10 and bit 31 is set as 1, then the TBDR lock is open for write transactions. It is advisable that for write transactions where IDATSZ is non zero, master clears the TBDR buffer from any residue data and program the TBCT[WMRK] watermark once its request is granted in arbitration (FSMSTAT bit [1:0] are 01). In case of transfers having IDATSZ programmed as 0 the TBDR register remains locked and data can't be written to this register. In case DMA is being used to fill the TBDR buffer, program RSER[TBFDE] field to 1 only when write access is granted and TBDR access is unlocked after checking FSMSTAT[STATE] field. Once DMA completes the TBDR write reset, this field is set back to 0. After this, the SFP will write SFAR and IPCR to QuadSPI triggering the flash transfer. It should be made sure that the DMA should have same master ID as the master which won the arbitration.

80.13.4 Transaction status registers

SFP module has two registers (FSM Status (FSMSTAT) and FlashSeq Request (FLSEQREQ)) which shows the current and last transaction status. These registers are updated only after MDAD and FRAD check are passed.

- FSM Status (FSMSTAT) register shows the current transaction which is queued for QuadSPI when valid field [31] is set. Field [16] of this register if set to 1 then it is a non-read instruction sequence and it is set to 0 then it means that this is a read sequence. Fields [11:8] show the master ID from which this transaction is generated. Fields [1:0] show the current state of active transaction when valid field [31] is set.

  The figure below shows the IPS transaction flow inside SFP block along with various values of bits [1:0]:

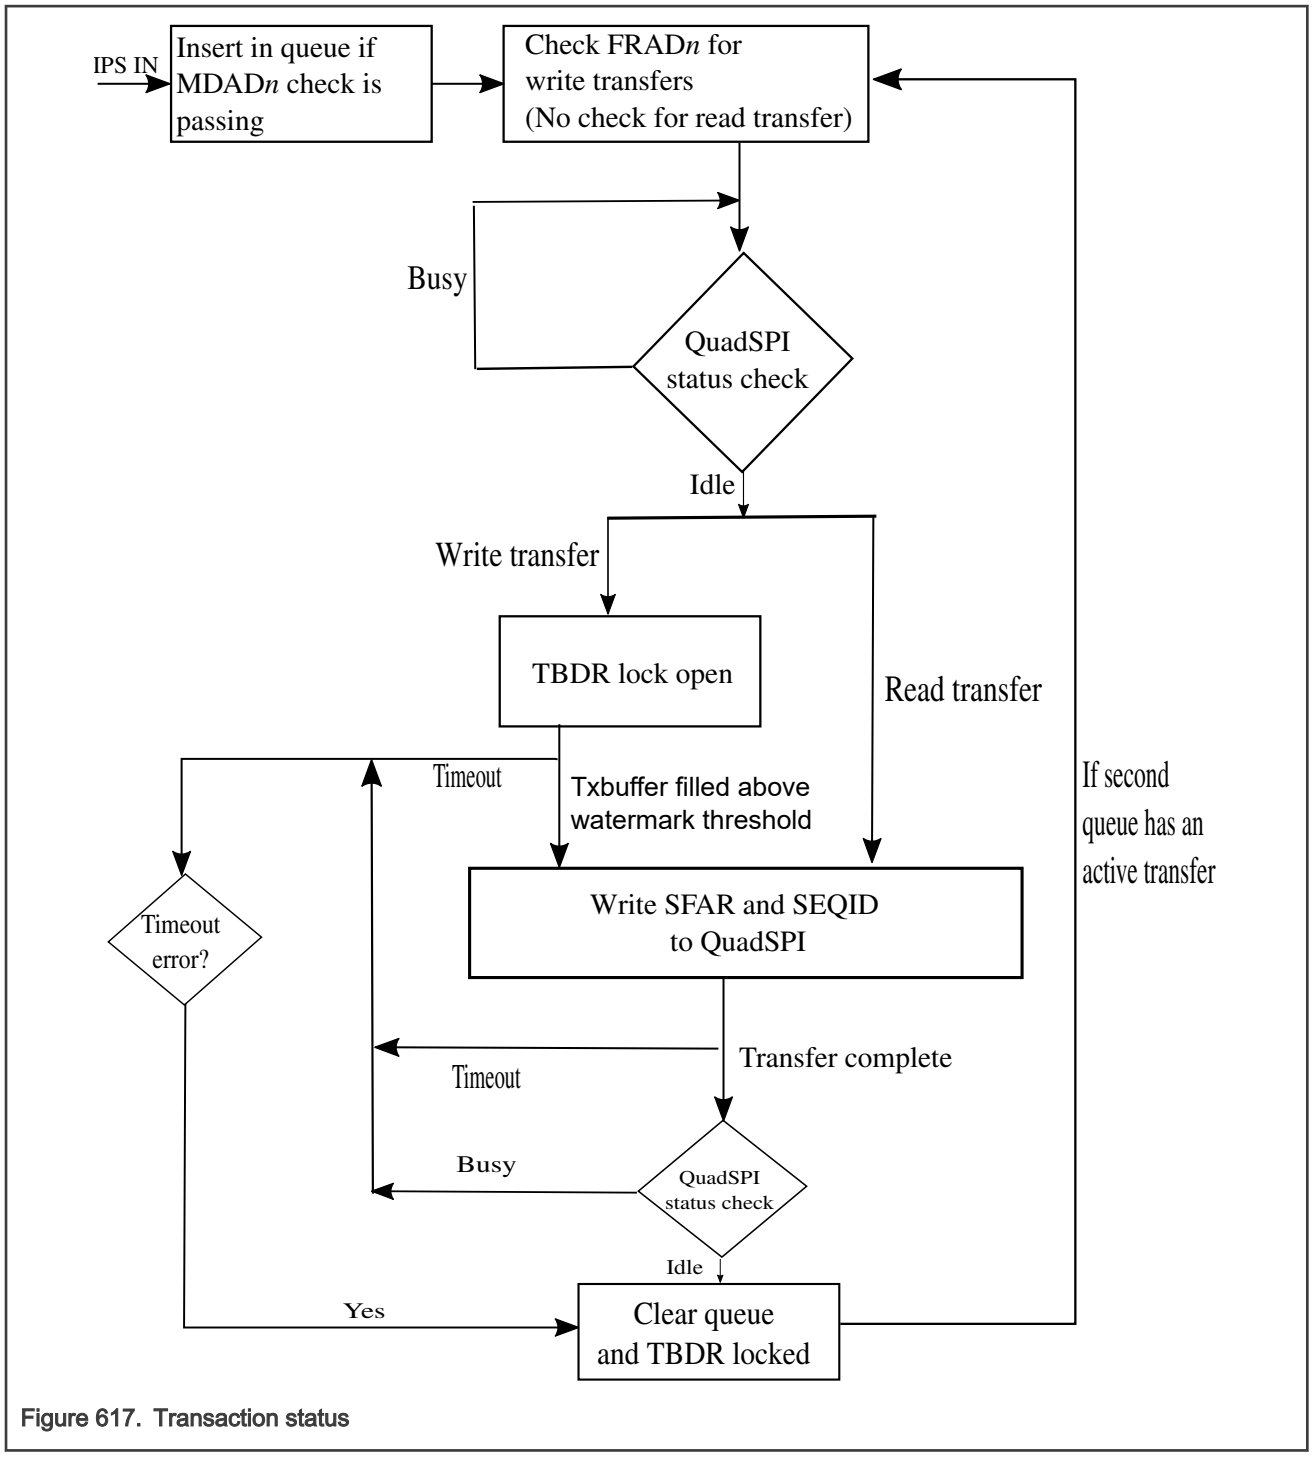

Figure 617. Transaction status

NOTE

If the DATSZ programmed in TG0/TG1 IPCR register is more than the TX buffer watermark threshold value (256-Watermark programmed in TBCT) then it waits for threshold to cross before writing the SFAR and IPCR registers to QuadSPI. Else SFP block waits for one entry to be written to TBDR register and after that it writes the SFAR and IPCR to QuadSPI thus triggering the transfer. In case of read transfers, SFAR and IPCR are written as soon as QSPI is IDLE.

NOTE

QuadSPI is considered IDLE if transaction is finished at flash, No DMA and interrupt pending and RX data is completely read. In case RX data is pending it can be cleared by writing to MCR[CLR_RXF]. Refer to section Timeout error for more details.

FSM state values in FSM Status (FSMSTAT) for different states are in the following table:

Table 725. FSMSTAT register field details

FSMSTAT register fields	
VLD	0 - No IPS transfer is queued for launch to QuadSPI 1 - IPS transfer is queued or running in QuadSPI
STAT	00 - QuadSPI is busy with AHB transfer, any DMA transfer is pending, RDBFL has residue data or any interrupt is pending. 01 - TBDR lock is open. QuadSPI considers IPS transfer. AHB transfer should not start. 10 - TX buffer filled above threshold. Write transfer is triggered. SEQID is written. 11 - Read transfer is triggered. SEQID is written.

For flash write transfers which passes MDAD and FRAD checks and QuadSPI is not busy with any previous transfer, TBDR lock is opened and bits [1:0] shows value of 01. Once the IPS master fills the TX buffer till the level where free entries in TX buffer are less than the watermark threshold set in TX Buffer Control Register (TBCT) and SR[TXWA] flag is de-asserted, SFP block writes the SFAR and IPCR entries to QuadSPI registers and transaction is triggered. To avoid underrun, program the watermark accordingly for size of the data to be transferred. This programming can be done when TBDR access is allowed after arbitration is granted. TBCT Watermark can be programmed as 256-(IDATSZ/4-1) in most of the scenarios. If the DATSZ entry written in IPCR is less such that TX buffer can never be filled till watermark threshold, in such cases SFP block does not wait for the TBCT[WMRK] to trigger and writes the SFAR and ICPR registers as soon as one data entry is written to TBDR register. When the SFAR and IPCR register are written, bits [1:0] are set to 10. In case of flash memory read transfers SFAR and IPCR entries are written to QuadSPI as soon as QuadSPI is IDLE and bits [1:0] are set to 11. QuadSPI is considered IDLE only if no AHB/IPS transfer is ongoing, any DMA transfer is not pending, RDBFL doesn't have residue data and any interrupt is not pending (FR[TFF], FR[TBFF], FR[TBUF], FR[RBDF], FR[RBOF], FR[ABOF], FR[AIBSEF], FR[AITEF], , , FR[IPIEF], , FR[ILLINE], ,). Valid bit [31] goes to 0 once the IPS transfer is completed. IPS master should clear the TX buffer before writing to TBDR register to ensure that no data from previous transaction is left in TX buffer.

If the IPS transaction has passed the MDAD and FRAD checks but QuadSPI is busy with some AHB transfer, then the bits [1:0] are set to 00. Other than ongoing AHB transfer QuadSPI can be busy because of other reasons also like if any TXDMA or RXDMA pending, if read buffer has data pending or if any QuadSPI interrupt is enabled and pending for servicing. So IPS master should ensure that no interrupt is pending or previous read transfer is completed. If the QuadSPI remains busy for a longer time it may result in timeout error.

Software must take care that no AHB transaction is launched when any IPS transaction is ongoing, TBDR lock is open or IPS transaction is getting executed on QuadSPI. It can be checked by reading this FSM status register. if the valid bit is 1 and bits [1:0] are set to 01, 10 or 11 then no AHB transfer should be generated towards QuadSPI.

For any IPS initiated RW transaction which needs two separate transactions at flash interface, like Write-Enable transaction followed by Write-data transaction (Data-Learn flash transaction followed by Read-data transaction) at flash interface must be joined together with JMP_2_SEQ instruction.

- FlashSeq Request (FLSEQREQ) register holds the details of transaction which was last send to QuadSPI. After a flash transaction is completed this register is updated and its valid field [31] is set to 1. This register holds the command type (read or write), transaction master ID (fields [3:0]), target group queue (TG0 or TG1) from which this transaction passed in field [4], privilege and secure attributes for the transaction, SEQID (fields [19:16]) and number of flash descriptor FRAD within whose address range the transaction lies (fields [14:12]).

This register also contains a timeout error field [27] which is set when a timeout error occurs, and transaction is aborted. When the error occurs this register keeps the status latched unless it is cleared by writing 1 to clear field [29].

80.13.5 Timeout error

MTO register can be programmed with a timeout value above which the transaction should be aborted. When the transaction passes MDAD and FRAD level checks and QuadSPI is idle (no AHB transaction is ongoing, no DMA transfer is pending, RDBFL doesn't have any residue data from last transfer and (FR[TFF], FR[TBFF], FR[TBUF], FR[RBDF], FR[RBOF], FR[ABOF], FR[AIBSEF], FR[AITEF], , , FR[IPIEF], , FR[ILLINE], ,) interrupt is not pending) this counter is started. If the transaction is not completed before this timeout counter reaches the value programmed in MTO register the transaction is considered aborted by SFP and an error interrupt is generated if enabled. The error bit is also set in FLSEQREQ register along with the transaction details. After the timeout error, next transaction is written to QuadSPI register which was queued in another target group queue once SR[BUSY] flag goes low.

80.13.6 Arbitration lock

The arbitration lock feature is used to lock the arbitration for a particular queue. This lock can be requested by a master by writing '1' into IPCR[ARB_LOCK] field. Once the transaction passes both the checks (MDAD & FRAD) and wins the arbitration, this lock will be granted. After this, the transaction from the other queue will not be granted unless the arbitration is unlocked by previous queue. The master which locked the arbitration can unlock it by writing '1' to IPCR[ARB_UNLOCK] field. Once the transaction with unlock bit 1 passes the MDAD and FRAD checks, it will unlock the arbitration. After this transaction is finished, the other queue will be granted the arbitration which was waiting.

This arbitration lock feature can be used by software while doing any transaction to flash which may result in a waiting period. For example, in case of NOR flash, after a write is issued to flash there is a waiting period (TPP) for which the flash is inaccessible. In this case, the software should ensure that while writing this SEQID to IPCR register it should lock the arbitration so that transaction coming to other queue is not passed to flash controller which may result in failure. Once the software ensures that waiting period at flash is over, it can read the flash configuration/status registers to confirm. And after getting confirmation, it can send another read command to same configuration register with IPCR[ARB_UNLOCK] field set to '1'. This will ensure that the transaction waiting in another queue are granted. If the flash being used does not have a waiting period attached with transactions, then this ARB_LOCK field can be always kept to 0.

In case software uses this LOCK functionality RWW support will not be available. Because in this case, all the transaction from other queue which was blocked from arbitration will be blocked irrespective of read or write access. So, RWW support (read can go through even when flash is in waiting state) will not be available. The master which has arbitration lock granted can still send read accesses to flash during the waiting period in case the flash supports it.

80.13.7 Soft reset consideration with SFP

If there is any pending transaction in MDAD queue, do not assert QuadSPI reset bits unless you observe unexpected behavior like no response from the module. In that case, assert QSPI reset twice.

In case the soft reset is being used for QSPI, software should take some considerations so that correct functionality is maintained. if the soft reset is asserted when a transaction is being executed by SFP (FSM_STATE [1:0] bits are 01, 10 or 11) then this transaction will be aborted. Different conditions that can occur in case of soft reset are listed in table below:

Table 726. Soft reset conditions

Condition at time of soft reset	FSM state register at time of soft reset	Result	Timeout scenario
Some AHB transaction was ongoing and SFP/IPS is in waiting state.	FSM_STATE[1:0] = 00	After the soft reset if de-asserted the SFP will schedule its transaction over QSPI. FSM_STATE[1:0] will change to other values than 00. Software can fill TBDR in case it is a write transfer or start reading from RBDR.	In this case software doesn’t writes to TBDR or read from RBDR it will result in timeout error.

Table continues on the next page...

Table 726. Soft reset conditions (continued)

Condition at time of soft reset	FSM state register at time of soft reset	Result	Timeout scenario
QSPI was IDLE and SFP transaction has been arbitrated. TBDR is being filled and SFAR, IPCR are not currently written to QSPI.	FSM_STATE[1:0] = 01	Currently TBDR was being filled after soft reset all the entries in TBDR are flushed. So it is expected from software that it will start filling TBDR from start after the reset has de-asserted. SFP will write SFAR and IPCR to QSPI once its normal conditions are met (when number of available spaces in the TX buffer is greater than or equal to the value provided by TBCT[WMRK] or single TBDR write in case watermark check is disabled)	Timeout will occur if TBDR is not filled again after the soft reset is lifted.
SFP has written just SFAR to QSPI IPCR is not written yet. (For a read transfer or write transfer with data size 0)	FSM_STATE[1:0] = 01	After the soft reset is lifted the SFP will write ICPR to QSPI module and FSM_STATE will change to 11 (read) or 10(write). Transaction will finish normally.	Timeout conditions will be same as that for normal transfer.
SFP has written just SFAR to QSPI IPCR is not written yet. (Write data size is non 0)	FSM_STATE[1:0] = 01	After soft reset is lifted the SFP will write IPCR to QSPI module once software fill TBDR (from start) and FSM_STATE will change to 10.	Timeout conditions will be same as that for normal transfer.
SFP has written SFAR and IPCR to QSPI.	FSM_STATE[1:0] = 10 or 11	After the soft reset is de-asserted the current transaction will be deemed aborted. FSM_STATE valid will go low as transfer has finished.	No timeout.

So to conclude in case the soft reset is asserted when FSM_STATE[31] bit is 1 and state bits are 10 or 11 current transaction will be aborted & the next transaction will proceed as normal. In case the state bits are 00 or 11 then it is advisable that software doesn't writes into TBDR after the reset is de-asserted and waits for timeout error to be generated to know when current ongoing SFP transaction is aborted. After clearing the timeout error a new transaction can be launched to SFP or if already a new transaction is present in another queue it will be arbitrated.

80.13.8 Error Interrupt Enable

INT_EN register allow software to disable or enable the interrupt signal generation in case of any of the listed error conditions. This interrupt is generated on 'ipi_int_ored' interface signal of QuadSPI.

- Time out error (INT_EN[TO_ERR])
- IPCR register write error (INT_EN[TG*n*IPCR])
- SFAR register write error (INT_EN[TG*n*SFAR])
- IPS common error (INT_EN[IPS_ERR])
- FRAD access error (INT_EN[FRAD*n*ACC])
- No FRAD address range match error (INT_EN[FRADMTCH])

If the respective field is set to 1 for any of the error conditions, then the interrupt signal is set to 1 when that error occurs and it remains set until the error is cleared by writing 1 to error clear bit as listed in register descriptions.

80.14 Memory map and register definition

This section provides the memory map and register definitions for the QuadSPI module.

80.14.1 Register write access

Following are the write access restriction terms that apply to all the registers:

- Register write access restriction

  For each register field, the write access conditions are specified in the detailed register description.

  The following table provides a description of the write access conditions. If, for a specific register bit or field, none of the given write access conditions is fulfilled, any write attempt to this register bit or field is ignored without any notification. The values of the bits or fields are not changed.

  The condition term [A or B] indicates that the register or field can be written to if at least one of the conditions is fulfilled.

Table 727. Register write access restrictions

Condition	Description
Anytime	No write access restriction
Disabled mode	Write access only if MCR[MDIS] = 1
Normal mode	Write access only if the module is in the normal mode

- Register write access requirements

  You can access all registers using 8-bit, 16-bit, and 32-bit wide operations. For some of the registers, at least a 16-bit or 32-bit wide write access is required to ensure correct operation. This write access requirement is stated in the detailed register description for each affected register.

80.14.2 QuadSPI register descriptions

This section provides the memory map and register definitions for the QuadSPI module.

Access to the following addresses does not result in a transfer error:

- 64h
- 138h
- 168h
- 188h
- 18Ch
- 198h

80.14.2.2 Module Configuration Register (MCR)

Offset

Register	Offset
MCR	0h

Function

This register holds configuration data associated with the QuadSPI operation.

NOTE

When out of reset, after first initial MCR programming and exiting module disable mode (that is, when the value of MCR[MDIS] is 0), you must write 1 to MCR[SWRSTSD] and release it after six (three system and three flash memory) clock cycles.

Special write-access is permitted in different modes:

- DQS_FA_SEL: Disabled mode
- ISD3FA, ISD2FA: Disabled mode
- All other fields: Anytime

Field	Function
22 —	Reserved
21-20 —	Reserved
19 —	Reserved
18 —	Reserved
17 ISD3FA	Idle signal drive IOFA[3] flash memory A Determines the logic level that the IOFA[3] output of the QuadSPI module is driven to in the inactive state. See Driving flash memory control signals in single and dual modes for details. 0b - IOFA[3] is driven to logic L 1b - IOFA[3] is driven to logic H
16 ISD2FA	Idle signal drive IOFA[2] flash memory A Determines the logic level that the IOFA[2] output of the QuadSPI module is driven to in the inactive state. See Driving flash memory control signals in single and dual modes for details. 0b - IOFA[2] is driven to logic L. 1b - IOFA[2] is driven to logic H.
15 —	Reserved
14 MDIS	Module disable Allows the clock to the non-memory mapped logic in the QuadSPI to be stopped. 0b - Enable QuadSPI clocks 1b - Allow external logic to disable QuadSPI clocks
13 —	Reserved
12 DLPEN	Data learning pattern enable Write 1 to this field to enable data learning mechanism.
11 CLR_TXF	Clear TX FIFO/buffer This is a self-clearing field that invalidates the TX buffer content.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE Software must wait for at least five system cycles and three flash cycles after writing '1' to this field. 0b - No action 1b - Read and write pointers of the TX buffer are reset to 0 and TBSR[TRCTR] is reset to 0.
10 CLR_RXF	Clear RX FIFO This is a self-clearing field that invalidates the RX buffer content. 0b - No action 1b - Read and write pointers of the RX buffer are reset to 0 and RBSR[RDBFL] is reset to 0.
9 —	Reserved
8 VAR_LAT_EN	Variable latency Is used to enable the variable latency feature in the controller. This field is valid for HyperRAM where data strobe acts as an output from the memory during the command and address (CA) cycles of a read or write transaction. This is to indicate whether additional initial access latency is needed to perform a dynamic memory refresh operation. For details, see HyperRAM support. 0b - Fixed latency: Twice + 1 latency enable 1b - Variable latency: "Once" or "twice + 1" the initial latency based on data strobe during the CA phase. If enabled, you need to ensure that the value of FLSHCR[TCSS] is >= 2.
7 DDR_EN	DDR mode enable Enables the DDR mode 0b - 2x clock disabled for SDR instructions only 1b - 2x clock enabled for DDR instructions. Note: 2x clock - This is twice the SCKF clock used to shift the TX data by 90 degree.
6 DQS_EN	DQS enable Is valid for both the SDR and DDR modes. For details, see DQS sampling method. 0b - Reserved. Do not program 0 to this field. 1b - DQS enabled. The incoming data is sampled on both the edges of the DQS input when the value of MCR[DDR_EN] is 1; else, on only one edge when MCR[DDR_EN] is 0.
5 —	Reserved
4 DQS_OUT_EN	DQS as an output

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Is valid when data strobe is also used as an output from controller during the write data phase. This is valid for HyperRAM where the data strobe acts as a Read Write Data Strobe (RWDS). For details, see HyperRAM support. 0b - DQS as an output from controller is disabled. 1b - DQS as an output from controller is enabled.
3-2 —	Reserved
1 SWRSTHD	Software reset for AHB domain 0b - De-assert Software reset 1b - AHB domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects. **NOTE** The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by setting MCR[SWRSTHD] to 0), it is recommended to set the value of MCR[MDIS] to 1. After the software resets have been deasserted, the normal operation can be started by setting MCR[MDIS] to 0. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.
0 SWRSTSD	Software reset for serial flash memory domain 0b - De-assert Software reset 1b - Serial flash memory domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects. **NOTE** The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should therefore be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by specifying 0 as the value for MCR[SWRSTSD]), it is recommended to specify 1 as the value for MCR[MDIS]. After the software resets are deasserted, the normal operation can be started by specifying 0 as the value for MCR[MDIS]. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.

80.14.2.3 IP Configuration Register (IPCR)

Offset

Register	Offset
IPCR	8h

Function

This register provides all the configuration required for an IP-initiated command, which can be triggered by writing in the SEQID field of this register. If the SEQID field is written successfully, a new command to the external serial flash memory is initiated per the sequence pointed to by this field. See Normal mode for details on command triggering and command execution.

Special write-access is permitted if:

- SR[IP_ACC]=0

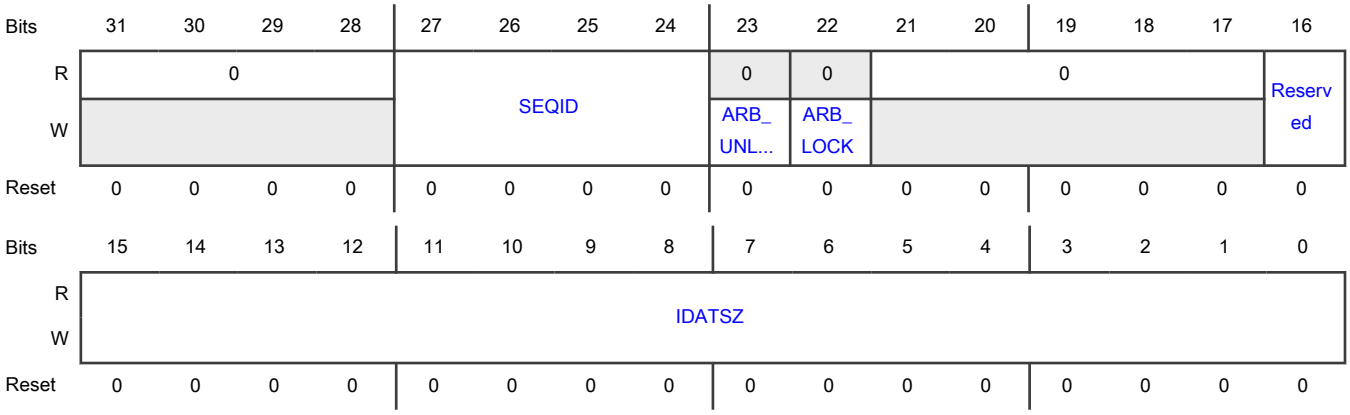
NOTE

Only one of the fields should be written '1' at a time out of ARB_LOCK and ARB_UNLOCK. If both the fields are written '1' at same time then it will invert the lock status. If the arbitration was already locked, it will unlock it and vice-versa.

NOTE

If MDAD and FRAD checks are enabled in MGC register but none of the MDAD and FRAD descriptors are valid, then any write on this register will generate a bus transfer error

Diagram



Fields

Field	Function
31-28 —	Reserved
27-24 SEQID	Points to a sequence in the LUT This field contains the sequence index of the LUT. See LUT for details.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Each sequence index can accommodate up to 10 instructions (2 instructions per register). In case of read command, a write to this field triggers a transaction on the serial flash memory interface if QSPI SFM is IDLE. In case of write command, a write to this fields unlocks the TBDR access if QSPI SFM is not busy. Refer to section Secure flash protection for more details
23 ARB_UNLOCK	Arbitration Unlock Writing 1 to this bit unlocks the arbitration. Writing 0 will have no effect. The arbitration unlock will be done only if the transaction passes both MDAD and FRAD checks. To lock the arbitration write 1 to ARB_LOCK bit. This bit is always read as 0.
22 ARB_LOCK	Arbitration Lock Writing 1 to this bit locks the arbitration for that specific target queue. Writing 0 will have no effect. The arbitration lock will be granted only if the transaction passes both MDAD and FRAD checks. To unlock the arbitration write 1 to ARB_UNLOCK bit. This bit is always read as 0.
21-17 —	Reserved
16 —	Reserved
15-0 IDATSZ	IP data transfer size This field defines the data transfer size, in bytes, of the IP command.

80.14.2.4 Flash Memory Configuration Register (FLSHCR)

Offset

Register	Offset
FLSHCR	Ch

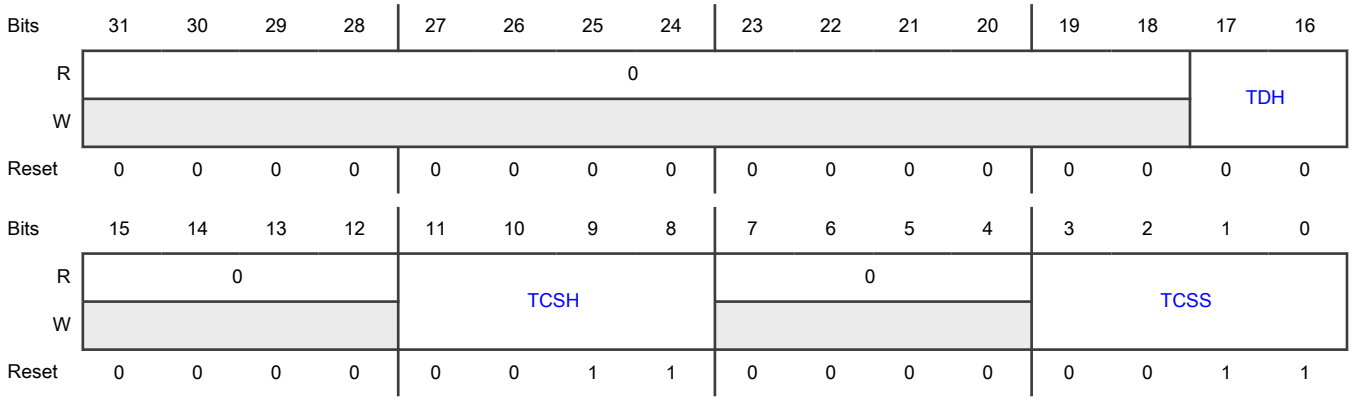
Function

This register contains the timings that are specific to the flash memory device. The QuadSPI controller must meet these timings for the device to function correctly.

Special write-access is permitted if:

- SR[AHB_ACC] = 0
- SR[IP_ACC] = 0

Diagram



Fields

Field	Function
31-18 —	Reserved
17-16 TDH	Serial flash memory data in hold time This field helps in meeting the data in hold time requirement of a flash memory. It is valid only in the DDR mode. **NOTE** This field should be set to 0x00 in the SDR mode (MCR[DDR_EN]=0). See Data input hold requirement of flash memory for details. The valid TDH programming options are shown below and the other combinations are invalid. 00b - Data aligned with the posedge of internal reference clock of QuadSPI 01b - Data aligned with 2x serial flash memory half clock
15-12 —	Reserved
11-8 TCSH	Serial flash memory CS hold time This hold time is in terms of serial flash memory clock cycles, and it must be greater than or equal to two flash memory clock cycles . Refer the chip datasheet for the exact value.
7-4 —	Reserved
3-0 TCSS	Serial flash memory CS setup time This setup time is in terms of serial flash memory clock cycles, and it must be greater than or equal to two flash memory clock cycles. Refer the chip Datasheet for the exact value.

80.14.2.5 Buffer 0 Configuration Register (BUF0CR)

Offset

Register	Offset
BUF0CR	10h

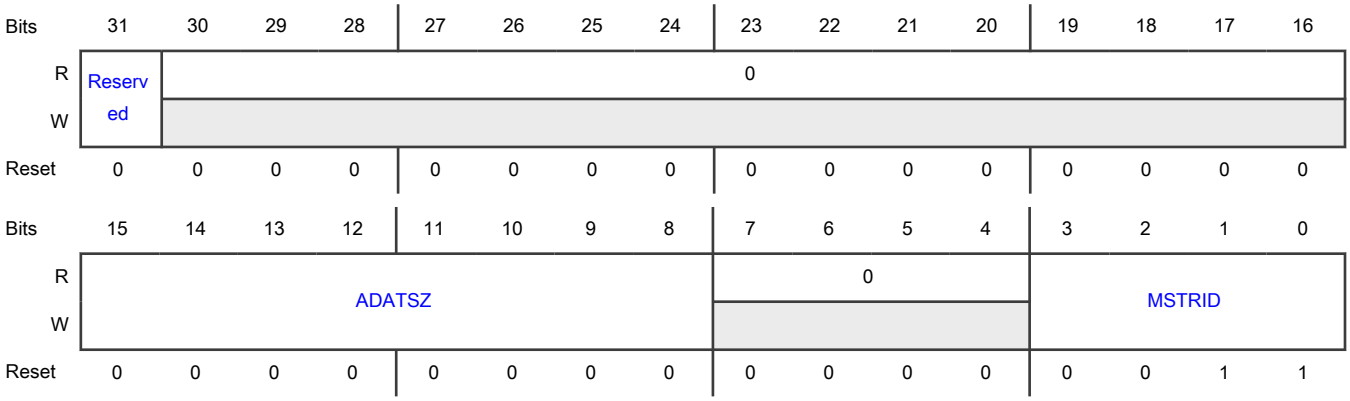
Function

This register provides the configuration for any read access routed to buffer0, which happens when the master ID of the incoming AHB request matches BUF0CR[MSTRID]. Any buffer "miss" leads to a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31 —	Reserved
30-16 —	Reserved
15-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of the buffer.
7-4 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 0 Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.14.2.6 Buffer 1 Configuration Register (BUF1CR)

Offset

Register	Offset
BUF1CR	14h

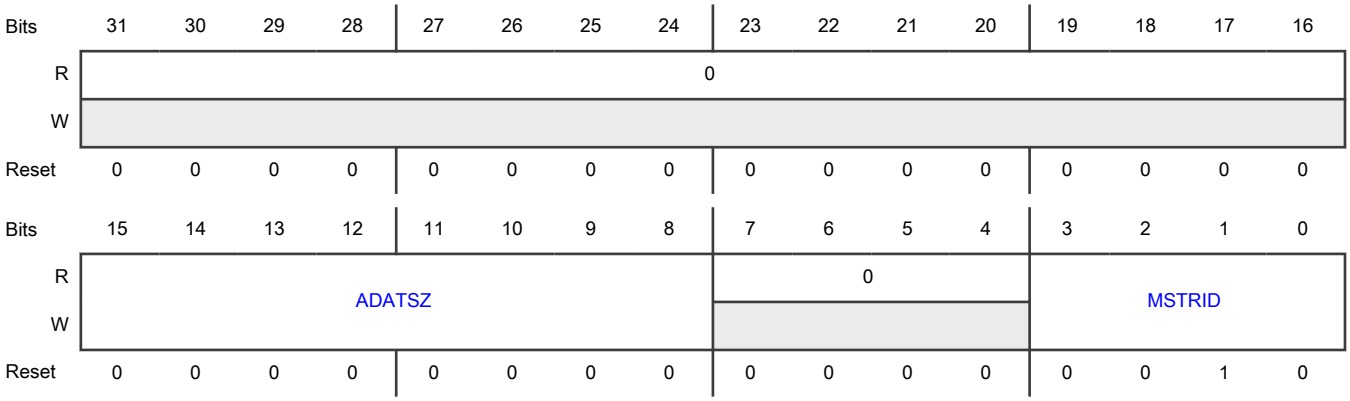
Function

This register provides the configuration for any access routed to buffer 1, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-16	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
15-8 ADATSZ	AHB data transfer size This field defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. For example, a value of 0x2 sets the transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. Software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 1 Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.14.2.7 Buffer 2 Configuration Register (BUF2CR)

Offset

Register	Offset
BUF2CR	18h

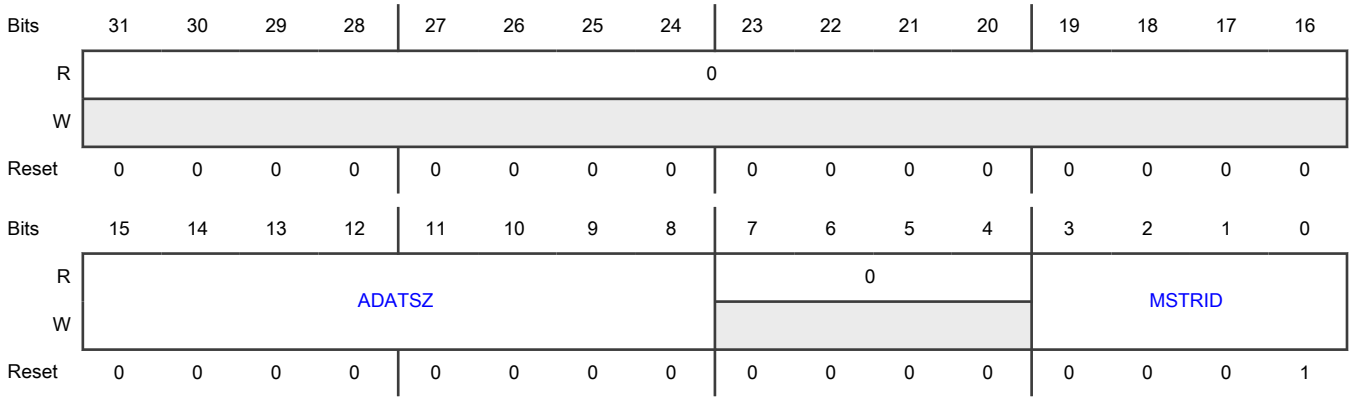
Function

This register provides the configuration for any access routed to buffer 2, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-16 —	Reserved
15-8 ADATSZ	AHB data transfer size This field defines the read data transfer size in 8 bytes of an AHB triggered read access to the serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID The ID of the AHB master associated with BUFFER2. Any AHB read access with this master ID is routed to this buffer. It must be ensured that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.14.2.8 Buffer 3 Configuration Register (BUF3CR)

Offset

Register	Offset
BUF3CR	1Ch

Function

This register provides the configuration for any access to buffer 3.

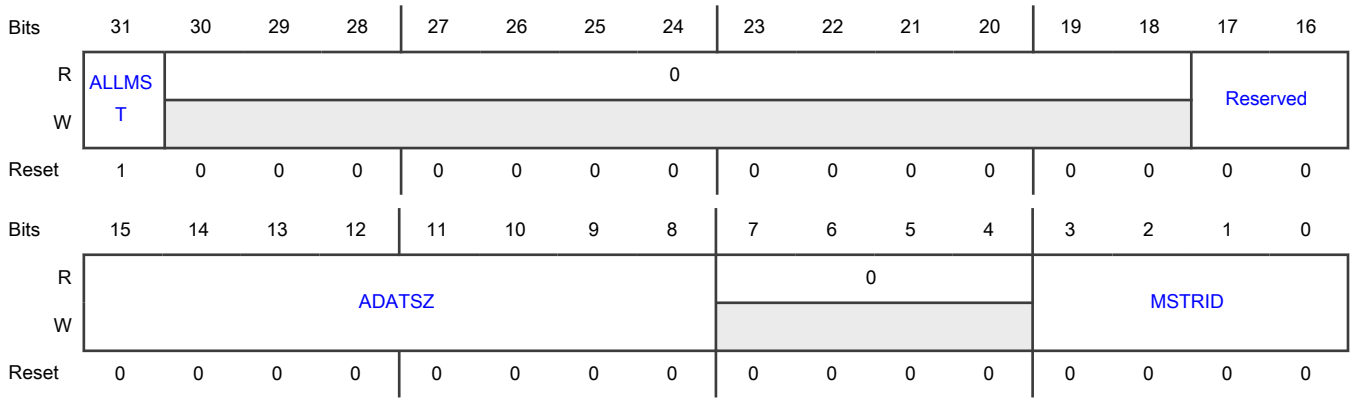
An access is routed to buffer 3 when the master ID of the incoming AHB request matches the MSTRID field of BUF3CR. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

In case the value of the ALLMST field is not 1, any such transaction (where master ID does not match any of the MSTRID fields) is returned with an ERROR response.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31 ALLMST	All master enable When set, buffer3 acts as an all-master buffer. Any AHB access with a master ID not matching with the master ID of buffer0, buffer1, or buffer2 is routed to buffer3. When set, the MSTRID field of this register is ignored.
30-18 —	Reserved
17-16 —	Reserved
15-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 3. Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.14.2.9 Buffer Generic Configuration Register (BFGENCR)

Offset

Register	Offset
BFGENCR	20h

Function

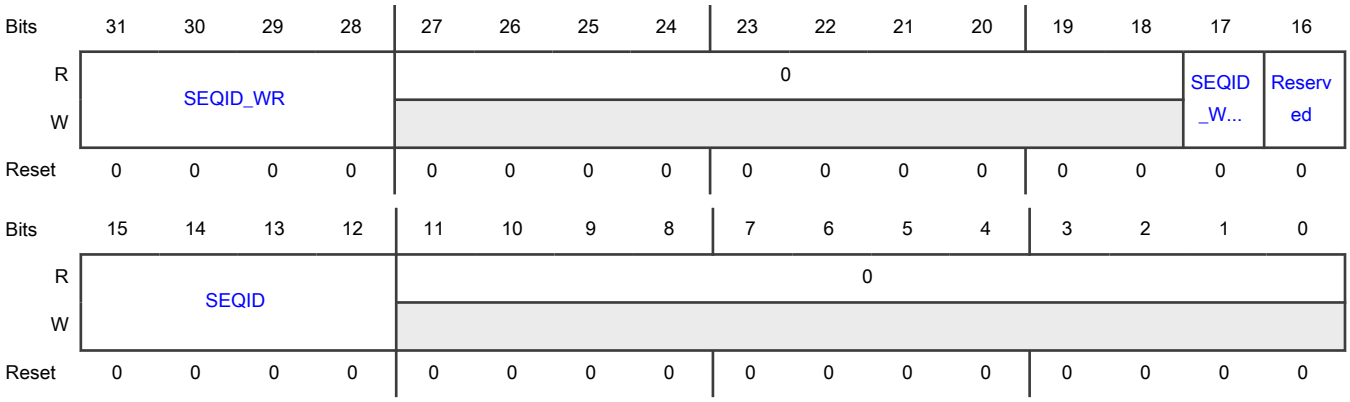
This register provides generic configuration to any of the buffer accesses. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by the SEQID field.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31-28 SEQID_WR	Write Sequence ID This field points to write seq-id of LUT and would be selected in case of AHB write transaction, if SEQID_WR_EN==1.

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
17 SEQID_WR_EN	Enable Write Sequence ID
16 —	Reserved
15-12 SEQID	Points to a sequence in the LUT. This field contains the sequence index of the LUT. and would be selected in case of AHB read transaction (and AHB write transactions if SEQID_WR_EN==0).. See LUT. **NOTE** If the sequence pointer differs in the new and the previous sequences, you should reset it. See sequence pointer clear register for more information.
11-0 —	Reserved

80.14.2.10 SOC Configuration Register (SOCCR)

Offset

Register	Offset
SOCCR	24h

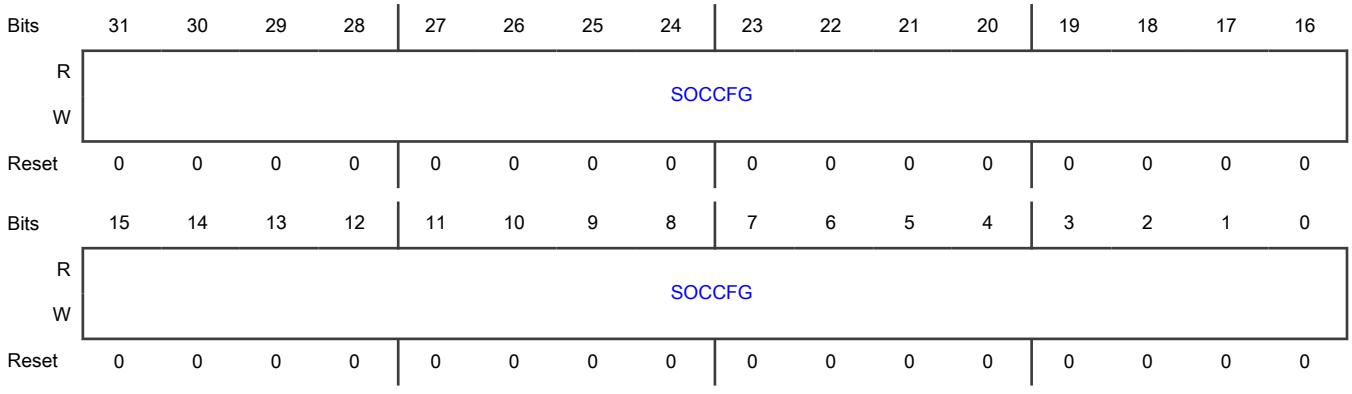
Function

This register is programmed at the chip level for QuadSPI configuration. For details, see chip-specific QuadSPI information.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-0 SOCCFG	SOC configuration This field configuration is specific to chip. For details, see chip-specific QuadSPI information.

80.14.2.11 Buffer 0 Top Index Register (BUF0IND)

Offset

Register	Offset
BUF0IND	30h

Function

This register specifies the top index for buffer 0, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

The register value should be set to the desired number of bytes. For example, setting BUF0IND[31:3] to 0 gives 0 bytes, setting the value to 1 gives 8 bytes, and so on.

The size of buffer 0 is the difference between BUF0IND and 0.

The software must ensure that the value of TPINDX0 is not greater than the size of buffer 0.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

14 PPW_RD_DIS	Page program wait read disabled 0b - Enables subsequent reads 1b - Disables subsequent reads to the flash memory. After the first write transaction, AHB read is returned with an error response.
13-8 —	Reserved
7-0 AWTRGLVL	AHB write trigger level Defines a trigger level of TX FIFO in terms of a 4-byte entry. AHB write to the flash memory is triggered when either of the following happens: • TX FIFO crosses the level defined by this field • AHB transaction completes This is done to prevent an under run in the flash memory. For HyperRAM, this field must be set to 0. For details, see HyperRAM support

80.14.2.15 DLL Flash Memory A Configuration Register (DLLCRA)

Offset

Register	Offset
DLLCRA	60h

Function

This register configures DLL and slave delay chain for flash memory A.

The value of the DLLEN field must be 1 after all reference (FREQEN, DLL_REFCNTR, DLLRES, SLAVE_AUTO_UPDT) delay chain configurations are programmed.

See DLL and delay chain usage for the programming sequence.

NOTE

See the chip data sheet for information on programming register fields.

NOTE

Please see the chip specific section of QuadSPI DLLCRA register for delay elements data

Fields

Field	Function
31 DLLEN	DLL enable 0b - DLL reference logic remains in reset and should be 0 for at least three flash memory clock cycles for reset. 1b - Enables DLL logic. Set it to 1 after all the configuration for DLLCR reference settings is complete.
30 FREQEN	Frequency enable 0b - Selects delay chain for low frequency of operation 1b - Selects delay chain for high frequency of operation
29-28 —	Reserved
27-24 DLL_REFCNTR	DLL reference counter Select the "n+1" interval of DLL phase detection and reference delay updating interval (minimum recommended value = 1).
23-20 DLLRES	DLL resolution Minimum resolution for DLL phase detector to remain locked/unlocked based on flash memory clock jitter. The minimum value is 2, and should be programmed to a more suitable value, such as 6.
19-16 SLV_FINE_OFFSET	Fine offset delay elements in incoming DQS This field sets the number of fine offset delay elements up to 16 in incoming DQS, and the default must be 1 element.
15 —	Reserved
14-12	T/16 offset delay elements in incoming DQS This field sets the number of T/16 offset delay elements in incoming DQS; default is 0.

Table continues on the next page...

Table continued from the previous page...

Field	Function
SLV_DLY_OFFSET	
11-8 SLV_DLY_COARSE	Delay elements in each delay tap This field sets the number of delay elements in each delay tap. The field is used to overwrite DLL-generated delay values and works when the value of SLV_DLL_BYPASS is 1. Note : Please refer to the QuadSPI datasheet for more details.
7-5 —	Reserved
4 DLL_CDL8	DLL CDL8 Enable 0b - DLL is implemented to support within 2x variation 1b - DLL is implemented to support within 3x variation (BCS -> WCS)
3 SLAVE_AUTO_UPDT	Slave chain update This field automatically updates the slave chain as soon as DLL is locked. 0b - Auto-update feature is disabled. 1b - Auto-update feature is enabled.
2 SLV_EN	Slave enable 0b - DLL slave logic remains in reset, and its value should be 0 for at least three flash memory clock cycles for reset. 1b - Enables DQS slave delay chain, and should be 1 before any slave configuration settings take place.
1 SLV_DLL_BYPASS	Slave DLL bypass This field enables selection of the number of delays in each slave delay tap. 0b - Disables manual selection of coarse delays in the slave delay chain. 1b - Enables selection of number of delays in each slave delay tap, based on DLLCRA[SLV_DLY_COARSE].
0 SLV_UPD	Slave update You must program this field only after slave delay chain configuration takes place. 0b - Disables any further update on DQS slave delay chain. 1b - Updates the DQS slave delay chain with either ref-delay or bypass slave delay value, and should be set in the absence of the DQS clock.

80.14.2.16 Parity Configuration Register (PARITYCR)

Offset

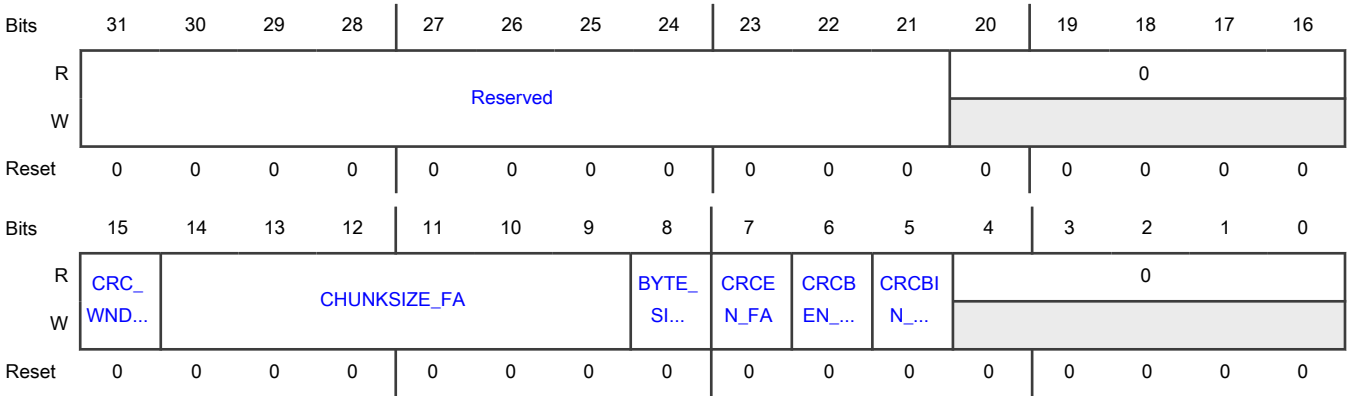
Register	Offset
PARITYCR	6Ch

Function

This register replicates the parity related configuration programming performed on the flash memory configuration registers.

You must write 1 to PARITYCR[CRCEN_FA] and PARITYCR[CRCEN_FB] after all parity configuration bits are programmed. However, you can program PARITYCR[BYTE_SIZE_FA] and PARITYCR[BYTE_SIZE_FB] at any time.

Diagram



Fields

Field	Function
31-21 —	Reserved
20-16 —	Reserved
15 CRC_WNDW_FA	CRC address window configuration 0b - Calculates parity (CRC) over fixed address window within the denoted flash memory A chunk size boundary. 1b - Calculates parity (CRC) over incremental window of flash memory A chunk size, irrespective of address.
14-9 CHUNKSIZE_FA	Chunk size for flash memory A Defines the chunk size (in terms of 4 bytes) after parity is inserted and compared by the QuadSPI controller for flash memory A. Values 0x1, 0x2, and so on indicate 4 bytes, 8 bytes, and so on.
8	Byte size for flash memory A

Table continues on the next page...

Table continued from the previous page...

Field	Function
BYTE_SIZE_FA	This field can be programmed any time. It enables single-byte, read/write parity with flash memory A configuration register. The field overrides the chunk size used for flash memory data array. You must write 1 to this field before any read/write operation on the flash memory internal registers. And you must write 0 to this field before reading flash memory data array.
7 CRCEN_FA	CRC parity checker logic 0b - Disables parity mechanism. In case of parity error, set it to 0 to clear parity error. Only supported for DDR Octal commands. 1b - CRC parity checker logic for flash memory A read paths. Configure this field after programming CHUNK_SIZEA, CRCBEN_FA and CRCBIN_FA.
6 CRCBEN_FA	Adds CRC bar parity from flash memory A output to QuadSPI controller
5 CRCBIN_FA	Adds CRC bar parity to flash memory A input from QuadSPI controller
4-0 —	Reserved

80.14.2.17 Serial Flash Memory Address Register (SFAR)

Offset

Register	Offset
SFAR	100h

Function

The module automatically translates this address on the memory map to the address on the flash memory. When operating in a 24-bit mode, only bits 23-0 are sent to the flash memory. In the 32-bit mode, bits 27-0 are used with bits 31-28 driven to 0 when the value of SFACR[CAS] is 0. For example, if the value of SFACR[CAS] is 3, then bits 26-3 are sent to the flash memory as its page address in case flash memory is operating in a 24-bit mode. The total number of address bits requested by the flash memory, as its page and column address, must not be more than 32 bits. See Table 729 for the mapping between the access mode and the SFAR content and Normal mode for details on command triggering and command execution. The software must ensure that the serial flash memory address provided in the SFAR register lies in the valid flash memory address range, as defined in Table 729.

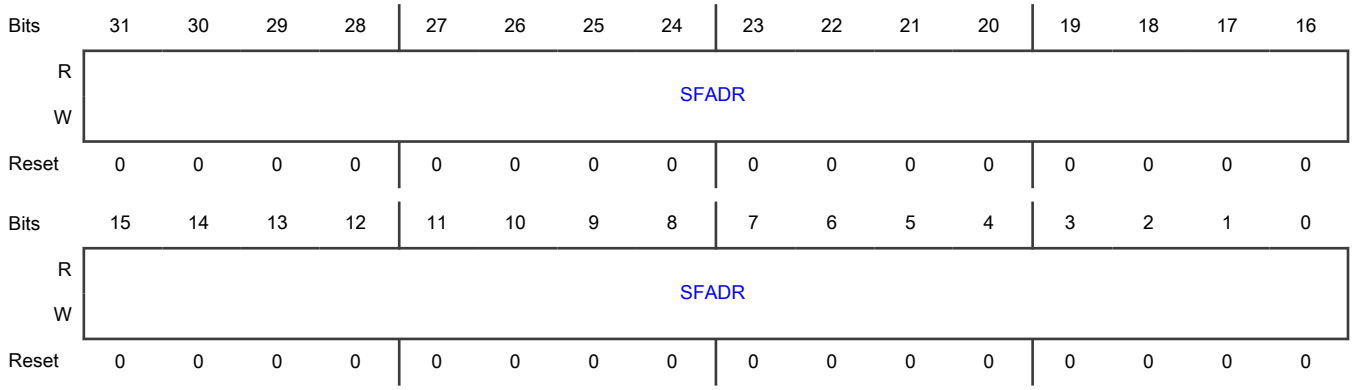
Special write-access is permitted if:

- SR[IP_ACC] = 0

NOTE

If MDAD and FRAD checks are enabled in MGC register but none of the MDAD and FRAD descriptors are valid, then any write on this register will generate a bus transfer error

Diagram



Fields

Field	Function
31-0 SFADR	Serial flash memory address

80.14.2.18 Serial Flash Memory Address Configuration Register (SFACR)

Offset

Register	Offset
SFACR	104h

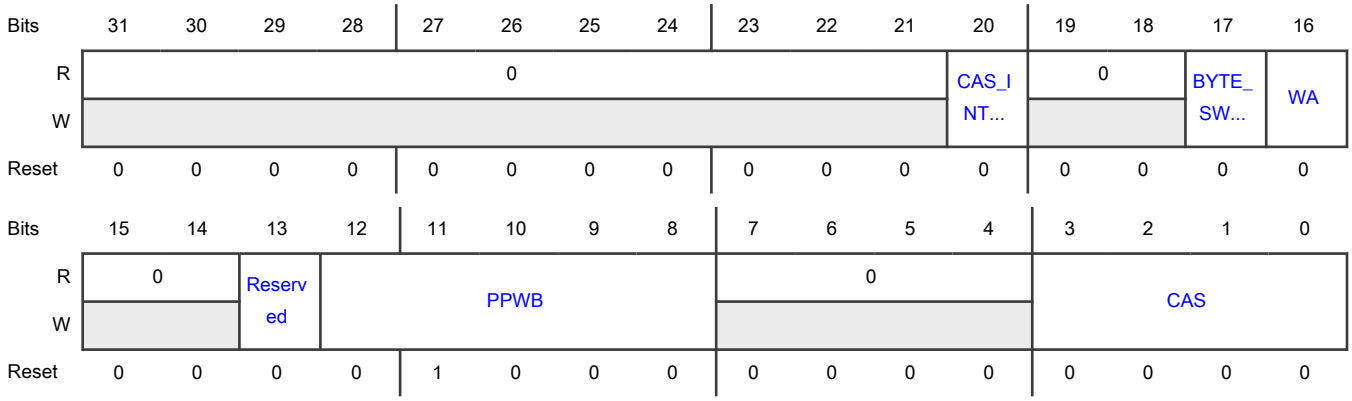
Function

This register contains the address requirements that are specific to serial flash memory. These requirements must be configured according to the connected flash memory, for the controller to function properly. The module automatically translates the address of SFAR on the memory map or the incoming address on the AHB bus to the column address on the flash memory. For example, if a flash memory needs 3 bits as its column address, then only the lower three bits of the SFAR/AHB address are sent to the flash memory as its column address. The software should ensure that the serial flash memory address provided in SFAR or the incoming AHB address lies in the valid flash memory address range.

Special write-access is permitted if:

- SR[IP_ACC] = 0
- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-21 —	Reserved
20 CAS_INTRLVD	CAS Interleaving 0b - CAS interleaving is disabled 1b - CAS interleaving is enabled
19-18 —	Reserved
17 BYTE_SWAP	Byte swapping In case of Octal DDR mode, this field controls whether a word unit composed of 2 bytes from posedge and negedge of a single DQS cycle needs to be swapped. 0b - One word of two bytes at [nth, n+1th] address 1b - One word of two bytes at [n+1th, nth] address
16 WA	Word addressable Defines whether the serial flash memory is a byte addressable flash memory or a word addressable flash memory. According to the configuration of this field, the address is remapped to the flash memory interface. See Address scheme for details. 0b - Byte addressable serial flash memory mode 1b - Word (2-byte) addressable serial flash memory mode
15-14 —	Reserved
13 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
12-8 PPWB	Page program boundary Flash memory-specific page program boundary size should be programmed in Log2 (size in bytes) format. The default is 8 = log2(256) for a 256-byte page program size.
7-4 —	Reserved
3-0 CAS	Column address space Defines the width of the column address. If the column address is, for example, [2:0] of SFAR/AHB address, then CAS must be 3. If there is no column address separation in any serial flash memory, the value of this field must be specified as 0.

80.14.2.19 Sampling Register (SMPR)

Offset

Register	Offset
SMPR	108h

Function

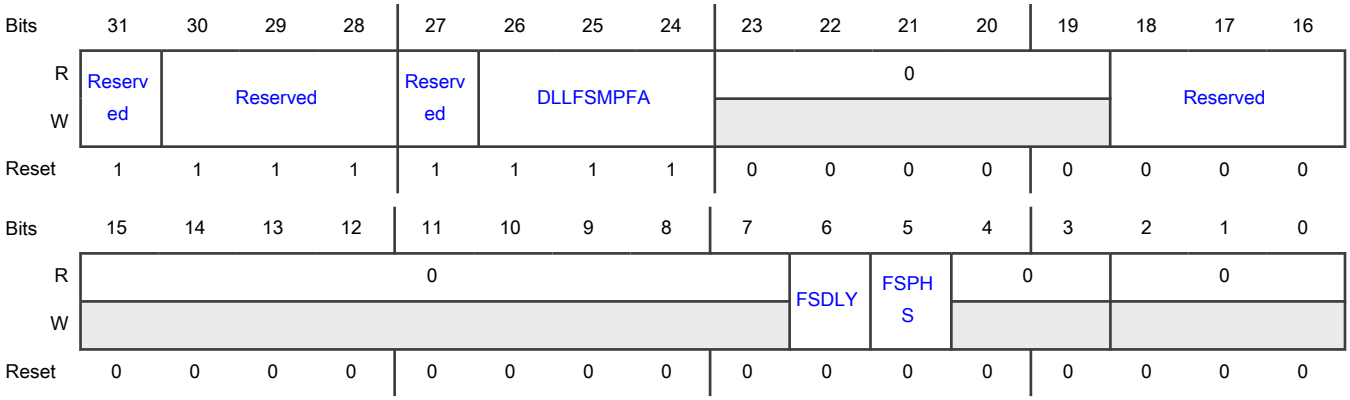
This register allows configuration of how the incoming data from the external serial flash memory devices is sampled in the QuadSPI module.

NOTE

See the chip data sheet for programming the register fields.

Special write-access is permitted in the disabled mode.

Diagram



Fields

6 FSDLY	Full-speed delay selection for internal/pad loop back DQS sampling This field selects the delay in accordance with the reference edge for the valid sample point. 0b - Same DQS 1b - Half-cycle early DQS
5 FSPHS	Full-speed phase selection for SDR instructions This field selects the edge of the sampling clock valid for full-speed commands. 0b - Select sampling at non-inverted clock 1b - Select sampling at inverted clock
4-3 —	Reserved
2-0 —	Reserved

80.14.2.20 RX Buffer Status Register (RBSR)

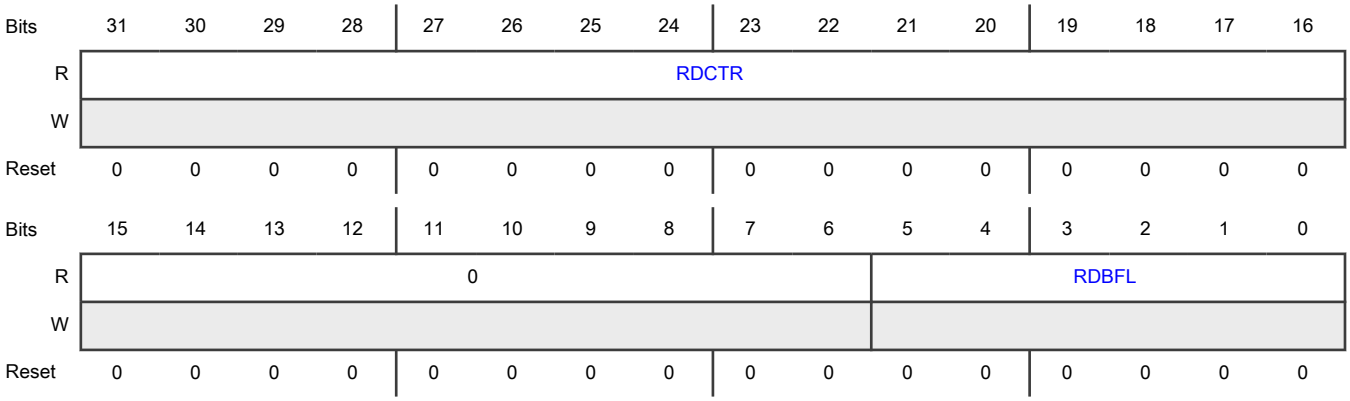
Offset

Register	Offset
RBSR	10Ch

Function

This register contains information related to the receive data buffer.

Diagram



Fields

Field	Function
31-16 RDCTR	Read counter Indicates the number of 4-byte entries removed from the RX buffer. For example, a value of 0x2 indicates that 8 bytes have been removed. It is incremented by the number (RBCT[WMRK] + 1) on RX buffer POP event. The RX buffer can be popped using DMA or FR[RBDF]. The RSER[RBDDE] defines which pop should be pursued. For details, see AHB RX Data Buffer Register (ARDB0 - ARDB31) and Data Transfer from the QuadSPI Module Internal Buffers.
15-6 —	Reserved
5-0 RDBFL	RX buffer fill level Indicates the number of 4-byte entries available in the RX buffer. For example, a value of 0x2 indicates 8 bytes are available.

80.14.2.21 RX Buffer Control Register (RBCT)

Offset

Register	Offset
RBCT	110h

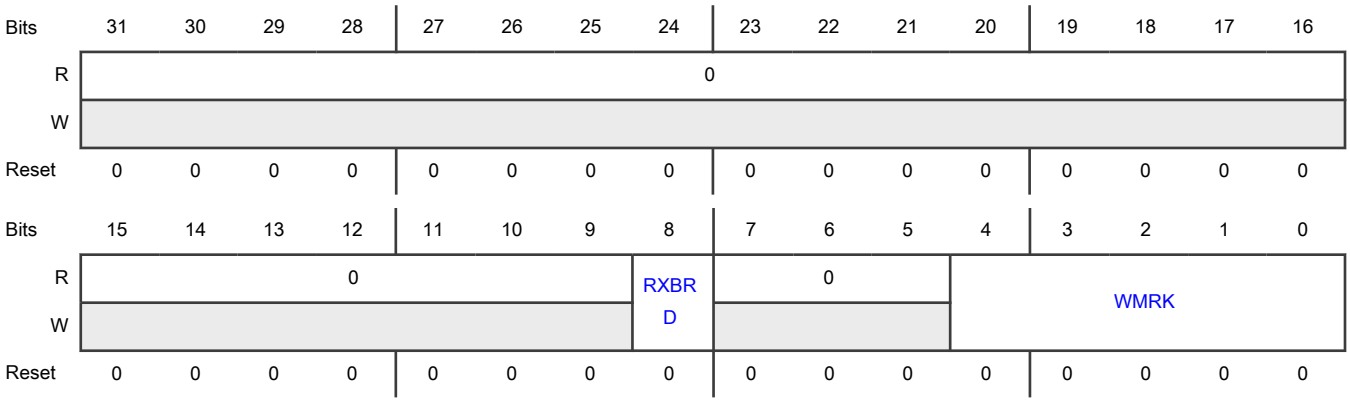
Function

This register contains control data related to the receive data buffer.

Special write-access is permitted if:

- SR[IP_ACC] = 0

Diagram



Fields

Field	Function
31-9 —	Reserved
8 RXBRD	RX buffer readout This field specifies the access scheme for the RX buffer readout. 0b — RX buffer content is read using the AHB bus registers. See AHB RX Data Buffer Register (ARDB0 - ARDB31). 1b — RX buffer content is read using the IP bus registers. See RX Buffer Data Register (RBDR0 - RBDR31).
7-5 —	Reserved
4-0 WMRK	RX buffer watermark

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field determines when the readout action of the RX buffer is triggered. When the number of valid entries in the RX buffer is equal to or greater than the number provided by (WMRK+1), the SR[RXWE] flag is asserted. The value should be entered as the number of 4-byte entries minus 1. For example, a value of 0x0 sets the watermark to 4 bytes, 1 to 8bytes, 2 to 12 bytes, and so on. For details, see DMA usage. **NOTE** This field should never be programmed above 31 because there are only 32 memory mapped RBDR registers. If watermark is programmed above 31, data above 32 words will be lost.

80.14.2.22 AHB Write Status Register (AWRSR)

15 DLLA_LOCK	DLL A lock status
14 SLVA_LOCK	Slave high lock status High-frequency slave delay chain locked. The field is configured when the slave decoder is updated with DLLCRA[SLV_UPD] and is reset after you configure SLV_UPD to 0.
13 DLLA_RANGE_ERR	DLL master delay chain The value 1 indicates that DLL master delay chain is working out of delay range because of incorrect DLL configuration.
12 DLLA_FINE_UNDERFLOW	Fine delay chain underflow The value 1 indicates that fine delay chain underflow has occurred.
11-8 —	Reserved
7-4 DLLA_SLV_FINE_VAL	Fine delay cells in slave delay chain This value indicates the total number of fine delay cells (1 delay unit) selected in the slave delay chain.
3-0 DLLA_SLV_COARSE_VAL	Coarse delay cells in slave delay chain This value indicates the total number of coarse delay cells (16 delay units) selected in the slave delay chain.

80.14.2.24 Data Learning Configuration Register (DLCR)

Offset

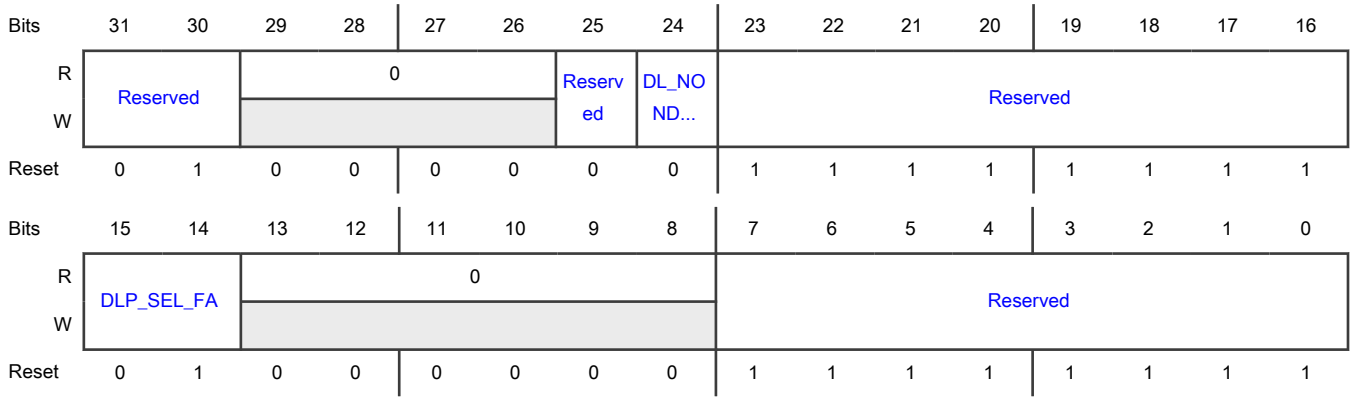
Register	Offset
DLCR	130h

Function

This register is used for programming the data learning settings.

- A flash memory device that supports data learning but cannot provide more than 10 bits of data learn pattern must be considered as non-DLP Flash. For Non-DLP flash devices, you must read at least 16 bits data learn pattern from a known location.
- You must program different learning pattern on the two data pins–IO1 and IO3. This is required to accommodate pessimistic data skew between the different IO lines.

Diagram



Fields

Field	Function
31-30 —	Reserved
29-26 —	Reserved
25 —	Reserved
24 DL_NONDLP_FLSH	Data learning enabled for non-DLP flash memory Configure the value of this field as 1 to enable data learning for flash memories that do not provide a data learning pattern. For a non-DLP flash memory, execute a one-time data learning through the IPS to select a tap before an AHB read operation.
23-16 —	Reserved
15-14 DLP_SEL_FA	Selects pattern matching IO pads 00b - Pattern matching is ignored. This is only for debugging purpose and should not be programmed. 01b - IO1 is used for matching 10b - IO3 is used for matching. This is only for debugging purpose and should not be programmed. 11b - Both IO1 and IO3 are used for pattern matching
13-8 —	Reserved

Field	Function
7-0 —	Reserved

80.14.2.25 Data Learning Status Flash Memory A Register (DLSR_FA)

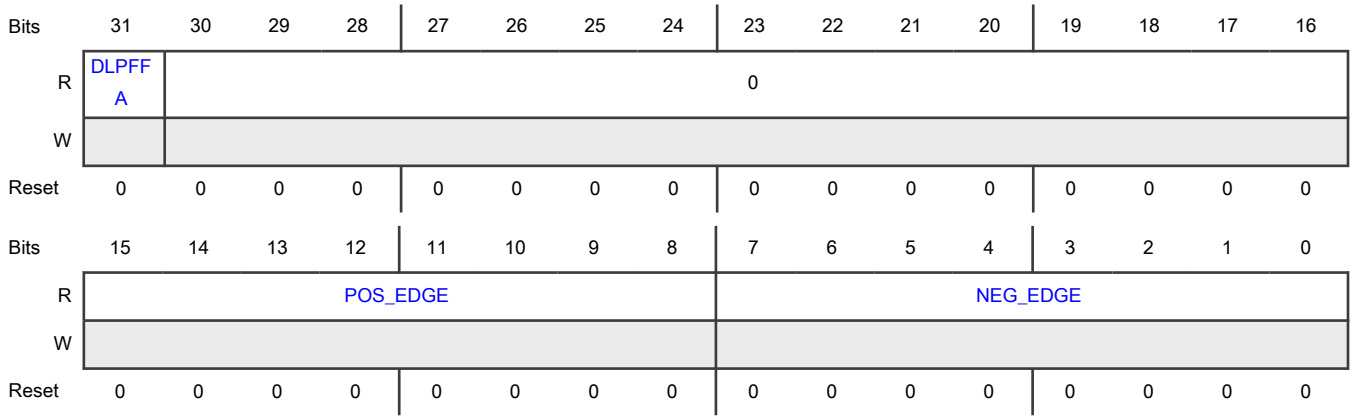
Offset

Register	Offset
DLSR_FA	134h

Function

This register shows sampling point selected by data learning algorithm when the value of DLSR_FA[DLPFFA] is 0. Otherwise, it shows the pattern matching outline.

Diagram



Fields

Field	Function
31 DLPFFA	Data learning pattern fail This field asserts when data learning fails at flash memory A.
30-16 —	Reserved
15-8 POS_EDGE	DLP positive edge match signature for flash memory A
7-0 NEG_EDGE	DLP negative edge match signature for flash memory A

80.14.2.26 TX Buffer Status Register (TBSR)

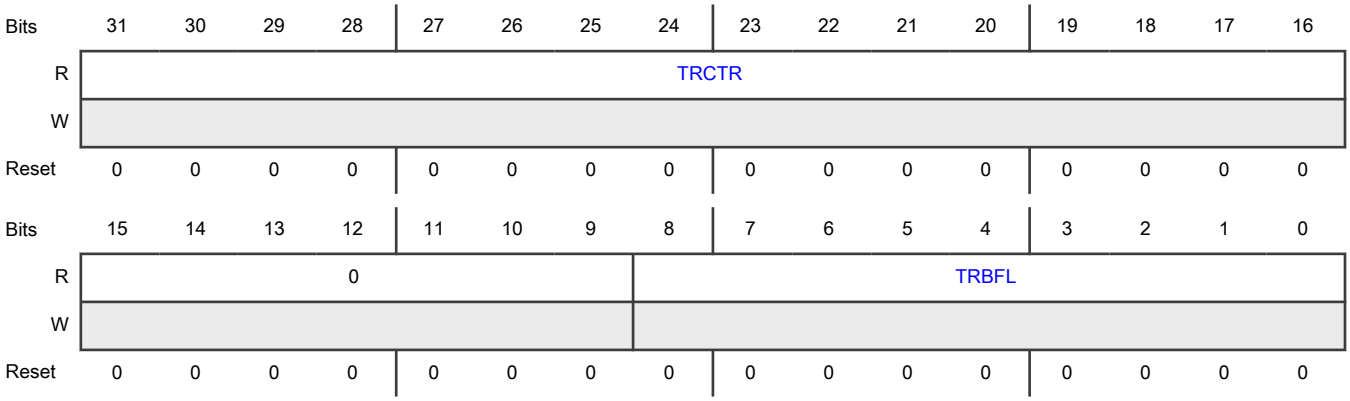
Offset

Register	Offset
TBSR	150h

Function

This register contains information related to the transmit data buffer.

Diagram



Fields

Field	Function
31-16 TRCTR	Transmit counter This field indicates how many entries of 4 bytes have been written into the TX buffer by host accesses. It is reset to 0 when a 1 is written to MCR[CLR_TXF]. It is incremented on each write access to the TBDR register when another word has been pushed onto the TX buffer. When it is not cleared, the TRCTR field wraps around to 0. See TX Buffer Data Register (TBDR) for details.
15-9 —	Reserved
8-0 TRBFL	TX buffer fill level This field contains the number of entries of 4 bytes each available in the TX buffer for the QuadSPI module to transmit to the serial flash memory device. The value of this field can reach maximum up to the total TX buffer size.

80.14.2.27 TX Buffer Data Register (TBDR)

Offset

Register	Offset
TBDR	154h

Function

This register provides access to the circular TX buffer of depth 256, so the total size is 256 * 4 bytes. This buffer provides the data written into it as write data for the page programming commands to the serial flash memory device. See Table 693 for the byte ordering scheme. A write transaction on the flash memory with data size of less than 32 bits leads to the removal of one data entry from the TX buffer. The valid bits are used and the rest of the bits are discarded.

Special write-access is permitted if:

- SR[TXFULL] = 0

NOTE

This register can only be written when write access is granted by SFP block else bus transfer error is generated on write. Please refer to section TBDR register write lock

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	TXDATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TXDATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TXDATA	TX data On write access, the data is written to the next available entry of the TX buffer and TBSR[TRBFL] is updated accordingly. On a read access, the last data written to the register is returned.

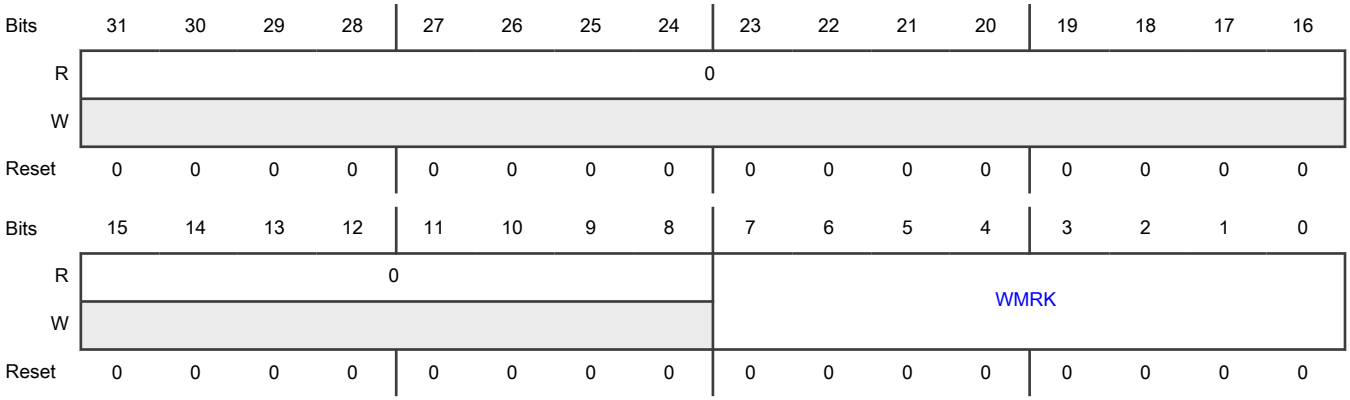
80.14.2.28 TX Buffer Control Register (TBCT)

Offset

Register	Offset
TBCT	158h

Function
This register contains control information for transmit data buffer.

Diagram



Fields

Field	Function
31-8 —	Reserved
7-0 WMRK	Watermark for TX buffer Determines the watermark for the TX buffer When the number of available space in the TX buffer is greater than or equal to the number provided by WMRK (number of 4-byte entries), SR[TXWA] is asserted. For example, a value of 0x1 sets the watermark to 4 bytes, 0x2 sets it to 8 bytes, 0x3 sets it to 12 bytes, and so on. For details, see DMA usage. WMRK = 0 is invalid. **NOTE** For IPS write with SFP enabled, this field must be programmed as per formula to prevent TX underflow: If data size in words >1, watermark=(TX FIFO size in words - data size in words) +1, If data size in words =1, watermark=(TX FIFO size in words - data size in words)

80.14.2.29 Status Register (SR)

Offset

Register	Offset
SR	15Ch

Function

This register provides all the available status information about SFM command execution and arbitration, the RX buffer, TX buffer, and the AHB buffer.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-29 —	Reserved
28 —	Reserved
27 TXFULL	TX buffer full Asserted when the FIFO level reaches TX buffer size
26 TXDMA	TX DMA Asserted when the TXFIFO fill via DMA is active and DMA is requested or running
25 TXWA	TX buffer watermark available Asserted when the number of available spaces in the TX buffer is greater than or equal to the value provided by TBCT[WMRK] Example: When TBCT[WMRK]=1, SR[TXWA] is de-asserted when TX FIFO has 256 entries.

Table continues on the next page...

Table continued from the previous page...

Field	Function
24 TXNE	TX buffer not empty Asserted when TX buffer contains data
23 RXDMA	RX buffer DMA Asserted when RX buffer read out via DMA is active; that is, when DMA is requested or running
22-20 —	Reserved
19 RXFULL	RX buffer full Asserted when the RX buffer is full; that is, when RBSR[RDBFL] is equal to 32
18-17 —	Reserved
16 RXWE	RX buffer watermark exceeded Asserted when the number of valid entries in the RX buffer exceeds the number provided in RBCT[WMRK]
15 —	Reserved
14 AHB3FUL	AHB 3 buffer full Asserted when AHB 3 buffer is full
13 AHB2FUL	AHB 2 buffer full Asserted when AHB 2 buffer is full
12 AHB1FUL	AHB 1 buffer full Asserted when the AHB 1 buffer is full
11 AHB0FUL	AHB 0 buffer full Asserted when the AHB 0 buffer is full
10 AHB3NE	AHB 3 buffer not empty Asserted when the AHB 3 buffer contains data
9 AHB2NE	AHB 2 buffer not empty Asserted when the AHB 2 buffer contains data
8 AHB1NE	AHB 1 buffer not empty Asserted when the AHB 1 buffer contains data
7	AHB 0 buffer not empty

Table continues on the next page...

Table continued from the previous page...

Field	Function
AHB0NE	Asserted when the AHB 0 buffer contains data
6 AHBTRN	AHB access transaction pending Asserted when there is a pending request on the AHB interface. See Flash memory mapped AMBA bus.
5 —	Reserved
4 AWRACC	AHB write access Asserted when AHB write access is enabled
3 —	Reserved
2 AHB_ACC	AHB read access Asserted when the currently executed transaction is initiated by the AHB bus
1 IP_ACC	IP access Asserted when transaction currently executed is initiated by the IP bus
0 BUSY	Module busy Asserted when module is currently busy handling a transaction to an external flash memory device

80.14.2.30 Flag Register (FR)

Offset

Register	Offset
FR	160h

Function

This register provides all available flags about SFM command execution and arbitration, which may serve as the source for the generation of interrupt service requests. Note that the error flags in this register do not relate directly to the execution of the transaction in the serial flash memory device itself but only to the behavior and conditions visible in the QuadSPI module.

Special write-access is permitted in the enabled mode.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31 DLPFF	Data learning pattern failure flag This field is set when the DATA_LEARN instruction is encountered in a sequence, but no sampling point is found for the data learning pattern.
30 —	Reserved
29 —	Reserved
28 DLLABRT	DLL abort 1b - This field is set whenever DLL is unlocked while reading data from the flash memory.
27 TBFF	TX buffer fill flag Before writing to the TX buffer, this field should be cleared. Then, it should be read back. If it is set, the TX buffer can include more data. If the field remains cleared, the TX buffer can be considered as full. See TX buffer operation for details.
26 TBUF	TX buffer underrun flag This field is set if the module tries to pull data when the TX buffer is empty.. The IP command leading to the TX buffer underrun is continued (data sent to the serial flash memory device is undefined). Here, a valid underrun means that it should have occurred during the transaction so that few bytes (that is, less than 4 bytes) are left in FIFO and the remaining are filled with "FFFFh". This field does not set if transfer is less than 128 bits. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF]. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF].
25 —	Reserved
24	DLL unlock

Table continues on the next page...

Table continued from the previous page...

Field	Function
DLLUNLCK	1b - This field is set whenever DLL unlock event occurs, irrespective of flash memory access.
23 ILLINE	Illegal instruction error flag This field is set when an illegal instruction is encountered by the controller in any of the sequences. As soon as the field is set, you must assert MCR[SWRSTSD] and MCR[SWRSTHD]. That is, reset the flash memory and AHB domain after reconfiguring the correct sequence instruction. See Table 691 for a list of legal instructions.
22-21 —	Reserved
20 —	Reserved
19-18 —	Reserved
17 RBOF	RX buffer overflow flag This field is set when no more data can be pushed into the RX buffer from the serial flash memory device. The IP command leading to this condition is continued until the number of bytes in IPCR[IDATSZ] are read from the serial flash memory device. The content of the RX buffer remains unchanged.
16 RBDF	RX buffer drain flag This field is set if SR[RXWE] is asserted. Writing 1 to this field triggers one of the following actions: • If the RX buffer has up to RBCT[WMRK] valid entries, then the flag is cleared. • If the RX buffer has more than RBCT[WMRK] valid entries and the RSER[RBDDE] field is not set (flag driven mode), an RX buffer POP event is triggered. The flag remains set if the RX buffer contains more than RBCT[WMRK] valid entries after the RX buffer POP event is complete. The flag is cleared if the RX buffer contains less than or equal to RBCT[WMRK] valid entries after the RX buffer POP event is complete. See the "Receive Buffer Drain Interrupt or DMA Request" section in Normal mode interrupt and DMA requests for details.
15 AAEF	AHB abort error flag This flag can be set when AHB transaction in ongoing and any of the below conditions occur which may result in AHB error response (HRESP) generation: • When Software abort is asserted from SPTRCLT[ABRT_CLR] during AHB read.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• During data learning pattern failure if any AHB transaction is ongoing. (FR[DLPFF]) • CRC or ECC error from flash memory during AHB transaction. (FR[CRCAEF]) • If AIBSEF flag is set during the AHB transfer. (FR[AIBSEF]) Software should clear this flag and other related flags in FR register (mentioned in points above) before initiating any new AHB transfer.
14 AITEF	AHB illegal transaction error flag This is set whenever there is no response generated from QuadSPI to AHB bus in case of an illegal transaction and the watchdog timer expires. The timer value is considered as a parameter.
13 AIBSEF	AHB illegal burst size error flag This is set whenever the total burst size (size x beat) of an AHB transaction is greater than the prefetch data size, which is defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field in case ADATSZ = 0. See HBURST support with AHB read details on HBURST feature.
12 ABOF	AHB buffer overflow flag This is set when the size of the AHB access exceeds the size of the AHB buffer. This condition can occur only if BUFxCR[ADATSZ] is programmed incorrectly. The AHB command leading to this condition is continued until the number of entries according to BUFxCR[ADATSZ] have been read from the serial flash memory device. The content of the AHB buffer is not changed.
11 —	Reserved
10 CRCAEF	Sets when there is CRC or ECC error for flash memory A 0b - CRCEF interrupt is not generated. 1b - CRCEF interrupt is generated.
9 —	Reserved
8 PPWF	Page-program wait flag after flash memory write flag This field indicates page-program wait flag after flash memory write.
7 —	Reserved
6 IPIEF	IP command trigger could not be executed error flag This is set when the SR[IP_ACC] and SR[AWRACC] fields are set (that is, an IP triggered command is currently executing) and any of the following conditions occurs: • Write access to the RBCT
5	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
4 —	Reserved
3-1 —	Reserved
0 TFF	IP command transaction finished flag This field is set after the QuadSPI module completes a running IP command. If an error occurs, and the related error flags are valid in the same clock cycle, the TFF flag is asserted.

80.14.2.31 Interrupt and DMA Request Select and Enable Register (RSER)

Offset

Register	Offset
RSER	164h

Function

This register provides enables and selectors for the interrupts in the QuadSPI module.

NOTE

Each field of the FR enabled as source for an interrupt prevents the QuadSPI module from entering the Stop mode or Module Disable mode when this flag is set.

Special write-access is permitted in the "Anytime" mode.

Field	Function
	1b - TFF interrupt is generated.

80.14.2.32 Sequence Pointer Clear Register (SPTRCLR)

Offset

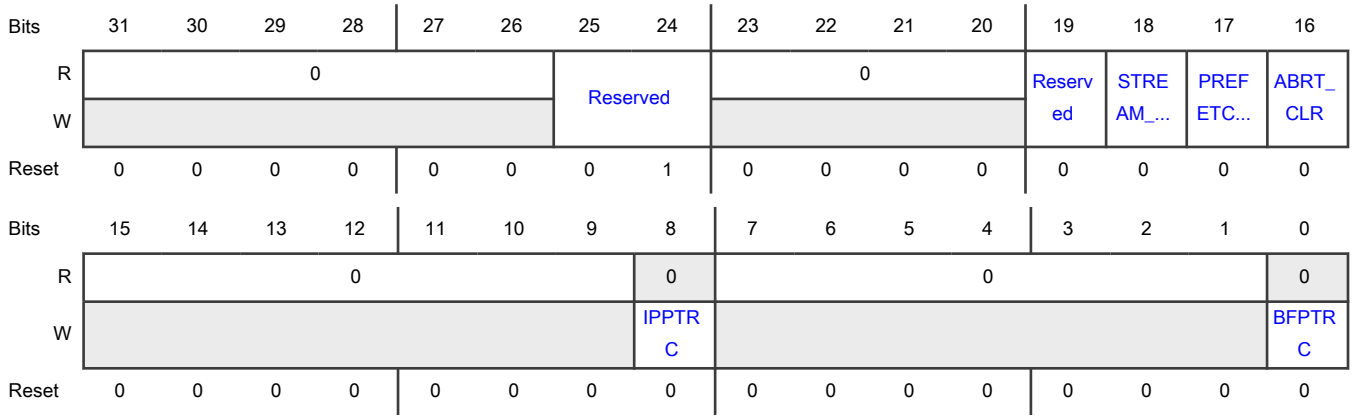
Register	Offset
SPTRCLR	16Ch

Function

This register provides fields to reset the IP and buffer sequence pointers. The sequence pointer contains the index of instructions within the LUT entry that is to be executed next. For example, if the LUT entry ends on a JMP_ON_CS value of 2, the index is stored as 2.

The software should reset the sequence pointers defined by JMP_ON_CS operand whenever the sequence ID is required to be changed by updating the SEQID field in the IPCR or BFGENCR.

Diagram



Fields

Field	Function
31-26 —	Reserved
25-24 —	Reserved
23-20	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
19 —	Reserved
18 STREAM_EN	Enable Streaming Port 1b - Enables AHB read as streaming port with 64K prefetch size.
17 PREFETCH_DIS	Prefetch disable This field should be configured to disable the prefetch mechanism of receiver. It is not based on dynamic programming. Therefore, it should be programmed initially at once. When this field is set, then during an ongoing flash memory read, any subsequent AHB read is checked for buffer hit. However, after the end of flash memory read, as soon as chip select is deasserted, any subsequent AHB read results in flushing of the current AHB buffer data and issues fresh flash memory transaction if the AHB buffer data is not updated with the flash memory.
16 ABRT_CLR	Flash memory Abort/AHB buffer clear This is a dynamic field. Writing a 1 to it, irrespective of the prefetch disable, clears the AHB buffer pointers and also aborts any ongoing flash memory transaction (if any) and rejects any ongoing AHB read with an error response (if any). QuadSPI sets this field to 0 after clearing the AHB buffer pointers.
15-9 —	Reserved
8 IPPTRC	IP pointer clear This is a self-clearing field. 1b - Clears the sequence pointer for IP accesses as defined in IPCR.
7-1 —	Reserved
0 BFPTRC	Buffer pointer clear This is a self-clearing field. 1b - Clears the sequence pointer for AHB read accesses as defined in BFGENCR.

80.14.2.33 Serial Flash Memory A1 Top Address Register (SFA1AD)

Offset

Register	Offset
SFA1AD	180h

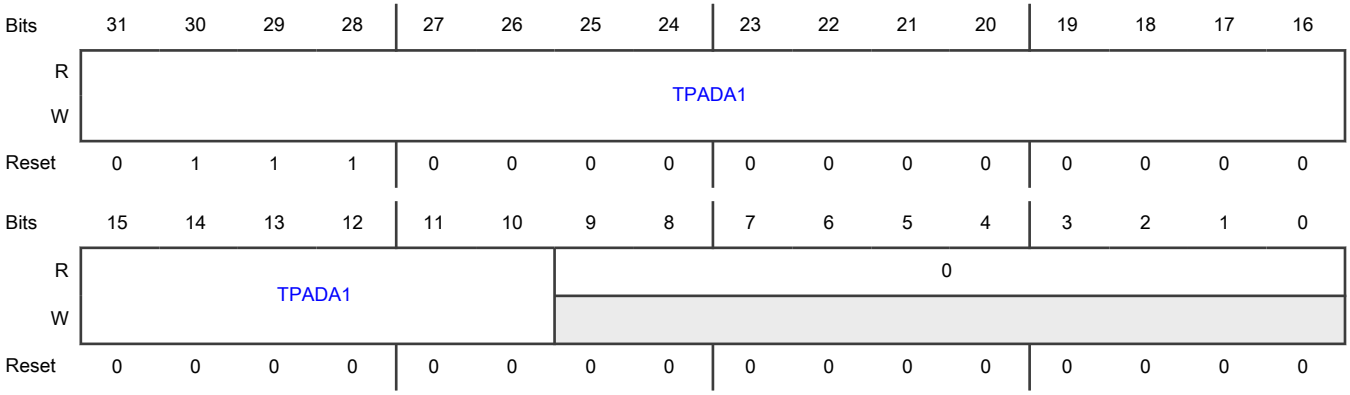
Function

This register provides the address mapping for serial flash memory A1. The difference between SFA1AD[TPADA1] and AMBA_BASE defines the size of the memory map for serial flash memory A1.

Special write-access is permitted if:

- SR[IP_ACC] = 0
- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-10 TPADA1	Top address for serial flash memory A1 In effect, TPADxx is the first location of the next memory.

80.14.2.35 Data Learn Pattern Register (DLPR)

Offset

Register	Offset
DLPR	190h

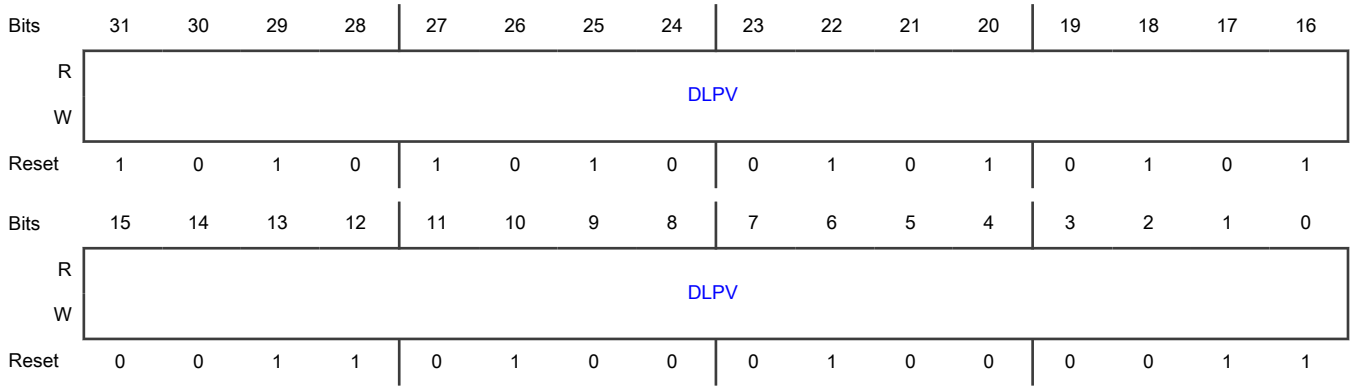
Function

This register contains the information of the data to be used for data learning.

Special write-access is permitted if:

- SR[IP_ACC] = 0
- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-0 DLPV	Data learning pattern value This value is used for data learning in the DDR and DQS modes. For example, if you request for more than 32 bits of data learning, the value is repeated in the register. For example, if 64-bit data learning is requested by any flash memory and the value of DLPR is aa55_3443, then the 64-bit value is aa55_3443_aa55_3443. This value is used for data learning in SDR/DDR modes along with DATA_LEARN instruction. Different patterns can be matched at selected IOs. That is, IO1 and IO3 using DLCR[DLP_SEL_FA], DLPR[31:16] for IO3, and DLPR[15:0] for IO1. DLP pattern for IO1 and IO3 should be stored, bit-wise, in the little endian format. For details, see Data learning.

80.14.2.36 Flash Memory A Failing Address Status Register (FAILA_ADDR)

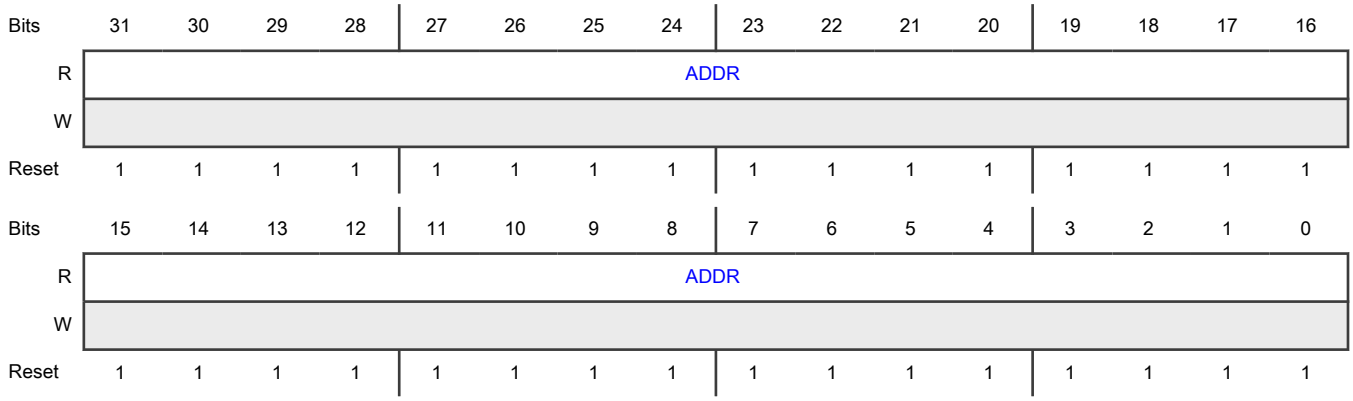
Offset

Register	Offset
FAILA_ADDR	194h

Function

This register provides the flash memory address where data learning or parity error has occurred.

Diagram



Fields

Field	Function
31-0 ADDR	Failing address for flash memory A

80.14.2.37 RX Buffer Data Register (RBDR0 - RBDR31)

Offset

For a = 0 to 31:

Register	Offset
RBDRa	200h + (a × 4h)

Function

These registers provide access to individual entries in the RX buffer. See Table 693 for the byte ordering scheme.

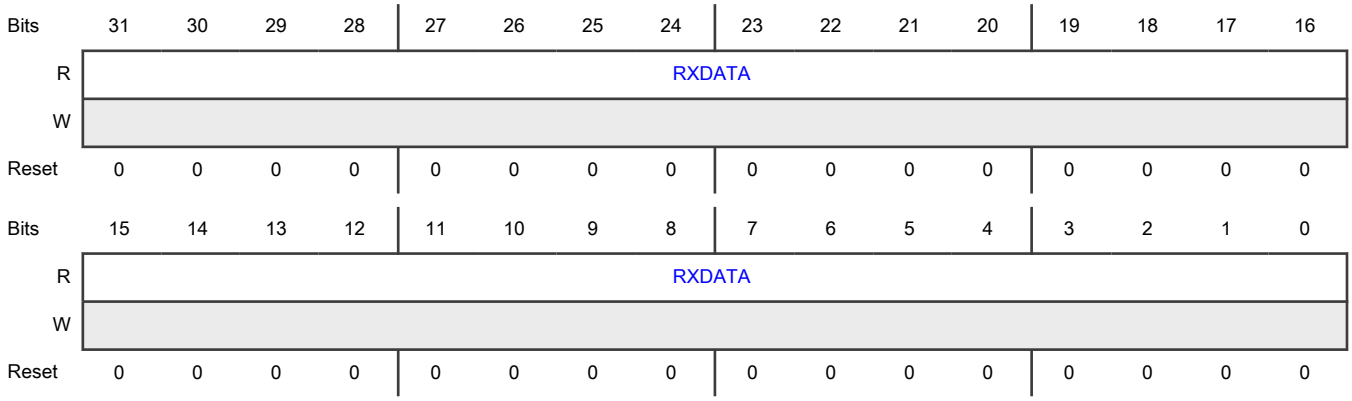
RBDR0 corresponds to the actual position of the read pointer within the RX buffer. The number of valid entries available depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

Example 1 - RX buffer filled completely with 32 words: In this case, the address range for valid read access extends from RBDR0 to RBDR31 RBDR63.

Example 2 - RX buffer filled with five valid words: RX buffer fill level of RBSR[RDBFL] is 5. In this case, access to RBDR4 provides the last valid entry.

Any access beyond the range of valid RX buffer entries provides undefined results.

Diagram



Fields

Field	Function
31-0 RXDATA	RX data This field contains the data associated with the related RX buffer entry. For data format and byte ordering, see Byte ordering of serial flash memory read data.

80.14.2.38 LUT Key Register (LUTKEY)

Offset

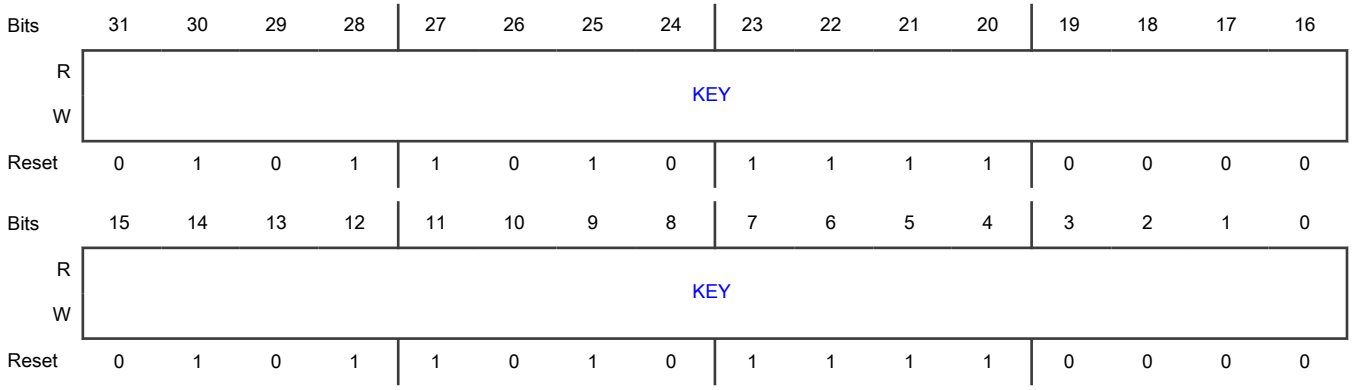
Register	Offset
LUTKEY	300h

Function

This register contains the key to lock and unlock the LUT. See LUT for details.

Special write-access is permitted in the "Anytime" mode.

Diagram



Fields

Field	Function
31-0 KEY	Key to lock or unlock the LUT The key is 0x5AF05AF0 and the read value is always 0x5AF05AF0.

80.14.2.39 LUT Lock Configuration Register (LCKCR)

Offset

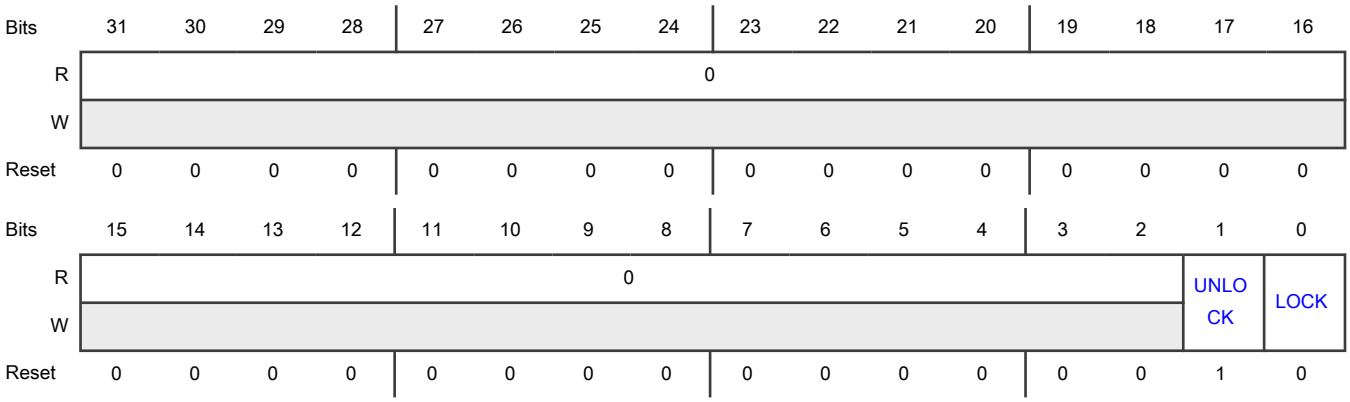
Register	Offset
LCKCR	304h

Function

This register is used along with the LUTKEY register to lock or unlock the LUT. This register should be written immediately after the LUTKEY register for the lock or unlock operation to be successful. See LUT for details. Setting both the LOCK and UNLOCK bits as "00" or "11" is not allowed.

Special write access is permitted after writing the LUT key register.

Diagram



Fields

Field	Function
31-2 —	Reserved
1 UNLOCK	Unlock LUT Unlocks the LUT when the following two conditions are met: • This register is written just after the LUT Key Register (LUTKEY). • The LUT key register was written with the 0x5AF05AF0 key.

Table continues on the next page...

Table continued from the previous page...

Field	Function
0 LOCK	Lock LUT Locks the LUT when the following conditions are met: • This register is written just after the LUT Key Register (LUTKEY). • The LUT key register is written with the 0x5AF05AF0 key.

80.14.2.40 LUT Register (LUT0)

Offset

Register	Offset
LUT0	310h

Function

A sequence of instruction-operand pairs may be pre-populated in the LUT according to the device connected on board. Each instruction-operand pair is of 16 bits (2 bytes) each. Every sequence preprogrammed by Program Sequence Engine in the LUT is referred to by its index. The LUT registers act as lookup tables for sequences of instructions. The programmable sequence engine executes the instructions in these sequences to generate a valid serial flash memory transaction. There are a total of 80 LUT registers. These 80 registers are divided into groups of 5 registers that make a valid sequence. Therefore, LUT[0], LUT[5], LUT[10] ..... LUT[75] are the starting registers of a valid sequence. Each of these sets of 5 registers can have a maximum of 10 instructions. Reset value of the register shown below is only applicable to LUT2 to LUT79. A maximum of 16 sequences can be defined at one time. See LUT that describes the LUT registers in detail.

Special write-access is permitted if the LUT is unlocked.

This register is access controlled and can only be programmed by privilege masters. Last six LUT SEQID locations should be used for programming SEQID for atomic commands (where flash's internal config region is accessed) like flash erase etc. where data transfer is not required. These 6 SEQID can be send to QSPI using only FRAD0 and can't be qualified using any other FRAD. For details, see Atomic commands considerations.

NOTE
The software must program the value 101 for MDACP fields for FRAD0 as this FRAD has access to all the atomic instructions. For details, see Atomic commands considerations.</td></tr>
</table>

80.14.2.46 Flash Region Lock Control (FRAD0_WORD3 - FRAD7_WORD3)

Offset

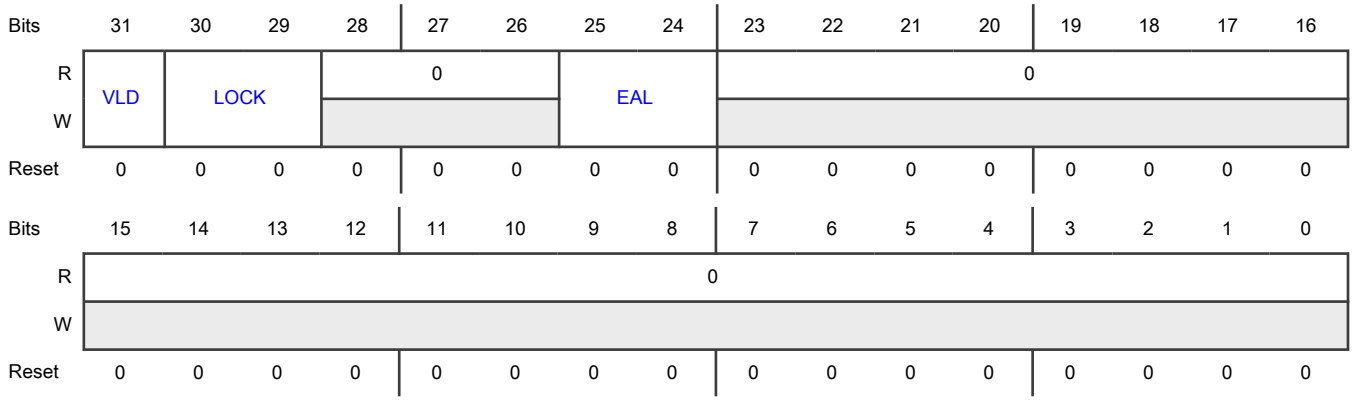
For n = 0 to 7:

Register	Offset
FRADn_WORD3	80Ch + (n × 20h)

Function

This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31 VLD	Valid This field indicates whether the FRAD Descriptor for a specific flash region is valid. This field can not be written in same cycle if EAL field is being written as 10 or 11. **NOTE** You must enable this field after programming FRAD0_WORD0, FRAD0_WORD1, FRAD0_WORD2 and FRAD0_WORD3 registers. 0b - FRAD-Assignment is invalid 1b - FRAD-Assignment is valid
30-29 LOCK	Descriptor Lock This field enables masking of accidental write on FRAD registers. Lock is enabled/disabled by Secure/ Privileged master. Lock functionality does not affects the EAL bits of FRAD. They can still be written even if FRAD descriptors are locked. 00b-01b - Lock disabled. Descriptor registers can be written by any master 10b - Lock enabled. Descriptors are read-only. MDnACP fields can be programmed only by the master with ID matching the MID check of their respective Target group MDAD. If the Target group MDAD is not valid then MDnACP fields also become read-only. 11b - Lock enabled. Descriptor registers are read-only.
28-26 —	Reserved
25-24 EAL	Exclusive Access Lock This field provides exclusive write lock over a FRAD region based on MD*n*ACP. 00b - No lock. Write permissions available for all masters based on their MDxACP evaluation. 01b - NA

Table continues on the next page...

Table continued from the previous page...

Field	Function
	10b - Lock enabled. Write permissions revoked for all domains. It can only be changed to 11b and can't directly be changed to 00b. 11b - Lock enabled. Exclusive write permission for master with master ID given in FRADn_WORD3[EALO] fields based on its MDxACP evaluation. Write disabled for other masters. Exclusive lock can be taken by a master only if it its ID matches the master ID check of any of the MDAD target queue, which is valid. MDxACP field corresponding to that target queue is not programmed as 0b. when a master writes 11b on this field it will be written only if above condition is met and then the master ID will be stored in FRADn_WORD3[EALO]. No transfer error will be generated in case the master does not satisfies the check.
23-0 —	Reserved

80.14.2.47 Flash Region Compare Address Status (FRAD0_WORD4 - FRAD7_WORD4)

Offset

For n = 0 to 7:

Register	Offset
FRADn_WORD4	810h + (n × 20h)

Function

This register is access controlled and can only be programmed by privilege masters.

NOTE

Any write access to these registers will result in bus transfer error

31-0 SFARADDR	SFAR Address Flash memory start address of the transaction which qualified into this target group queue.

80.14.2.51 Target Group n SFAR Status (TG0SFARS - TG1SFARS)

Offset

Register	Offset
TG0SFARS	908h
TG1SFARS	918h

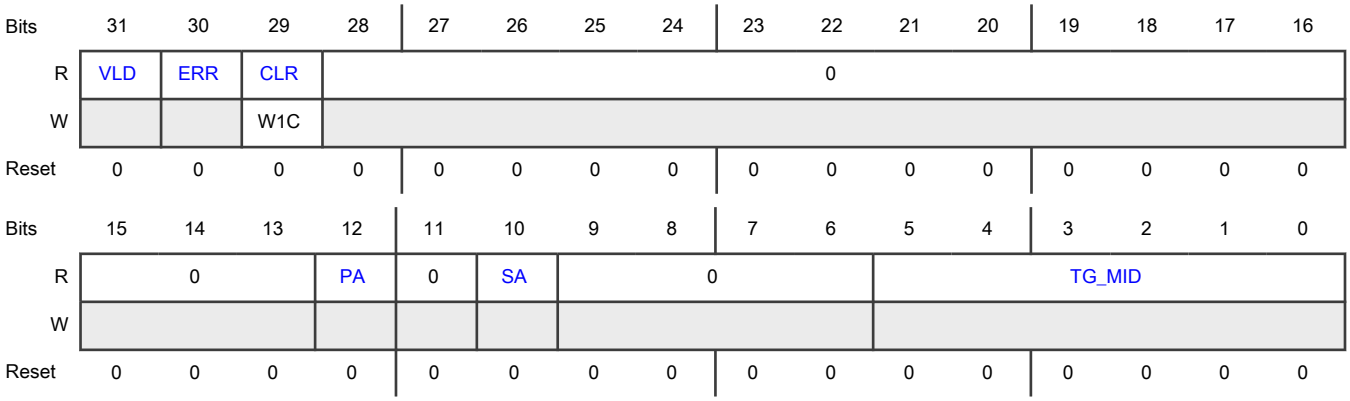
Function

Target group *n* SFAR status.

NOTE

This register can only be read if the master reading the register passes the security checks set in TGnMDAD[SA] fields or if MDAD descriptor is not valid. Else this register will be read as 0. It will also read as 0 if TGnMDAD[SA] bits in descriptor are set as 00.

Diagram



Fields

Field	Function
31 VLD	Valid Indicates whether the SFAR Address for the target group *n* is valid and queue is busy. This bit will not be set when ERR bit is set. 0b - SFAR-Assignment is invalid 1b - SFAR-Assignment is valid
30 ERR	Error Indicates whether the SFAR address stored by a Master is with required access attributes for this target group descriptor. 0b - SFAR with required attributes 1b - SFAR without required attributes

Table continues on the next page...

Table continued from the previous page...

Field	Function
29 CLR	Clear Clears the SFAR Status register. This register can only be cleared by the master having security attribute defined by TG*n*MDAD[SA]. After clearing if there is any valid transaction present in MDAD queue, it will again get updated in this register else it will be cleared. It will not be cleared if TGxMDAD[SA] bits are set to 00.
28-13 —	Reserved
12 PA	Privileged Attribute Privilege attribute of the master which wrote the SFAR register. 0b - Non-privileged 1b - Privileged
11 —	Reserved
10 SA	Secure Attribute Secure attribute of the master which wrote the SFAR register. 0b - Non-secure 1b - Secure
9-6 —	Reserved
5-0 TG_MID	Transaction Master ID Indicates the Master-ID of a transaction which programmed the SFAR registers with required attributes.

80.14.2.52 Target Group n IPCR Status (TG0IPCRS - TG1IPCRS)

Offset

Register	Offset
TG0IPCRS	90Ch
TG1IPCRS	91Ch

Function
Target group *n* IPCR status.

NOTE

This register can only be read if the master reading the register passes the security checks set in TGnMDAD[SA] fields or if MDAD descriptor is not valid. Else this register will be read as 0. It will also read as 0 if TGnMDAD[SA] bits in descriptor are set as 00.

Fields

Field	Function
31 VLD	Valid Indicates whether the IPCR-IDATZ, IPCR-SEQID and PAR stored in this target group queue is valid and queue is locked. This bit will not be set in case ERR is set. 0b - IPCR-assignment is invalid 1b - IPCR-assignment is valid and queue is locked.
30-29 ERR	Error Indicates whether the IPCR stored by a Master with required access attributes wrt target group MDAD 00b - IPCR programming with required attributes 01b - IPCR-DATZ programming without required attributes 10b - IPCR-SEQID programming without required attributes 11b - IPCR-DATZ and SEQID both programming without required attributes
28 CLR	Clear Clears the status in IPCR Status register. This register can only be cleared by the master having security attribute defined by TGnMDAD[SA]. After clearing if there is any valid transaction present in MDAD queue it will again get updated in this register else it will be cleared. It will not be cleared if TGxMDAD[SA] bits are set to 00.
27-23 —	Reserved
22	Arbitration Unlock

Table continues on the next page...

Table continued from the previous page...

Field	Function
ARB_UNLOCK	Specifies if the arbitration unlock is requested for TGn. 0b - No effect 1b - Arbitration unlock is requested
21 ARB_LOCK	Arbitration Lock Specifies if the arbitration lock is requested for TGn. 0b - No effect 1b - Arbitration lock is requested
20 PAR	Parallel Mode Enable Value Indicates the parallel mode enable value programmed in the target group queue.
19-16 SEQID	SEQID Value Indicates the SEQID value programmed in target group queue.
15-0 IDATSZ	IDATSZ Value Indicates the IDATSZ value programmed in target group queue.

80.14.2.53 Master Global Configuration (MGC)

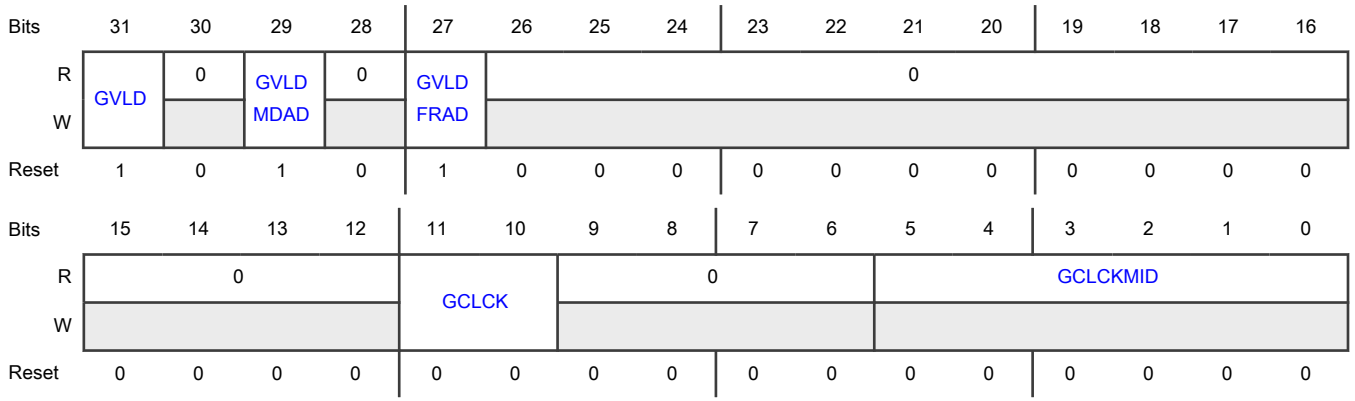
Offset

Register	Offset
MGC	920h

Function

This register is access controlled. It can only be programmed by master with master ID equal to 000011b. For MGC, MRC and MTO registers access checks master ID is being used. For transaction level checks inside MDAD and FRAD domain IDs are being used.

Diagram



Fields

Field	Function
31 GVLD	Global Valid access control 0b - Access controls are disabled. No descriptor comparison check. All transactions are allowed. 1b - Access controls are enabled.
30 —	Reserved
29 GVLDMDAD	Global Valid MDAD 0b - MDADs are disabled 1b - MDADs are enabled
28 —	Reserved
27 GVLDFRAD	Global Valid FRAD 0b - FRADs are disabled 1b - FRADs are enabled
26-12 —	Reserved
11-10 GCLCK	Global Configuration Lock This field provides a mechanism to limit write access to descriptors specific registers (MGC, MRC and MTO registers). 00b - Global Lock disabled. Registers can be written based on individual register access attribute. 01b - NA 10b - Lock enabled. Only the global configuration lock owner can write to the registers. 11b - Lock enabled. All registers are read only until unlocked
9-6 —	Reserved
5-0 GCLCKMID	Global configuration Lock Owner Status This fields specifies the 6-bit Master-ID of Global configuration Lock owner (which set MGC[GCLCK]=10). Input value of Global Master-ID is provided by sideband signals.

80.14.2.54 Master Read Command (MRC)

Offset

Register	Offset
MRC	924h

Function

This register is access controlled. It can only be programmed by master with master ID equal to 000011b.

NOTE

In case of Sequence Auto Join instruction in LUT, SFP will parse only first sequence. Second sequence will not be parsed for checking Read commands.

80.14.2.60 Interrupt Enable (INT_EN)

Offset

Register	Offset
INT_EN	93Ch

Function

This register is access controlled and can only be programmed by privilege masters.

NOTE

In case Queue Specific Error Interrupt bits (TG0SFAR,TG1SFAR,TG0IPCR,TG1IPCR) are enabled, ensure that the core executing interrupt handler can clear the Queue specific TGxSFARS and TGxIPCRS registers only when core's security attribute matches the queue. In case there is a mismatch in security attribute, you must change the TGMDADx.SA attribute of that queue to match the core SA attribute. After that, core can clear the error and then revert the changes in TGMDADx.SA field.

80.14.3 Serial flash memory address assignment

The serial flash memory address assignment can be modified by writing into Serial Flash Memory A1 Top Address Register (SFA1AD) and Serial Flash Memory A2 Top Address Register (SFA2AD) for device A

Table 729. Serial flash memory address assignment

Parameter	Function	Access mode
QuadSPI_AMBA_BASE ((31:10) - 22 bits)	QuadSPI AHB base address First address of the serial flash memory device as presented to the QuadSPI controller. This might be the base of the serial flash memory in the system address map or it may be a remapping, for instance to 0h, performed by the system. (See the system address map file attached to this document)	
QuadSPI_ARDB_BASE	First address of the QuadSPI Rx buffer on system memory map	

Table continues on the next page...

Table 729. Serial flash memory address assignment (continued)

Parameter	Function	Access mode
TOP_ADDR_MEMA1(TPADA1)	Top address for the external flash memory A1 (the first of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA1 and QuadSPI_AMBA_BASE is routed to serial flash memory A1.
TOP_ADDR_MEMA2(TPADA2)	Top address for the external flash memory A2 (the second of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA2 and TOP_ADDR_MEMA1 is routed to serial flash memory A2.

80.15 Flash memory mapped AMBA bus

QuadSPI_AMBA_BASE defines the address to be used as the start address of the serial flash memory device, as defined by the system memory map. Note that this may be a remapping of the physical address of the serial flash memory in the system. See the system address map for details.

Table 730. QuadSPI AMBA bus memory map

Address	Register name
QuadSPI_AMBA_BASE to (TOP_ADDR_MEMA2 - 1h)	• See Memory-mapped serial flash memory data—individual flash memory mode on flash memory A. • For information about byte ordering, see Table 693 and Table 694.
QuadSPI_ARDB_BASE to... (32 * 4 Byte) QuadSPI_ARDB_BASE + 1FFh	• See AHB RX Data Buffer Register (ARDB0 - ARDB31). • For information about the byte ordering, see Table 693.

NOTE

Any read access to non-implemented addresses provides undefined results.

In individual flash memory modes, the 3/4 address bytes (as programmed in the instruction/operand in the sequence) available for the flash memory address are determined by SFADR[23:0] or SFADR[31:0] as provided in the table shown above.

80.15.1 AHB bus access read considerations

Note that all logic in the QuadSPI module implementing the AHB bus access is designed to read the content of an external serial flash memory device. Therefore, the following restrictions apply to the QuadSPI module with respect to accesses to the AHB bus:

- AHB bus read access types—NONSEQ and BUSY—are fully supported.
- AHB read access type—SEQ—is treated in the same way as NONSEQ. See Flash memory mapped AMBA bus for details.
- Early burst termination is not supported for AHB transactions.
- An AHB error response is provided on occurrence of:
  - Parity error
  - ECC error from flash memory
  - Data learning failure

  Also, interrupts (if enabled) are provided along with the AHB error response.

- An AHB error response occurs when FR[AITEF] bit is set
- An AHB bus stall along with error response occurs when FR[AAEF] bit is set

80.15.2 Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

Starting with address QuadSPI_AMBA_BASE, the content of the first external serial flash memory device is mapped into the address space of the device containing the QuadSPI module. Serial flash memory byte address 0h corresponds to bus address, QuadSPI_AMBA_BASE, in an increasing order. . See the following table for the address mapping. The byte ordering for 32-bit access is provided in Table 693 and for 64-bit read access, the byte ordering is provided in Table 694.

Table 731. Memory-mapped individual flash memory mode—flash memory A address scheme

Memory-mapped address 32-bit access	Memory-mapped address 64-bit access	Serial flash memory byte address	Flash memory device
QuadSPI_AMBA_BASE + 0h	QuadSPI_AMBA_BASE + 0h	0h to 3h	A1
QuadSPI_AMBA_BASE + 4h		4h to 7h	
...	...	...	
TOP_ADDR_MEMA1 - 8h	TOP_ADDR_MEMA1 - 8h	(TOP_ADDR_MEMA1- 8h) to (TOP_ADDR_MEMA1 - 0h4 -0h1)	
TOP_ADDR_MEMA1 - 4h		(TOP_ADDR_MEMA1 - 4h) to (TOP_ADDR_MEMA1 - 0h1)	
TOP_ADDR_MEMA1 + 4h	TOP_ADDR_MEMA1 + 0h	0h to 3h	A2
TOP_ADDR_MEMA1 + 0h4		4h to 7h	
...	...	...	
TOP_ADDR_MEMA2 - 8h	TOP_ADDR_MEMA2 - 8h	(TOP_ADDR_MEMA2 - 8h) to (TOP_ADDR_MEMA2 - 4h - 1h)	
TOP_ADDR_MEMA2 - 4h		(TOP_ADDR_MEMA2 - 4h) to (TOP_ADDR_MEMA2 - 1h)	

The available address range depends on the size of the external serial flash memory device. Any access beyond the size of the external serial flash memory provides undefined results.

For details concerning the read process, see Flash memory read.

80.15.3 ARDB register descriptions

NOTE

See the system memory map in this document for the base address of the QuadSPI AHB RX data buffer.

80.15.3.1 ARDB memory map

QuadSPI_ARDB base address: 6800_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h - 7Ch	AHB RX Data Buffer Register (ARDB0 - ARDB31)	32	R	0000_0000h

80.15.3.2 AHB RX Data Buffer Register (ARDB0 - ARDB31)

Offset

For a = 0 to 31:

Register	Offset
ARDBa	0h + (a × 4h)

Function

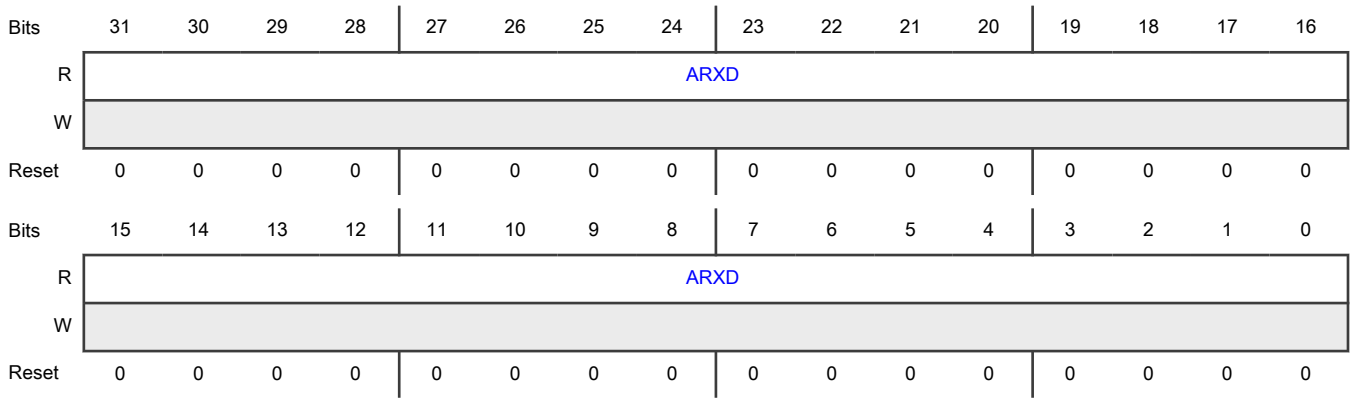
This register is used to read the buffer content of the RX buffer from successive addresses. ARDB0 corresponds to the RX buffer register entry corresponding to the current value of the read pointer in an increasing order.

The increment of the read pointer depends on the access scheme (DMA or flag-driven). See Flash memory read, RX buffer, data read through register interface, and AHB read for the description of successive accesses to the RX buffer content. See Byte Ordering of Serial Flash Memory Read Data for the byte ordering scheme.

Valid address range accessible in the ARDB*n* range depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

- Example 1 - RX buffer filled completely with 32 words: In this case, the address range for valid read access extends from ARDB0 to ARDB31 .
- Example 2 - RX buffer filled with five valid words; RX buffer fill level RBSR[RDBFL] is 5. In this case, an access to ARDB4 provides the last valid entry.

Diagram



Fields

Field	Function

Chapter 81
Zipwire

81.1 Chip-specific Zipwire information

81.1.1 Zipwire instances and configuration

This section summarizes the module configuration in the controller. For a comprehensive description of SIPI and LFAST, please refer the specific dedicated chapters for SIPI and LFAST.

The SIPI and LFAST are connected to one another and appear as a single unit. The LFAST portion of the two modules allows for high speed inter-device communications. The SIPI allows memory to be shared between devices which have SIPI and LFAST communication modules (see Figure 618). Zipwire is official brand for the combination of LFAST and SIPI.

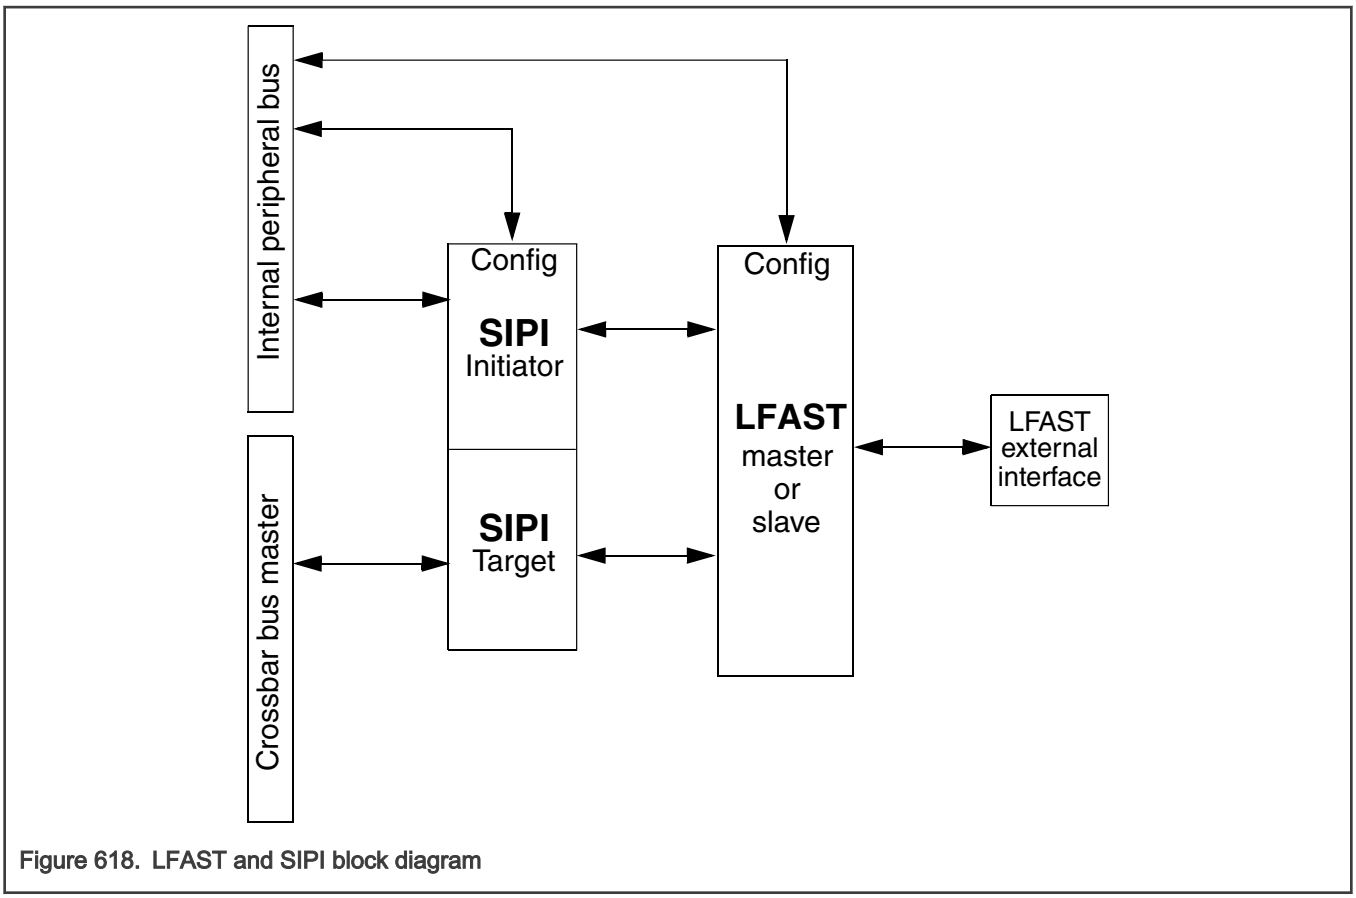

Figure 618. LFAST and SIPI block diagram

SIPI chip ID value:

Each SIPI instance has a 32-bit-wide chip ID. The chip ID value indicates the Zipwire instance.

Table 732. SIPI chip ID value

SIPI instance	Bits 31–0
SIPI_0	098D801D

DCM.DCMRWF1 and DCM.DCMRWF3 registers need to be configured. See the "Device Configuration Module General-Purpose Registers (DCM_GPR)" chapter for details.

81.2 Overview

The Serial Inter Processor Interface (SIPI) and LVDS Fast Asynchronous Serial Transmission Interface (LFAST) modules work together as a single unit called Zipwire. The LFAST portion of the two modules allows for high-speed, inter-device communications. The SIPI module allows memory to be shared between devices having SIPI and LFAST communication modules.

The LFAST module can operate in either slave or master mode configurations. The node running in the master mode controls the serial link, but SIPI, in both the master and slave modes, can act as an initiator and a target for SIPI commands simultaneously. Please see the SIPI and LFAST chapters for detailed information on module configuration and functionality.

81.3 Introduction

Zipwire is a group of modules that allow one MCU to have a fast, low pin count, serial communication link directly into the memory mapped peripherals and/or memories of another MCU or smart ASIC. Zipwire is implemented in hardware, so there is no CPU load for the initiator or target node. Zipwire supports 8-bit, 16-bit, or 32-bit reads and writes to any 32-bit address at the target node.

Zipwire architecture is fully pipelined and support multiple outstanding commands to allow maximum use of the serial link bandwidth.

The serial link runs at a high speed using the LVDS physical layer. One LVDS pair for Tx and another pair for Rx, with a separate LFAST reference clock for a total of five pins.

Zipwire also supports a streaming mode for the transfer of large blocks of data.

In the streaming mode, Zipwire has a high transfer rate.

81.4 Zipwire block diagram

The next diagram shows two MCUs with Zipwire connected using a five wire interface. Both MCUs support Target and Initiator modes of Zipwire. The SIPI Bus Master Interface is used for all Target mode transactions. The SIPI Register Interface is used for all Initiator Transactions and initial setup. The LFAST Register Interface is used for Initial Setup.

The following diagram shows the LFAST reference clock is coming from MCU B clock system. The Ref_Clock can come from either MCU. It is user configurable, but it must be the same clock that drives both LFAST modules.

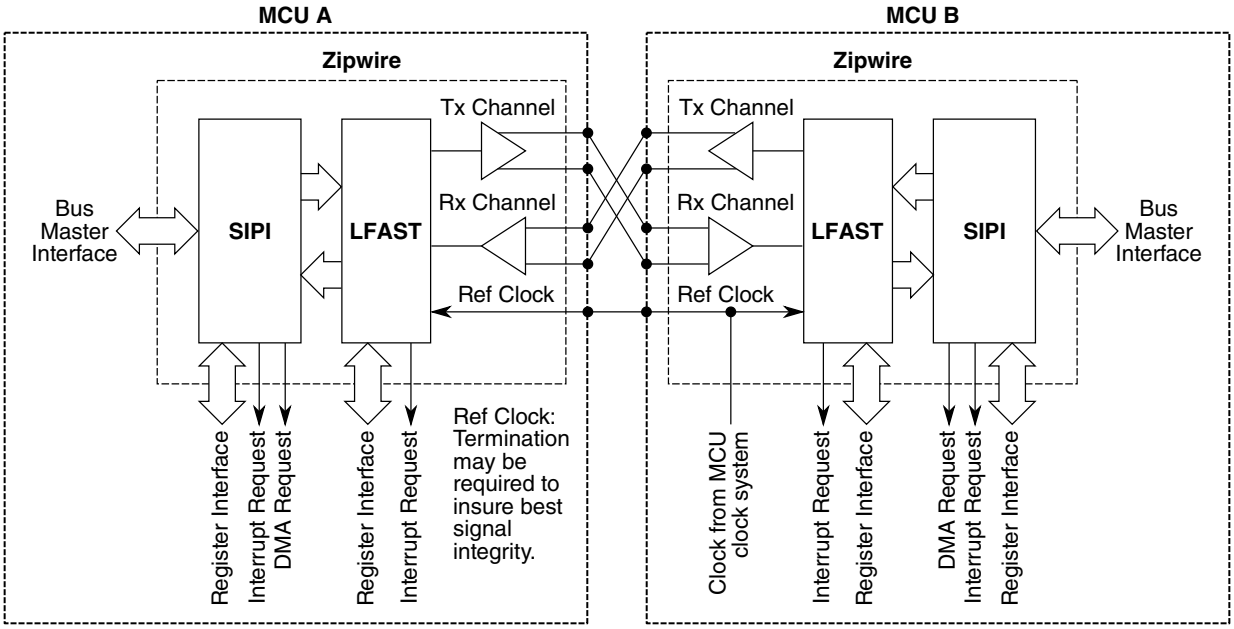

Figure 619. Zipwire connection diagram

81.5 Architecture

Zipwire consists of several modules and system resources. The physical layer is LVDS with common mode voltage and defined swing.

The transport layer is a protocol called LFAST, which is an asynchronous protocol, using non-return to zero encoding. The LFAST protocol consists of the following:

- A fixed 16-bit sync frame to allow the receiver to detect the optimal point to sample the incoming data
- An 8-bit LFAST header, which defines the channel number and the size of the LFAST payload
- The payload, which can be between 8 and 288 bits

The application layer protocol is called SIPI. SIPI runs on top of LFAST and is fully encapsulated within the LFAST payload. SIPI uses four fixed sizes of LFAST payload in Zipwire:

- 32-bit
- 64-bit
- 96-bit
- 288-bit

The SIPI protocol implements a suite of commands initiated by one MCU, for reading and writing any 32-bit address location in another connected MCU. The SIPI protocol allows either or both MCUs to initiate commands. The protocol also supports interrupt requests from one MCU to the other.

The SIPI module implements both the initiator part of the protocol and the recipient part of the protocol. The module implements four SIPI Initiator channels that can run independently of each other and can run simultaneously. The SIPI module is a bus master on the low speed XBAR. As the target MCU for a command from the initiating MCU, SIPI can perform read and write accesses to any address location within the target MCU. The software running on the local MCU, should configure the system MPU to allow/deny memory accesses to MCU memory and resources as required.

The initiator part of the module is connected to the DMA controller and is able to generate DMA requests as a command is completed. This allows a series of read or write commands to be queued in the Initiator MCU and executed by DMA and SIPI without CPU intervention at either Initiator or Target MCU.

81.6 Zipwire interconnections

LFAST includes the following connections:

- Tx and Rx configuration is controlled by LFAST Control registers
- Peripheral Bridge interface (PBRIDGE) — Allows software to read and write configuration registers
- Tx Data Port/Rx Data Port — Directly connected to the SIPI module and allows received data to be efficiently transferred to SIPI and transmit data to be transferred from SIPI
- Interrupt Request connections — Allows the module to flag to the CPU when it requires servicing

SIPI includes the following connections:

- Peripheral Bridge interface (PBRIDGE) — Allows the software to read and write configuration registers and SIPI Interface Registers.
- DMA connections — Allows SIPI command sequences to be queues and initiated without CPU intervention
- Crossbar master port — Allows SIPI to execute requested commands to read and write MCU address space
- Tx Data Port/Rx Data Port — Directly connected to the LFAST module and allows received data to be efficiently transferred from LFAST and transmit data to be transferred to LFAST
- Interrupt Request connections — Allows the module to flag to the CPU when it requires servicing

81.7 Zipwire performance

Two aspects of performance are considered:

- Bandwidth — The rate at which data can be read or written between two nodes. It assumes that read or write commands from the Initiator node can be sent continuously at the highest speed at which the Target node can consume those commands.
- Latency — The time from the Initiator node sending a read or write command to the Initiator node receiving the read data or write acknowledge.

81.7.1 Read performance

A Zipwire read operation consists of three stages:

- Initiator sends SIPI Read command to Target.
- Target parses the received command and runs a master bus cycle to read the data.
- Target sends the SIPI Read response back to the Initiator.

A SIPI Read command consists of:

- 16-bit header
- 32-bit read address
- 16-bit CRC
- 64 bits total

A SIPI Read response consists of:

- 16-bit header
- 32-bit read data
- 16-bit CRC

- 64 bits total

The SIPI message is encapsulated in an LFAST frame where the LFAST payload is the size of the SIPI message.

The LFAST frame consists of:

- 16-bit synchronisation header
- 8-bit header
- 64-bit payload
- 1-bit stop bit
- 89 bits total

LFAST Baud rate is *c* Mbaud that yields a bit time of *d* ns

Therefore, an 89-bit LFAST transmission of a SIPI 64-bit Read command or 64-bit Read response takes 89*d* ns.

The SIPI module takes thirteen system clock cycles to parse a command and create a Read response, in addition to the time to run the master bus cycle. The time to run the master bus cycle varies depending on the memory being read.

Assumptions:

- Average of *n* × XBAR cycles to read different memories
- XBAR clocked at *x* MHz
- SIPI clocked at *y* MHz

Therefore, time for SIPI to read an address location is:

(13 × *y* MHz clocks) + (*n* × *x* MHz clocks) = *z* ns

81.7.1.1 Read bandwidth

The Zipwire target node has a three-message deep receive FIFO and a three-message deep transmit FIFO. So, the Target node can simultaneously receive a command, process a command, and send the Read response.

The time to transmit a command or response is less than the time to process the command. Therefore, the bandwidth is limited by the time to process the message.

Read Bandwidth = 4 bytes in *z* ns = 4 × *z* MB/second

81.7.1.2 Read latency

The latency is the time taken to send a Read command, process the command, and send a Read response.

Read Latency = 89*d* ns + *z* ns + 89*d* ns = *z* + 178*d* ns

81.7.2 Write performance

A Zipwire write operation consists of three stages:

- Initiator sends a SIPI Write command to Target.
- Target parses the received command and runs a master bus cycle to write the data.
- Target sends the SIPI Write response back to the Initiator.

A SIPI Write command consists of:

- 16-bit header
- 32-bit write address
- 32-bit write data
- 16-bit CRC

- 96 bits total

A SIPI Write acknowledge consists of:

- 16-bit header
- 16-bit CRC
- 32 bits total

The SIPI message is encapsulated in an LFAST frame where the LFAST payload is the size of the SIPI message.

The LFAST frame consists of:

- 16-bit synchronisation header
- 8-bit header
- 96-bit payload (command) or 32-bit (acknowledge)
- 1-bit stop bit
- 121 bits total (command) or 57 bits (acknowledge)

LFAST Baud rate is *c* Mbaud that yields a bit time of *d* ns

Therefore, the time for an LFAST transmission is:

- 121-bit LFAST transmission of a SIPI 96-bit Write Command takes 121*d* ns
- 57-bit LFAST transmission of a SIPI 32-bit Write Acknowledge takes 57*d* ns

The SIPI module takes thirteen system clock cycles to parse a command and create a Write response, in addition to the time to run the master bus cycle. This time varies depending on the memory being written.

Assumptions:

- Average of *m* × slow XBAR cycles to write different memories
- Slow XBAR clocked at *x* MHz
- SIPI clocked at *y* MHz

Therefore, the time for SIPI to write an address location is:

(13 × *y* MHz clocks) + (*m* × *x* MHz clocks) = *v* ns

81.7.2.1 Write bandwidth

The Zipwire target node has a three-message deep receive FIFO and a three-message deep transmit FIFO. So, the Target node can simultaneously receive a command, process a command, and send the Write Acknowledge response.

The time to transmit the command is longer than the time to process the command, or the time to transmit the Write Acknowledge. Therefore, the bandwidth is limited by the time to transmit the command.

Write Bandwidth = 4 bytes in *v* ns = 4 × *v* MB/second

81.7.2.2 Write latency

The latency is the time taken to send a Write command, process the command, and send a Write Acknowledge.

Write Latency = 121*d* ns + *v* ns + 57*d* ns = *v* + 178*d* ns

Chapter 82
Serial Interprocessor Interface (SIPI)

82.1 Chip-specific SIPI information

82.1.1 SIPI instances and configuration

S32K396 supports one instance of SIPI.

Table 733. SIPI instances

Configuration	S32K396
Number of supported channels	4
Number of outstanding frames allowed	4

82.2 Overview

SIPI is an application-layer protocol that runs on top of the LVDS Fast Asynchronous Serial Transmission (LFAST) module. The local device uses it to access the shared memory of a remote device.

SIPI defines point-to-point, full-duplex communication between two devices, where LFAST works as a physical medium of communication between both the devices.

An instance of SIPI can act as an initiator, or target, or both. SIPI can access the shared memory directly through its AHB master interface or through its DMA interface. The AHB master interface is used when the node acts as target and the DMA interface is used when the node acts as an initiator. SIPI includes four channels, with channel 2 having data streaming capability. Payload width for channel 0, 1, and 3 is 32 bits, and for channel 2, data widths can be 32 bits, or 256 bits when streaming. You can use any of these channels for DMA access or bus interface access, depending on the setting of the SIPI_CCR*n*. The Cyclic Redundancy Check (CRC) encoder calculates CRC on the command frame. Then, the SIPI initiator appends the CRC to the end of the frame before transmission.

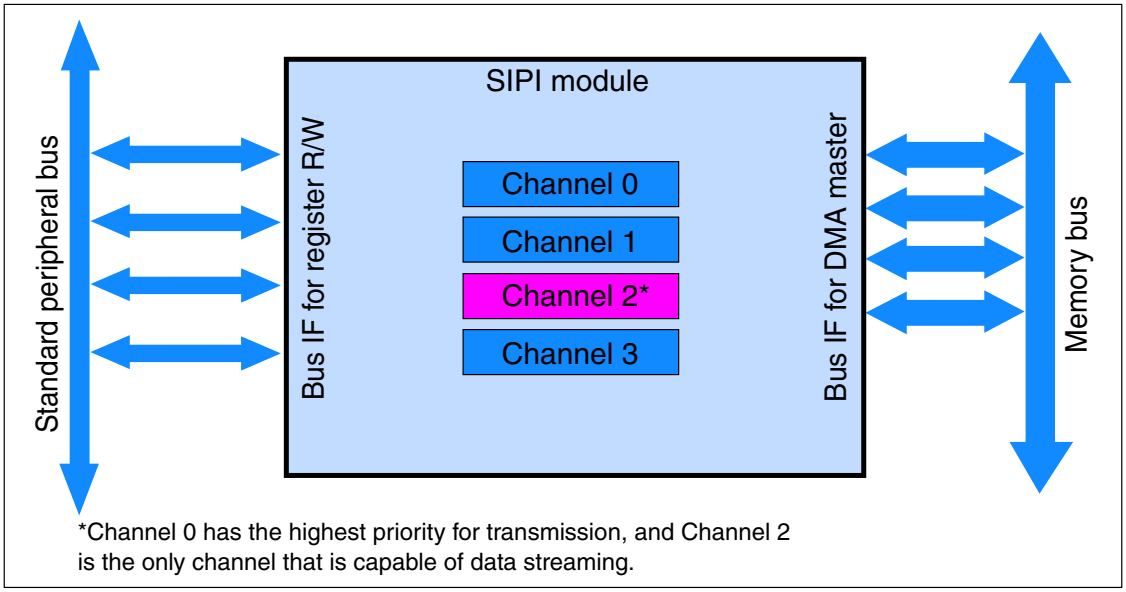

Figure 621. SIPI module

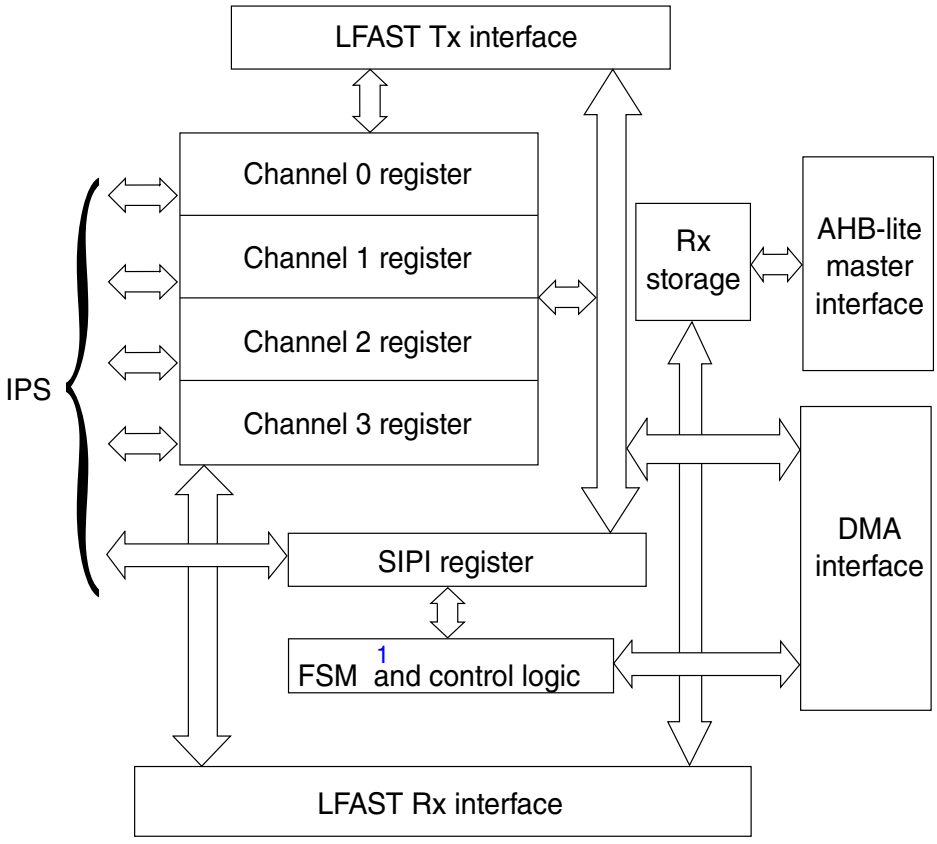
82.3 SIPI block diagram



1 Finite State Machine

Figure 622. SIPI block diagram

82.4 Feature description

This section describes the features of the SIPI module.

82.4.1 Main features

- Point-to-point communication between two devices
- Full-duplex communication
- Four channels, including one channel with data streaming capability
- Configurable DMA access for each channel
- CRC protection mechanism
- Timeout protection mechanism
- Fixed-priority channel selection
- Data size up to 256 bits on streaming channel
- Common tag pool for assigning sequential transfer IDs to every new transfer
- AHB master interface that is used by the target node to access shared memory
- Target node containing a set of nine 32-bit internal registers to store commands

- Support for up to 4 outstanding requests at initiator

82.4.2 Standard features

- IPS bus interface (PBRIDGE)
- SPP DMA2x bus interface
- AHB master interface
- LFAST Tx/Rx interfaces
- CRC error detection (CRC16)

82.5 SIPI operation from reset

When the SIPI module exits reset, it becomes operational, and the Target mode is enabled without the need to configure the control registers.

82.6 Functional description

82.6.1 External signals

The SIPI module does not include any chip external signals.

82.6.2 Frame format

All frames have the same general format:

- 16-bit header
- Address, address and data, or nothing
- 16-bit CRC

There are two main groups of command: read and write. Within the two groups are these read/write formats:

- 32-bit
- 16-bit
- 8-bit
- 256-bit

Each command generates one of these three different responses:

- Read data
- Write acknowledge
- Error

There is an additional command that requests the module ID from the Target node. The sections below illustrate the four different frame formats that are used to implement all the commands and responses.

The number of frames depends on the data buffers (associated with every channel); the frame data is stored in data buffers at the initiator. The address and data are both transmitted in the same order in which they are stored.

82.6.2.1 Register read request

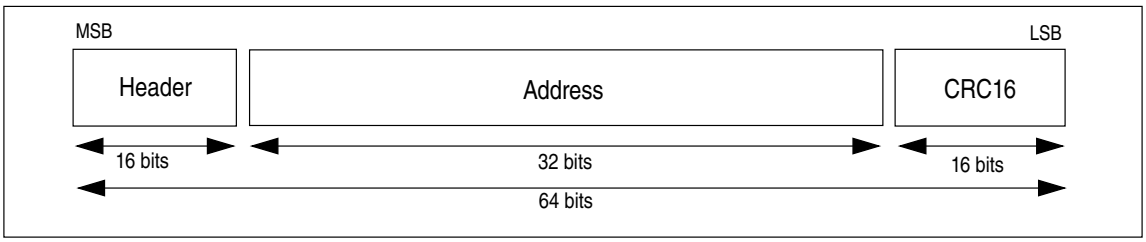


Figure 623. SIPI register read request

82.6.2.2 Register read response, ID request response

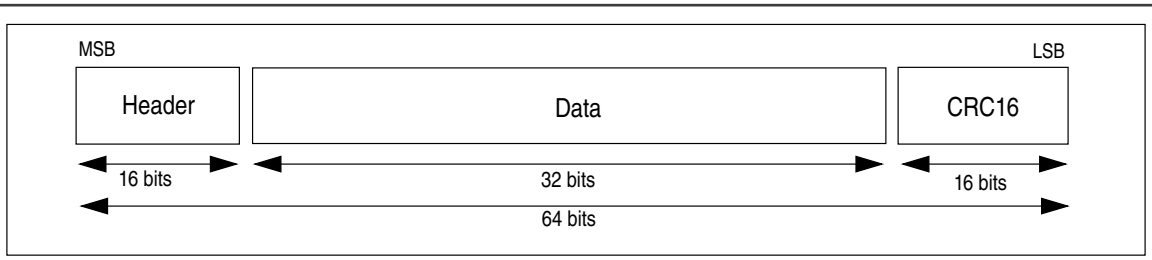

Figure 624. SIPI read response

82.6.2.3 Register write request

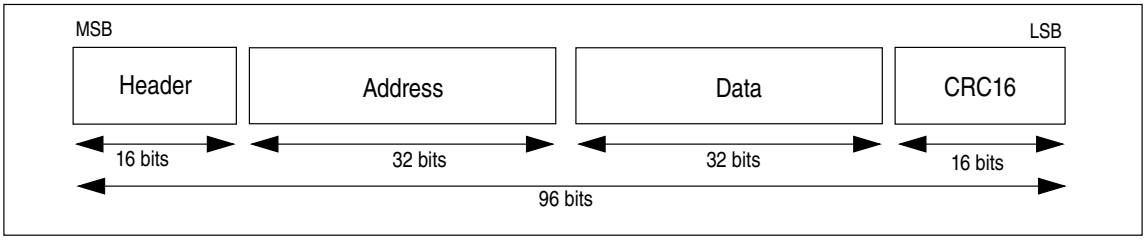

Figure 625. SIPI register write request

82.6.2.4 Trigger transfer, ID transfer, write acknowledge, and streaming write acknowledge

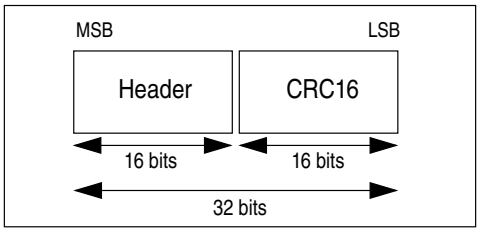

Figure 626. SIPI write acknowledge

82.6.2.5 Streaming write request

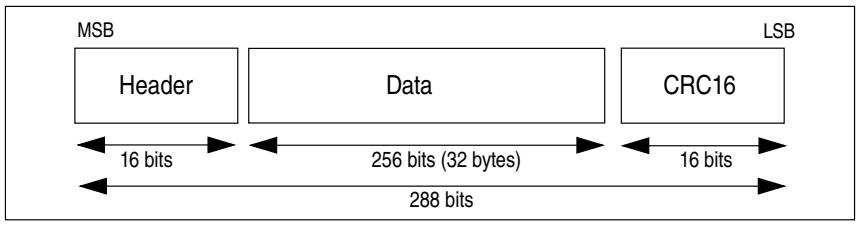

Figure 627. Streaming write request format

NOTE

SIPI uses direct write operations to set the streaming address, and performs streaming data write using the format shown in the figure above.

82.6.2.6 Header field

The Header field contains 16 bits of configuration information, and MSB is transmitted first.

82.6.2.6.1 SIPI header coding

See Figure 628, Table 734, Figure 629, and Table 735 that show how the SIPI header bits are coded.

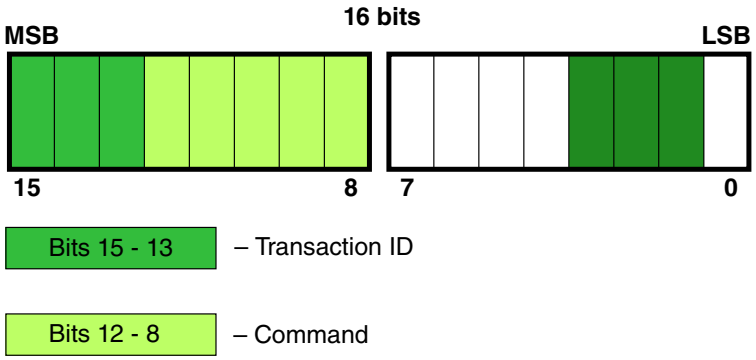

Figure 628. SIPI header coding

The following table shows the command coding for the bits[12:8] of the header.

Table 734. SIPI header command coding

b[12:8] (hex)	Command	Payload size
00	Read 8 bits	64
01	Read 16 bits	64
02	Read 32 Bits	64
03	Reserved	-
04	Write 8 bits with ACK	96

Table continues on the next page...

Table 734. SIPI header command coding (continued)

b[12:8] (hex)	Command	Payload size
05	Write 16 bits with ACK	96
06	Write 32 bits with ACK	96
07	Reserved	-
08	ACK - OK	32
09	ACK - Fault	32
0A	Read Answer - OK	64
0B	Reserved	-
0C	Trigger command with ACK	32
0D	Reserved	-
...	...	...
11	Reserved	-
12	ID Register Read Request	32
13	Reserved	-
...	...	...
16	Reserved	-
17	Stream Data with ACK (32 bytes)	288
18	Reserved	-
...	...	...
1F	Reserved	-

See Figure 629 that shows the Channel Number field in the header, and see Table 735 that shows the channel number coding.

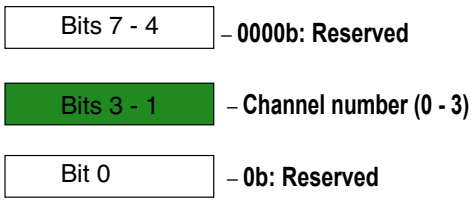

Figure 629. SIPI header channel field

Table 735. SIPI header channel number coding

SIPI channel name	Channel number coding in header(s)		Comment
	SIPI channel coding select field (MCR[CHNSB])		
	Code table I (MCR[CHNSB]=1)	Code table II (MCR[CHNSB]=0)	
0 (Channel A)	000b	100b	In use
1 (Channel B)	001b	101b	In use
2 (Channel C)	010b	110b	In use
3 (Channel D)	011b	111b	In use
4 (Channel E)	100b	000b	Reserved
5 (Channel F)	101b	001b	Reserved
6 (Channel G)	110b	010b	Reserved
7 (Channel H)	111b	011b	Reserved

82.6.2.7 Address field

The Address field is 32-bit wide with the MSB transmitted first.

82.6.2.8 Payload field

See the following table that shows the payload sizes of the LFAST frames.

Table 736. Payload sizes of the LFAST channel frames

LFAST code	SIPI code	LFAST payload size (bits)	LFAST payload size (bytes)
000b	-	8	1
001b	-	32	4
010b	010b	64	8
011b	011b	96	12
100b	100b	128	16
101b	101b	256	32
110b	110b	512	64
111b	111b	288	36

See the following table that shows the converted coding of LFAST for a given SIPI code.

Table 737. Converted coding of the LFAST channel code for SIPI headers

LFAST code	SIPI code	Channel (hex)[1]
0100b	100b	A
0101b	101b	B
0110b	110b	C
0111b	111b	D
1000b	000b	E (not used by SIPI)
1001b	001b	F (not used by SIPI)
1010b	010b	G (not used by SIPI)
1011b	011b	H (not used by SIPI)

1.
- SIPI channel 0 sends all commands to LFAST channel A. The commands are processed and the response is sent to LFAST channel A.
- SIPI channel 1 sends all commands to LFAST channel B. These commands are processed and the response is sent to LFAST channel B.
- SIPI channel 2 sends all commands to LFAST channel C. These commands are processed and the response is sent to LFAST channel C.
- SIPI channel 3 sends all commands to LFAST channel D. These commands are processed and the response is sent to LFAST channel D.

82.6.2.9 CRC field

The CRC field is 16-bit wide with calculation always enabled using the CRC-16-CCITT syndrome (x16 + x12 + x5 + 1). MSB is sent first in the data stream.

82.6.2.9.1 CRC field examples

82.6.2.9.1.1 Example 1-32 bit write on channel 1 with ID1

- Header = 260Ah
- Address = 1122_3344h
- Data = CCDD_EEFFh
- CRC = BF7Dh

82.6.2.9.1.2 Example 2-32 bit read on channel 2 with ID2

- Header = 420Ch
- Address = 89AB_CDEFh
- CRC = 6B80h

82.6.2.9.1.3 Example 3-event command on channel 3 with ID3

- Header = 6C0Eh
- CRC = B286h

82.6.2.10 Clocking

This module has no clocking considerations.

82.7.2 SIPI Channel Control Register 0 (CCR0)

Offset

Register	Offset
CCR0	0h

Function

NOTE

Back to back transactions are not supported on a single channel (for example, if the channel busy bit, SIPI_CSR0[CB] = 1, is configured for a channel, it cannot be triggered for another transfer until the data buffers are empty and the channel is free, SIPI_CSR0[CB] = 0).

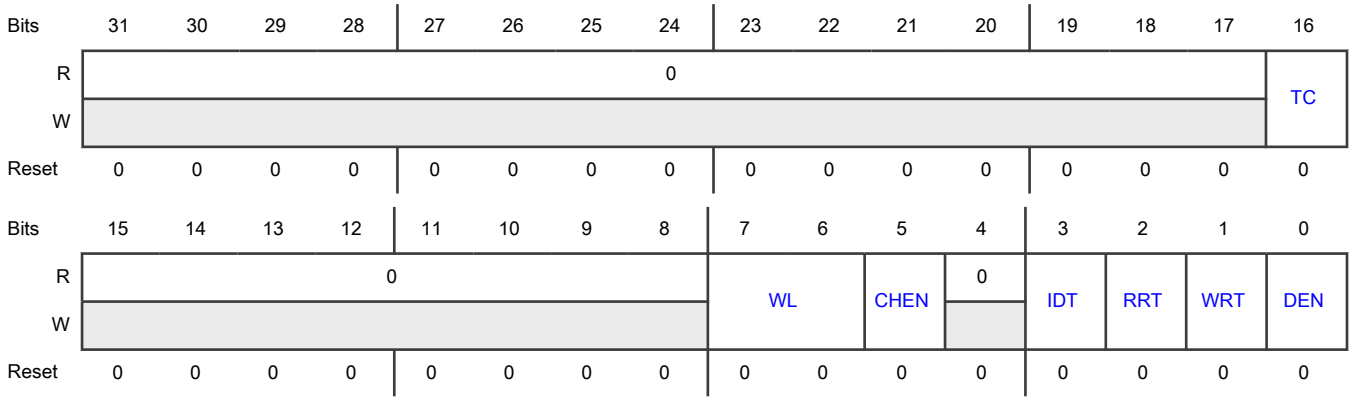
PRIORITY SCHEDULING: The channel whose SIPI_CAR*n* is written first will gain access first irrespective of its priority at the start of the transfer. As more transfers are requested, priority will be resolved as per the priority scheme (for example, channel 0-channel 1-channel 2-channel 3). Scheduling will occur each time the LFAST is not ready to receive data and no channel is pending for data transmission. The reason for the scheduling is that a common CRC module is shared by all channels. If the LFAST is ready to receive data during the entire process, it will happen only in the beginning and later on priority will be resolved as per the priority scheme.

NOTE

The CHEN bit of this register is writable in Initialization mode (SIPI_MCR[INIT] = 1). Also, the command bits can be written only when the corresponding Channel busy bit is not asserted (SIPI_CSR*n*[CB] = 1 (see SIPI Channel Status Register 0 (CSR0)). Software will need to poll the respective channel busy bits before attempting to change the command type.

Only one channel at a time can transmit. Therefore, only one channel can remain busy. Maximum time allowed to transmit a full command is nine clock cycles. The Command type of a channel can only be changed when it is no longer busy. Also, to send a command, we need to write to the corresponding SIPI_CAR*n* (see SIPI Channel Address Register 0 (CAR0)).

Diagram



Fields

Field	Function
31-17 —	Reserved
16 TC	Send Trigger Command. A Trigger Command requires that only this bit to be set by software, the trigger does not depend on settings in SIPI_CAR0. 0b - Trigger command not sent 1b - Trigger command sent
15-8 —	Reserved
7-6 WL	Word Length Transfer. For Streaming write, WL bits should be written 10. 00b - 8-bit 01b - 16-bit 10b - 32-bit 11b - not used
5 CHEN	Channel Enable. If all channel enables are simultaneously written to enable the channels, channel 0 will be given the highest priority for transmission. For channels, the lowest channel number is given highest priority. 0b - Channel is disabled 1b - Channel is enabled
4 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
3 IDT	ID Read Request Transfer. This request returns the value of the CHIP ID. **NOTE** LEGACY_MODE_BIT must be set to '1' for chip ID read request. 0b - ID read request not sent 1b - ID read request sent
2 RRT	Read Request Transfer. 0b - Read request will not be sent 1b - Read request transfer by the initiator. This bit can not be written if SIPI_CCR0[IDT] = 1.
1 WRT	Write Request Transfer. **NOTE** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0b - No write request will be sent 1b - Write request transfer by the initiator. This bit can not be written if SIPI_CCR0[IDT] = 1 or SIPI_CCR0[RRT] = 1.
0 DEN	DMA Enable. 0b - Reserved 1b - Channel will be used for DMA access

82.7.3 SIPI Channel Status Register 0 (CSR0)

Offset

Register	Offset
CSR0	4h

Function

CSR0 contains the status bits for the current transfer.

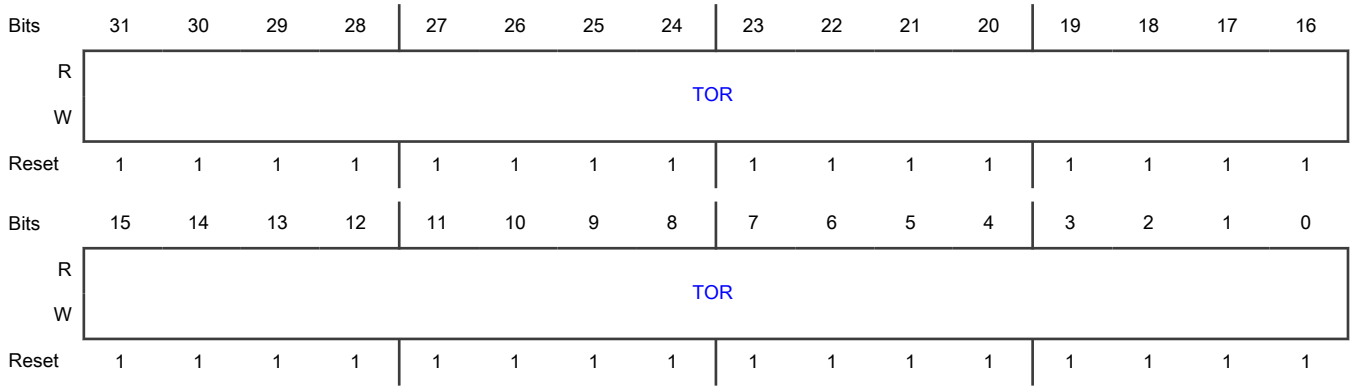
82.7.5 SIPI Channel Timeout Register 0 (CTOR0)

Offset

Register	Offset
CTOR0	10h

Function
SIPI_CTOR0 contains the timeout value for Tx requests.

Diagram



Fields

Field	Function
31-0 TOR	Timeout value for transmitted requests. Timeout counter runs on the prescaled peripheral clock. Prescaler is defined by SIPI_MCR[PRSCLR]. **NOTE** • Field can only be written during Initialization mode (SIPI_MCR[INIT] = 1). • Only 32-bit write access is allowed. • Write to any CTORx[TOR] register, updates all the CTORx registers with same value.

82.7.6 SIPI Channel CRC Register 0 (CCRC0)

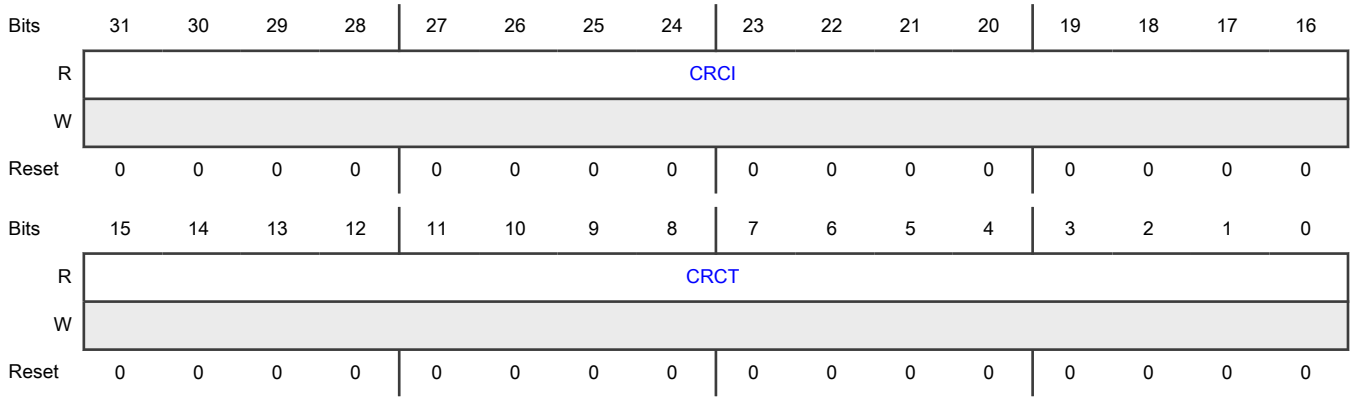
Offset

Register	Offset
CCRC0	14h

Function

SIPI_CCRC*n* is a read only which returns the CRC calculated value on the header, address and data bits.

Diagram



Fields

Field	Function
31-16 CRCI	CRCI Reflects received CRC value at initiator
15-0 CRCT	CRCT Reflects received CRC value at target

82.7.7 SIPI Channel Address Register 0 (CAR0)

Offset

Register	Offset
CAR0	18h

Function

SIPI_CAR0 is the address target for data transmission.

NOTE

The memory address must be 32bit word aligned. Unaligned memory access is not supported.

Diagram

82.7.11 SIPI Channel Interrupt Register 1 (CIR1)

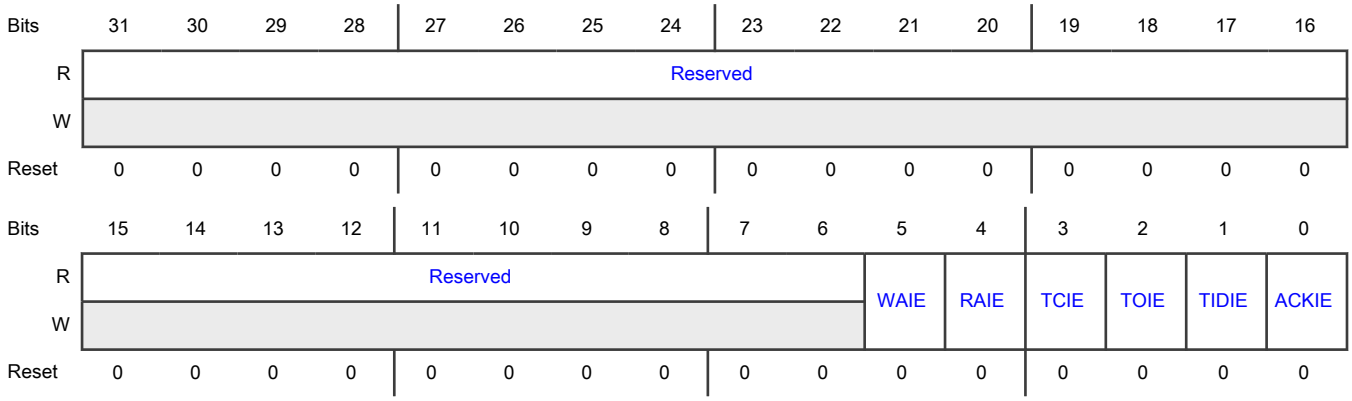
Offset

Register	Offset
CIR1	2Ch

Function

The CIR1 contains the interrupt enable bits for channel 1.

Diagram



Fields

Field	Function
31-6 —	Reserved
5 WAIE	WAIE Write Acknowledge Interrupt Enable. 0b - Interrupt is disabled 1b - Interrupt is enabled
4 RAIE	RAIE Read Answer Interrupt Enable. 0b - Interrupt is disabled 1b - Interrupt is enabled
3 TCIE	TCIE Trigger Command Interrupt Enable. 0b - Interrupt is disabled 1b - Interrupt is enabled
2 TOIE	TOIE Timeout Error Interrupt Enabled. 0b - Interrupt is disabled 1b - Interrupt is enabled
1 TIDIE	TIDIE Transaction ID Error Interrupt Enable. 0b - Interrupt is disabled 1b - Interrupt is enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
0 ACKIE	ACKIE Acknowledge Error Interrupt Enable. 0b - Interrupt is disabled 1b - Interrupt is enabled

82.7.12 SIPI Channel Timeout Register 1 (CTOR1)

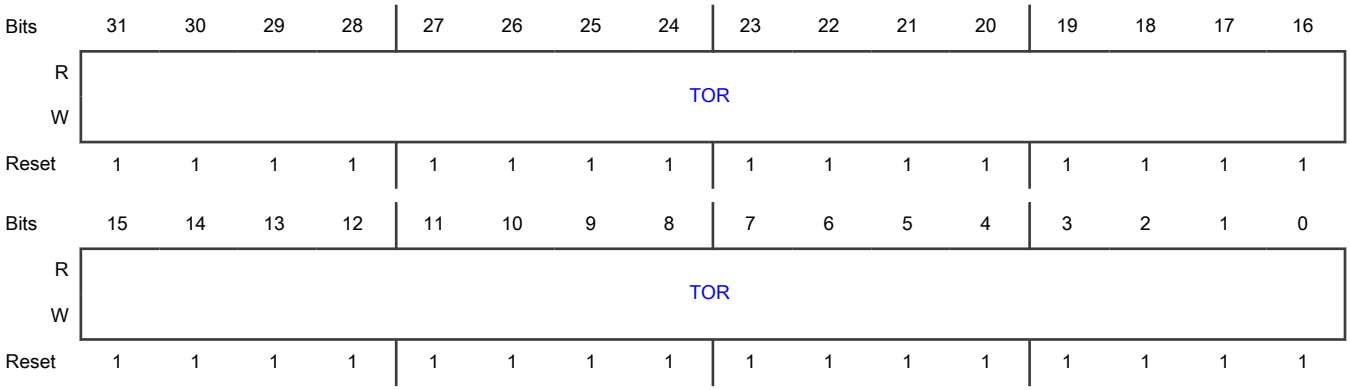
Offset

Register	Offset
CTOR1	30h

Function

SIPI_CTOR1 contains the timeout value for Tx requests.

Diagram



Fields

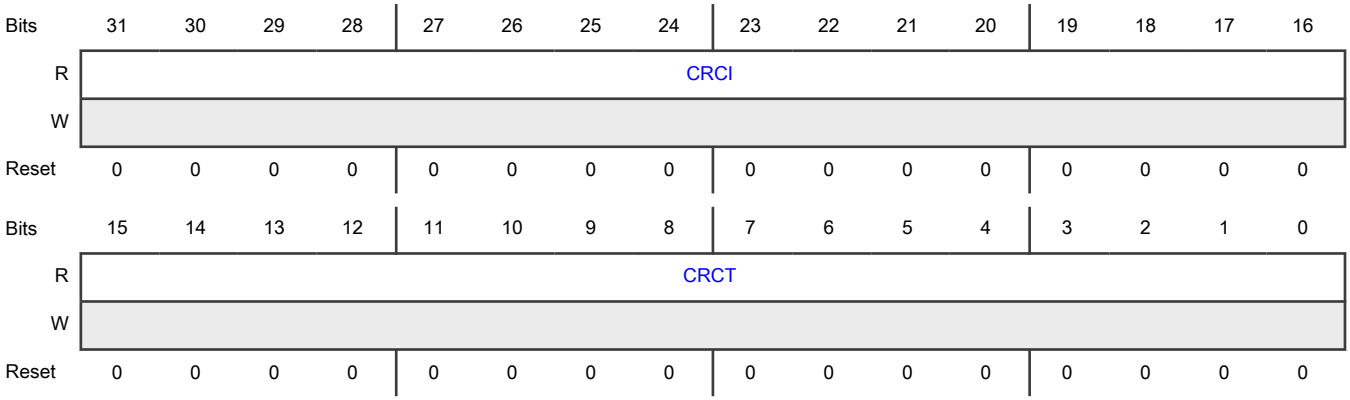
Field	Function
31-0 TOR	Timeout value for transmitted requests. Timeout counter runs on the prescaled peripheral clock. Prescaler is defined by SIPI_MCR[PRSCLR]. **NOTE** • Field can only be written during Initialization mode (SIPI_MCR[INIT] = 1). • Only 32-bit write access is allowed. • All CTORx[TOR], gets updated with same value

82.7.13 SIPI Channel CRC Register 1 (CCRC1)

Offset

Register	Offset
CCRC1	34h

Diagram



Fields

Field	Function
31-16 CRCI	CRCI Reflects received CRC value at initiator
15-0 CRCT	CRCT Reflects received CRC value at target

82.7.14 SIPI Channel Address Register 1 (CAR1)

Offset

Register	Offset
CAR1	38h

Function

SIPI_CAR1 is the address target for data transmission.

NOTE

The memory address must be 32bit word aligned. Unaligned memory access is not supported.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31-0 CDR	CDR Data register bits. Contains the data that will be transmitted, or received.

82.7.16 SIPI Channel Control Register 2 (CCR2)

Offset

Register	Offset
CCR2	40h

Function

NOTE

Back to back transactions are not supported on a single channel (for example, if the channel busy bit, SIPI_CSR2[CB] = 1, is configured for a channel, it cannot be triggered for another transfer until the data buffers are empty and the channel is free, SIPI_CSR2[CB] = 0).

NOTE

(see SIPI Channel Status Register 2 (CSR2)).

(see SIPI Channel Address Register 2 (CAR2)).

15-0 CRCT	CRCT Reflects received CRC value at target

82.7.28 SIPI Channel Address Register 3 (CAR3)

Offset

Register	Offset
CAR3	94h

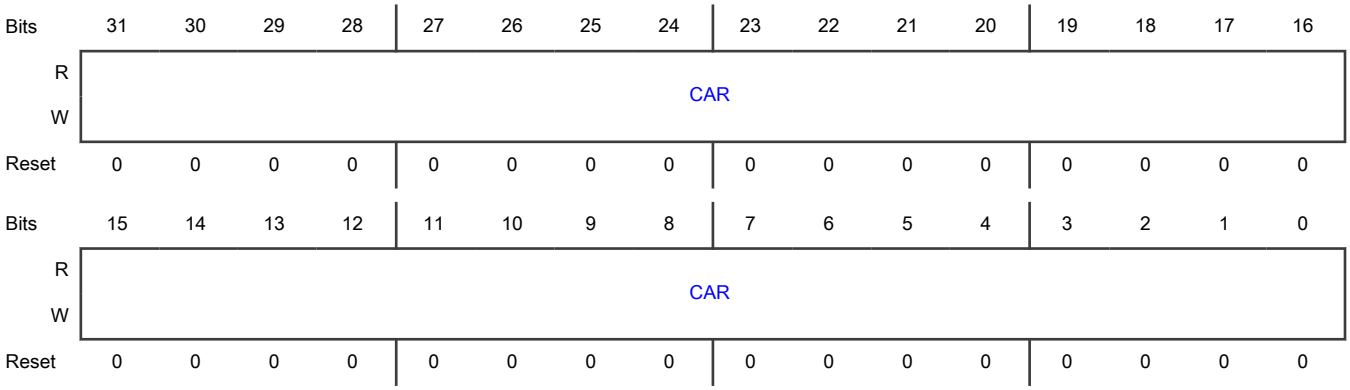
Function

SIPI_CAR3 is the address target for data transmission.

NOTE

The memory address must be 32bit word aligned. Unaligned memory access is not supported.

Diagram



Fields

Field	Function
31-0 CAR	CAR These bits contain the address of the target node.

82.7.29 SIPI Channel Data Register 3 (CDR3)

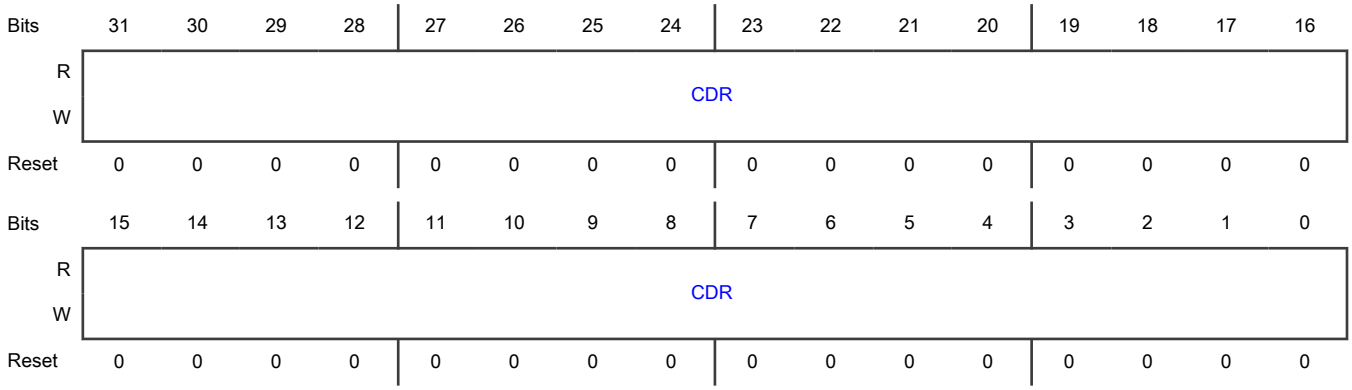
Offset

Register	Offset
CDR3	98h

Function

SIPI_CDR3

Diagram



Fields

Field	Function
31-0 CDR	CDR Data register bits. Contains the data that will be transmitted, or received.

82.7.30 SIPI Module Configuration Register (MCR)

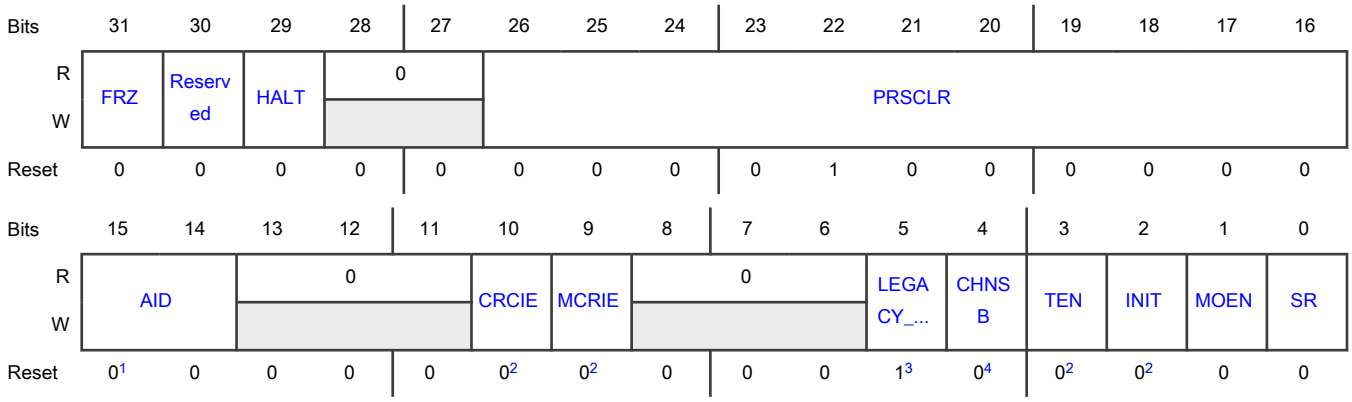
Offset

Register	Offset
MCR	9Ch

Function

The SIPI_MCR is a global 32-bit configuration register.

Diagram



1. Can be written in initialization mode only (SIPI_MCR[INIT] = 1).
2. Can only be written when SIPI_MCR[MOEN] = 1.
3. Can be written only once after reset in init mode.
4. Can be written only once after reset.

Fields

Field	Function
31 FRZ	Freeze Enable The FRZ bit specifies the SIPI behavior when Debug mode is requested at the MCU level. When FRZ is asserted, the SIPI is enabled to enter Freeze mode. Negation of this bit field causes SIPI to exit Freeze mode. **NOTE** Can only be written when SIPI_MCR[MOEN] = 1. 0b - Not enabled to enter Freeze mode 1b - Enabled to enter Freeze mode
30 —	Reserved **IMPORTANT** Always write the default value to this field.
29 HALT	Halt Mode Enable Assertion of this bit puts SIPI into Freeze mode. No Rx or Tx is performed in the SIPI until this bit is cleared. If this bit is enabled in during Tx or Rx communications, the current activity will finish, then the SIPI will enter Freeze mode. **NOTE** Can only be written when SIPI_MCR[MOEN] = 1. 0b - No Freeze mode request 1b - Enters Freeze mode if FRZ bit is asserted.
28-27 —	Reserved
26-16 PRSCLR	Timeout counter prescaler The timeout counter runs on the prescaled system clock. Default value is 64 (040h). The allowed programmable values are (all other values are ignored): 01000000b - 64(default) 10000000b - 128 000100000000b - 256 001000000000b - 512 010000000000b - 1024 **NOTE** This field should be programmed by software during initialization mode, SIPI_MCR[INIT] = 1. Writes during other times are ignored. **NOTE** Writes to SIPI_MCR[PRSCLR] can only be accomplished with 16-bit or 32-bit writes.

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-14 AID	Address Increment/Decrement These bits define the type of address change at the target node. **NOTE** This bits should be programmed by software in initialization mode, SIPI_MCR[INIT] = 1. Writes during other times are ignored. 00b - no change. address stays same 01b - address increments by 4 10b - address decrements by 4 11b - not used
13-11 —	Reserved
10 CRCIE	CRC Error Interrupt Enable 0b - Interrupt is disabled 1b - Interrupt is enabled
9 MCRIE	Max Count Reached Interrupt Enable 0b - Interrupt is disabled 1b - Interrupt is enabled
8-6 —	Reserved
5 LEGACY_MODE_BIT	Legacy_mode select bit. 0b - The write command is triggered with CDR update and read command with CAR update. 1b - The write command and read command, both are triggered with CAR update
4 CHNSB	Channel coding select bit. 0b - Code Table II (see Table 735) 1b - Code Table I (see Table 735)
3 TEN	Target Enable Setting this bit enables the target functionality at SIPI. This bit can be read or written anytime. This bit is automatically negated by hardware when target detects an error in "streaming without ACK" mode. This bit has to be enabled for the transmission operations also.
2 INIT	Initialization Mode Setting this bit puts the module in initialization mode. This bit should be cleared by software. Most register bits are configured using this bit. The SIPI_MCR[MOEN] bit needs to be set first, and then the INIT bit can be set and both bits can't be enabled together.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Normal Mode 1b - Initialization Mode
1 MOEN	Module Enable This bit should be set or cleared by software. When this bit is negated, future SIPI Tx transfers are disabled.
0 SR	Soft Reset Setting this bit clears all status and error registers, and FSMs are moved to idle state. This bit is automatically cleared by hardware once the reset operation is complete.

82.7.31 SIPI Status Register (SR)

Offset

Register	Offset
SR	A0h

Function

The SIPI_SR is the global status register of SIPI.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31 FRZACK	FRZACK

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Freeze Mode Acknowledge. This read-only bit indicates that SIPI is in Freeze mode. The Freeze mode request cannot be granted until current transmission or reception processes have finished. The software can poll the FRZACK bit to find when the SIPI has actually entered Freeze mode. If Freeze mode is requested while SIPI is in any of the low power modes, then the FRZACK bit will only be set when the low power mode is exited. 0b - SIPI not in Freeze mode 1b - SIPI in Freeze mode
30 LPMACK	Low Power Mode Acknowledge. This read-only bit indicates that SIPI is in Disable Modeor Doze mode. Disable mode The low power modes can not be entered until all current transmission or reception processes have finished. The CPU can poll the LPMACK bit to know when SIPI has actually entered low power mode. **NOTE** Reset value will be 1 for only one clock cycle. 0b - SIPI is not in low power mode 1b - SIPI is in Disable Mode or Doze mode.
29-14 —	Reserved
13 INVALID_FRAME_RX	INVALID_FRAME_RX Indicates if the received frame is invalid, i.e. the SIPI header command is unknown or streaming write is done on channel other than 2 . 0b - No invalid frame received 1b - Invalid frame received
12 READ_OK_TX	READ_OK_TX READ or ID ACK Transmit Bit. 0b - No Read or ID ACK Transmitted 1b - Read or ID ACK Transmitted
11 ACK_TX	ACK_TX ACK Transmit Bit. 0b - No ACK Transmitted 1b - ACK Transmitted
10 GCRCE	GCRCE Global CRC Error Bit. 0b - No CRC error

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - CRC error occurred
9 MCR	Maximum Count Reached. This bit will be set whenever SIPI_ACR[ADCNT] = SIPI_MAXCR[MXCNT]. An interrupt will be generated when this bit is set only if SIPI_MCR[MCRIE] = 1. This it should be cleared by software.
8 FRAME_TX	FRAME_TX . This bit will be set whenever a frame is transmitted from the initiator side. 0b - No frame transmitted 1b - Any frame type transmitted
7-4 TE	TE Trigger Event on Respective Channels. This field enables interrupts for target nodes. 1xxxb - TE3 = 1 - Channel 3 trigger event x1xxb - TE2 = 1 - Channel 2 trigger event xx1xb - TE1 = 1 - Channel 1 trigger event xxx1b - TE0 = 1 - Channel 0 trigger event
3-0 STATE	STATE These bits reflect the transmit state machine status. They can be polled for determination of state machine status. 0000b - IDLE 0001b - HEADER_AND_ADDRESS_FIELD 0010b - HEADER_AND_DATA_FIELD 0011b - HEADER_AND_CRC_FIELD 0100b - ADDRESS_AND_CRC_FIELD 0101b - ADDRESS_AND_DATA_FIELD 0110b - DATA_AND_CRC_FIELD 0111b - DATA_FIELD

82.7.32 SIPI Max Count Register (MAXCR)

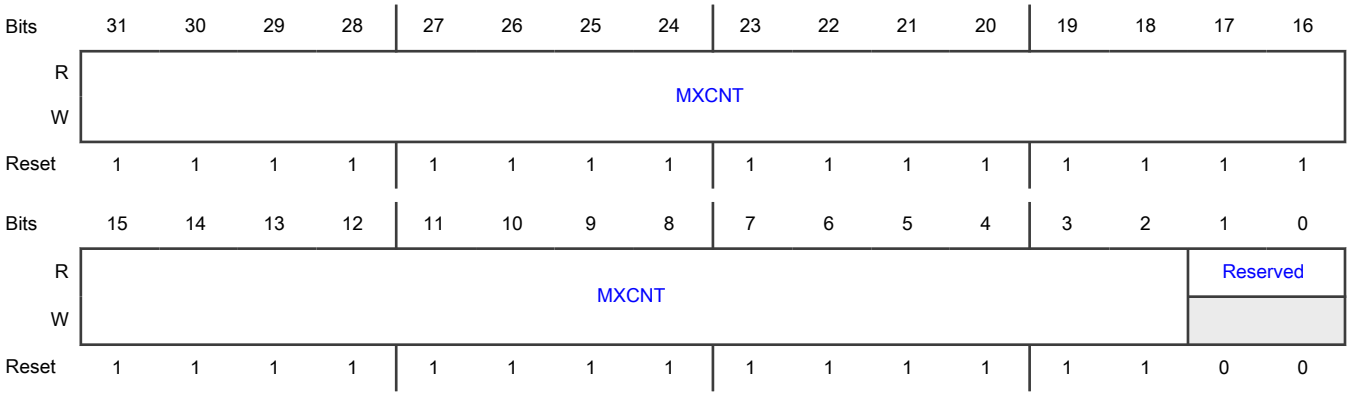
Offset

Register	Offset
MAXCR	A4h

Function

SIPI_MAXCR contains the maximum address count value at target node. It is programmed via direct write request through the initiator. This register can be read or written by software anytime.

Diagram



Fields

Field	Function
31-2 MXCNT	MXCNT This field contains the maximum address count value at the target node. It should be programmed via direct write request through the initiator.
1-0 —	Reserved

82.7.33 SIPI Address Reload Register (ARR)

Offset

Register	Offset
ARR	A8h

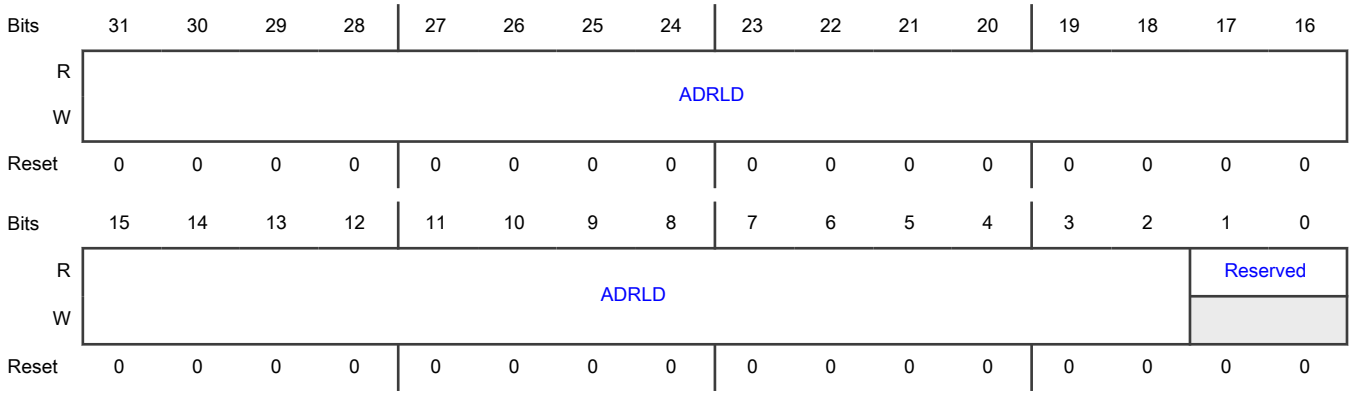
Function

The SIPI_ARR contains the reload value for the address counter at the target node. It should be configured by direct write request from the initiator.

NOTE

This register is writeable only when SIPI_MCR[INIT] = 1.

Diagram



Fields

Field	Function
31-2 ADRLD	ADRLD ADRLD contains the reload value for the address counter at the target node. It should be configured by direct write request from the initiator.
1-0 —	Reserved

82.7.34 SIPI Address Count Register (ACR)

Offset

Register	Offset
ACR	ACh

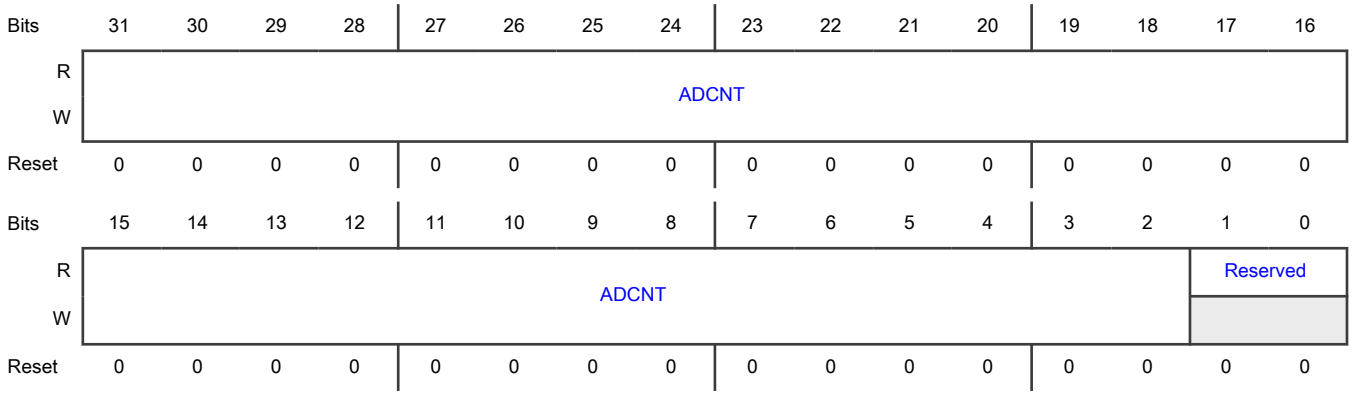
Function

This register reflects the count value of address counter at target node. It should be configured by direct write request from initiator. This register can be read/written by software anytime.

NOTE

- SIPI_ARR, SIPI_ACR and SIPI_MAXCR will be configured by direct write operation through the initiator.
- When a streaming write command is received, the target will start the write operation from the address present in SIPI_ACR (address count register).
- After each 32-bit write has completed, SIPI_ACR[ADCNT] is compared against SIPI_MAXCR[MXCNT]. If they are equal, SIPI_ACR[ADCNT] is loaded with the value stored in SIPI_ARR[ADRLD]. If they are not equal, the SIPI_ACR[ADCNT] will increment by 4, decrement by 4 or remain the same (depending on configuration). In both cases, the SIPI_ACR[ADCNT] will contain the address at which the next streaming write will occur.
- SIPI will not update ACR with ARR value in case the last beat in stream transaction reaches MAXCR address.

Diagram



Fields

Field	Function
31-2 ADCNT	Feflects the count value of address counter at target node. It should be configured by direct write request from the initiator. This register can be read/written by software anytime. At the end of the streaming operation, SIPI_ACR will point to the next address to be written.
1-0 —	Reserved

82.7.35 SIPI Error Register (ERR)

Offset

Register	Offset
ERR	B0h

Function

This register contains the error bits for the last transaction(s) for all the channels. Communication errors are generated only for out of range address accesses, areas that are read only and where accesses do not lead to generation of transfer errors. Also, writing to read only registers will not generate errors.

23-16 BIN2	BIN2 Stores the number of frames whose turn around time is between 2^10 to 2^11 cycles
15-8 BIN1	BIN1 Stores the number of frames whose turn around time is between 2^9 to 2^10 cycles
7-0 BIN0	BIN0 Stores the number of frames whose turn around time is between 2^8 to 2^9 cycles

82.8 Transfer types

This section describes the available transfer types for the SIPI module. The SIPI frame is inserted inside the payload of the LFAST frame as shown in the following figures.

82.8.1 Read transfer

A read transfer can be of two types:

- Read Request Transfer (at the Initiator node)

- Read Response Transfer (at the Target node)

82.8.1.1 Register read request transfer

In case of a read request transfer, the Initiator node sends Header, Address, and CRC bits as shown in the following figure.

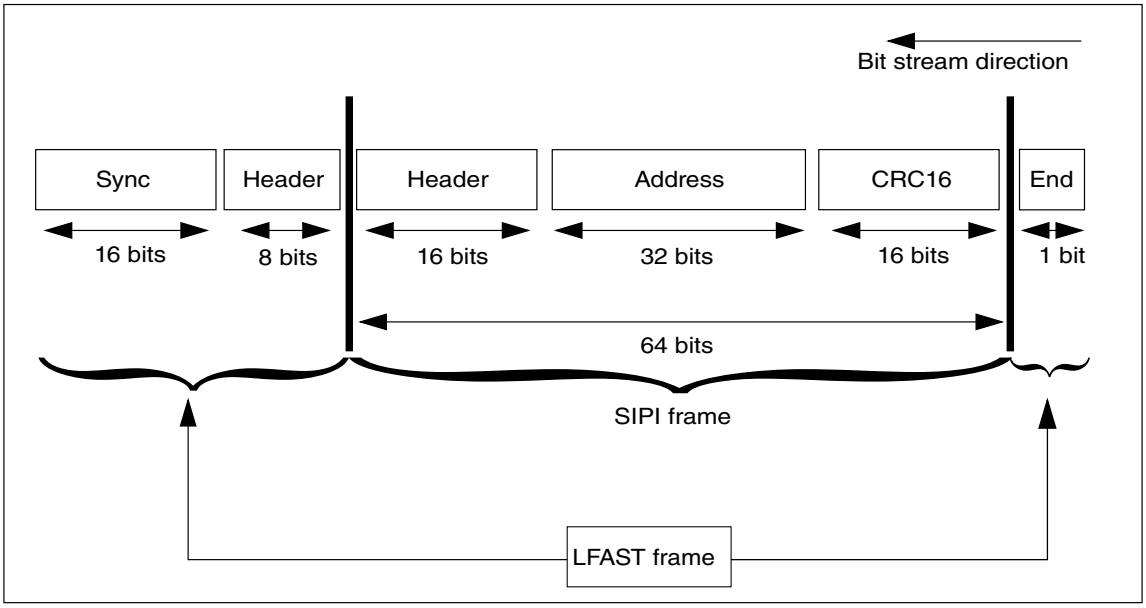

Figure 630. Read request transfer

82.8.2 Register read answer transfer

In response to a read request by the Initiator node, the Target node sends header, payload and CRC16. Data transfer could be in 8-bit, 16-bit, or 32-bit modes (see Figure 631). In case of 8-bit or 16-bit modes, copies of the SIPI data are sent in the payload (see Figure 632).

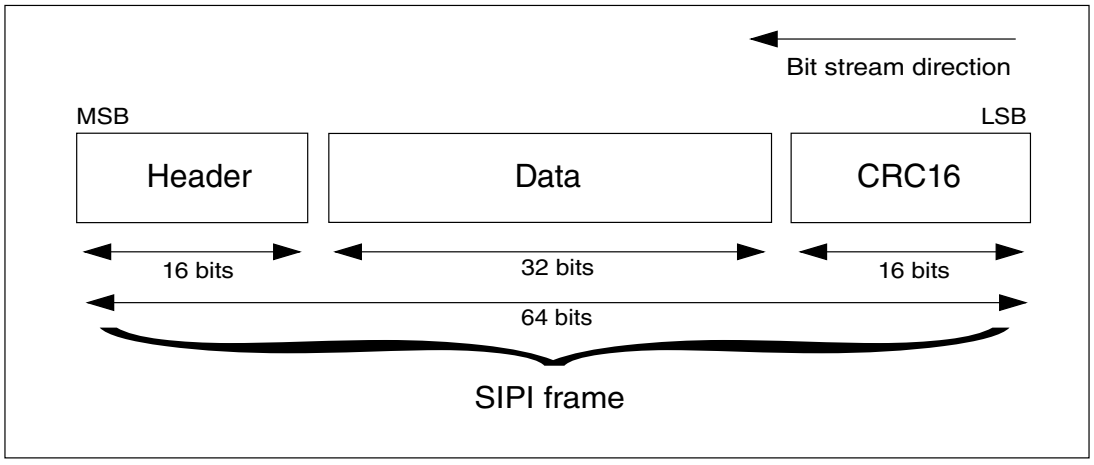

Figure 631. Read answer transfer

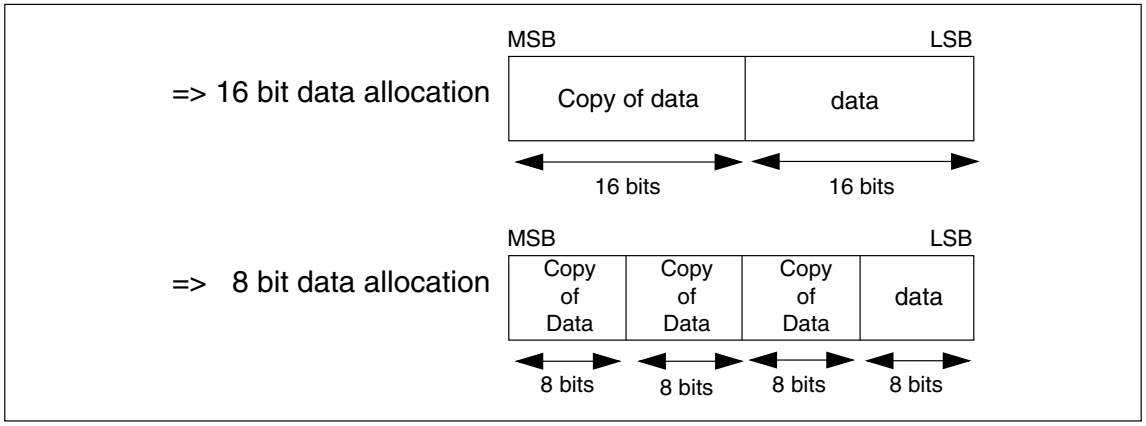

Figure 632. Data allocation

NOTE

- For an 8-bit transfer, SIPI uses address bits [31:2] as address and bits [1:0] as byte enables.
  - Bits[1:0]:
    - 00 - byte 3 enabled (MSB)
    - 01 - byte 2 enabled
    - 10 - byte 1 enabled
    - 11 - byte 0 enabled (LSB)
- For a 16-bit transfer, SIPI uses address bits [31:1] as address and bit [0] as halfword enable.
  - Bit[0]:
    - 0 - halfword 1 enabled (MSB)
    - 1 - halfword 0 enabled (LSB)

82.8.3 Register write transfer

Register write transfers can be of two types:

- Normal write transfer—applies to channels 0, 1, 2, and 3
- Streaming data transfer—applies to channel 2 only

A register write transfer can be performed through a normal write transfer for channels 0, 1, 2, and 3 (see Normal write transfer as shown in Figure 633.

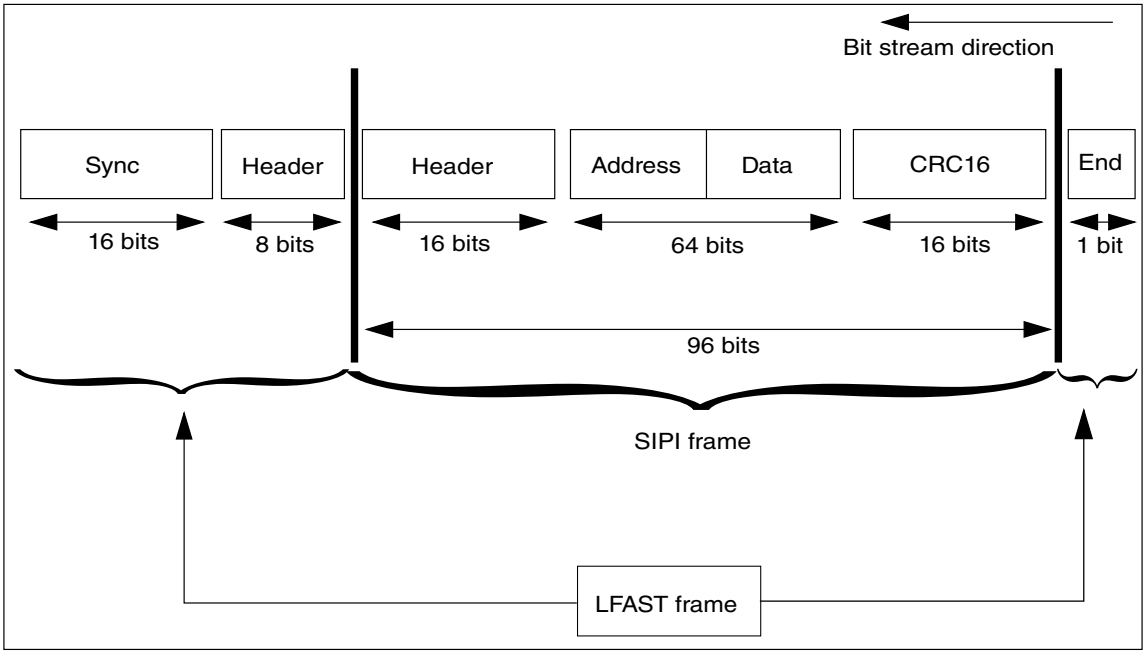

Figure 633. Register write transfer (showing LFAST frame encapsulation)

82.8.3.1 Normal write transfer

A normal write transfer contains header, address, data (32-bit), and CRC as shown in the following figure.

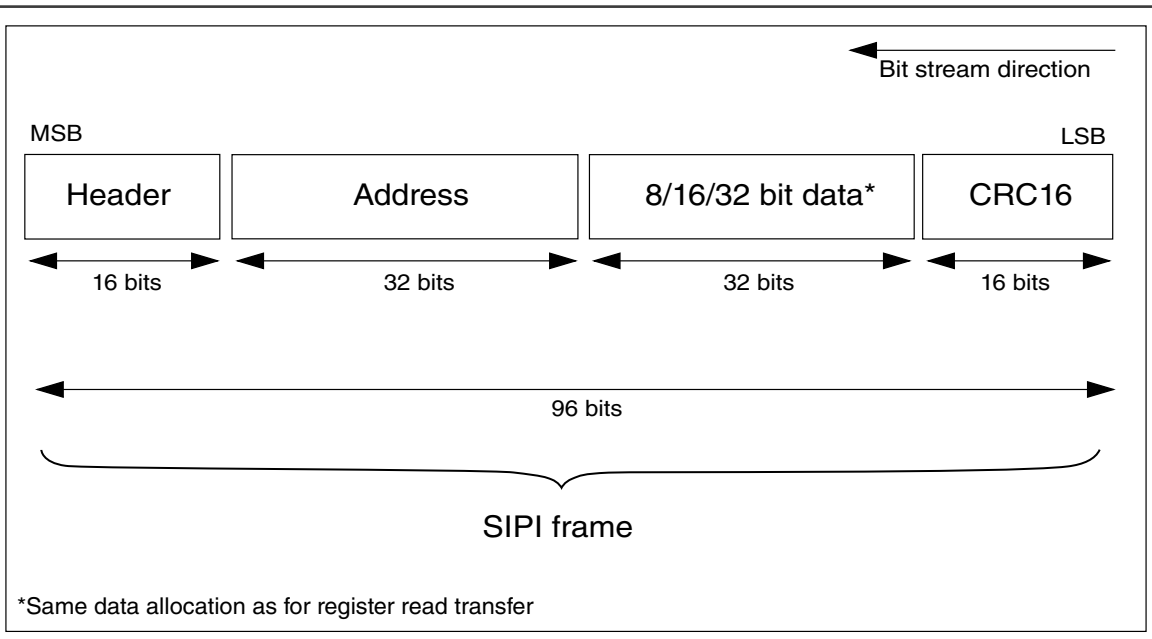

Figure 634. Write transfer (LFAST frame encapsulation is not shown)

NOTE

- For an 8-bit transfer, SIPI uses address bits [31:2] as address and bits [1:0] as byte enables.
  - Bits[1:0]:

- 00 - byte 3 enabled (MSB)
- 01 - byte 2 enabled
- 10 - byte 1 enabled
- 11 - byte 0 enabled (LSB)

- For a 16-bit transfer, SIPI uses address bits [31:1] as address and bit [0] as half-word enable.
  - Bit[0]:
    - 0 - half-word 1 enabled (MSB)
    - 1 - half-word 0 enabled (LSB)

82.8.3.2 Streaming write transfer

Streaming write transfer has 256 bits of payload.

82.8.3.2.1 Streaming write transfer with address

SIPI performs address setting using a direct write transfer. The MAXCR and ARR are written before ACR. This is to stop SIPI from accessing non-shared memory and is only true for the first streaming command; subsequent streaming command(s) may not need to write to MAXRC and ARR.

82.8.3.2.2 Streaming transfer with data

The following figure shows the packet structure of the streaming transfer containing data.

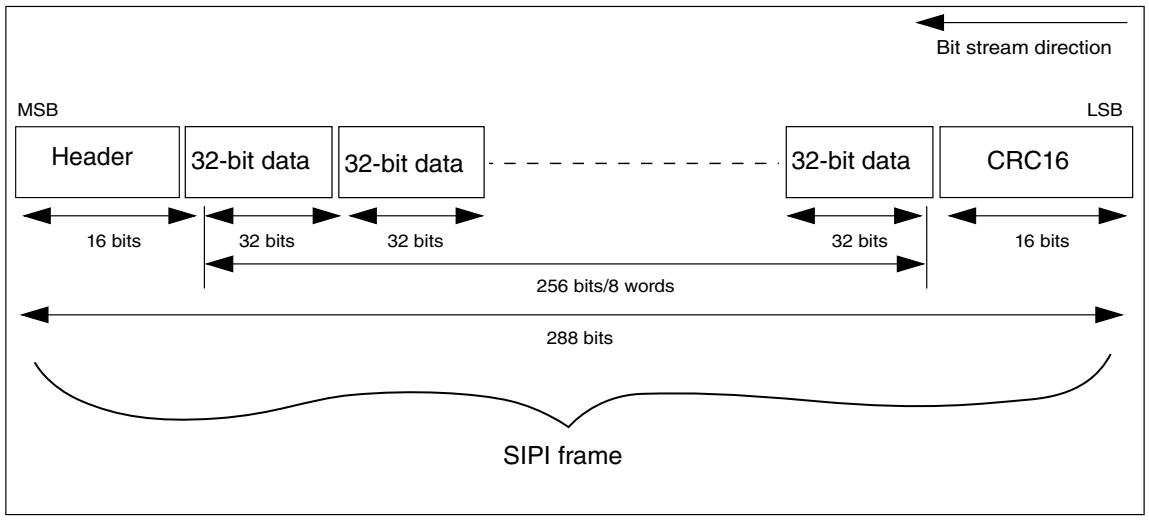

Figure 635. Streaming transfer with data

82.8.4 Write acknowledge transfer

A write acknowledge transfer contains only header and CRC bits (see the following figure). These bits are calculated on the Header field.

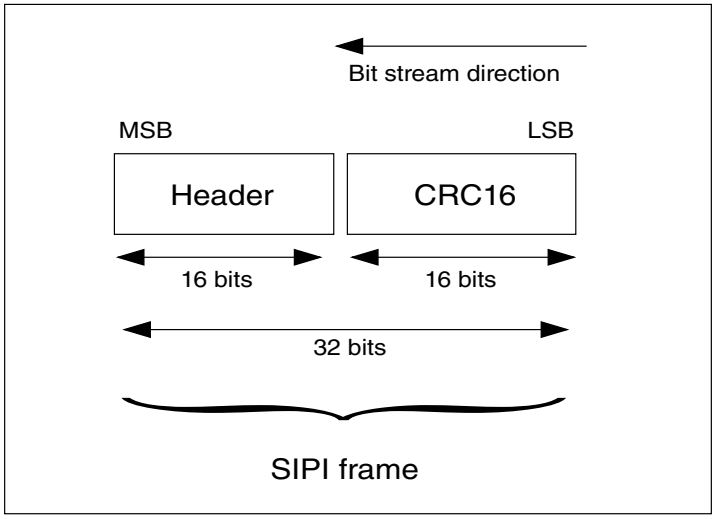

Figure 636. Write acknowledge transfer (LFAST encapsulation is not shown)

82.8.5 ID request response

82.8.5.1 ID request transfer

The Initiator node transmits an ID request, as shown in the following figure.

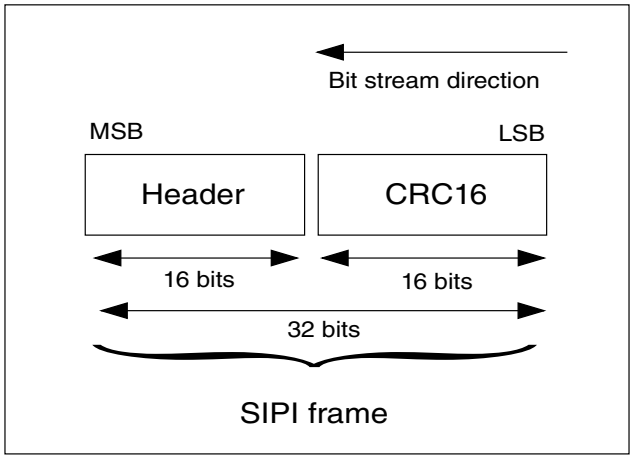

Figure 637. ID request transfer (LFAST encapsulation is not shown)

82.8.5.2 ID request response transfer

The Target node transmits an ID request response, as shown in the following figure.

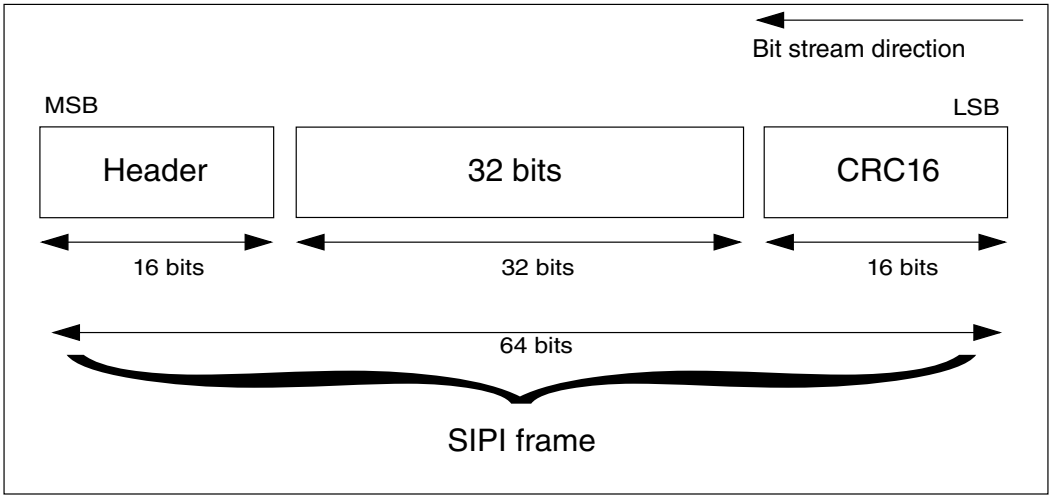

Figure 638. ID request response transfer

NOTE

The ID request response contains the value of the CHIP ID instead of the data.

82.9 Transfer API and flow charts

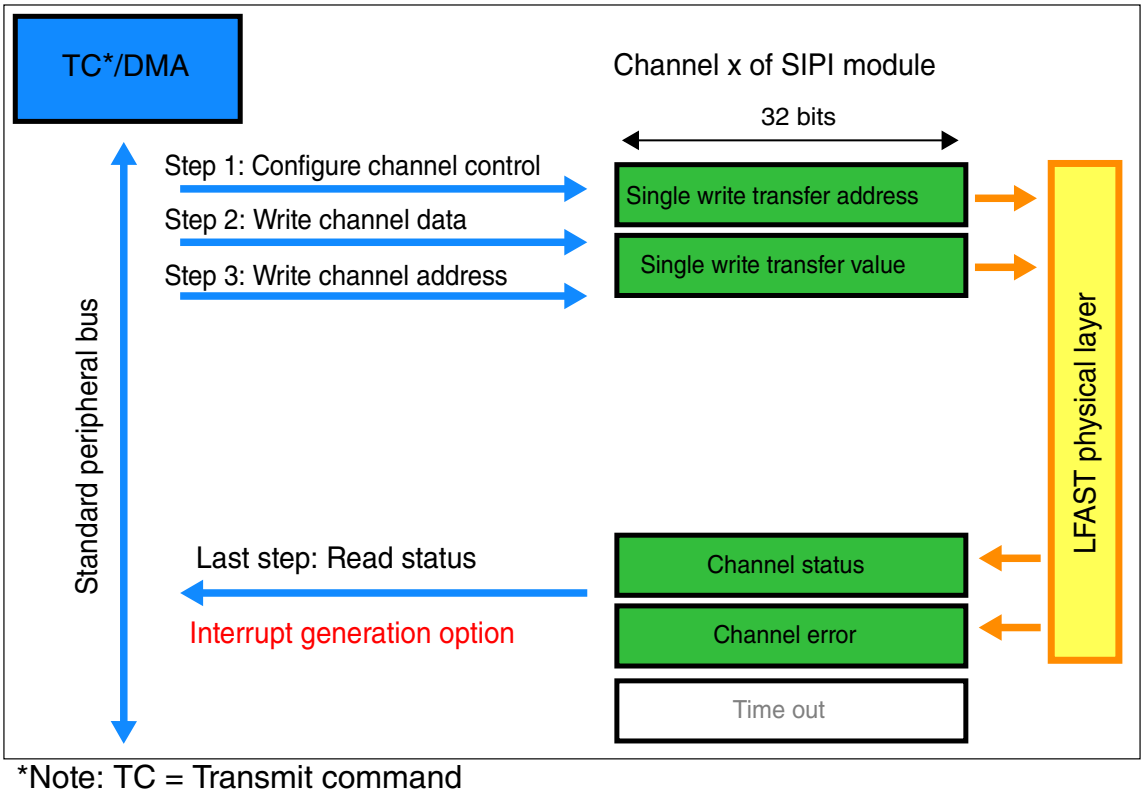

Figure 639. SIPI single register write API

If LEGACY_MODE_BIT bit is set to 1, then perform the following steps to generate a single write transfer request Steps to generate a single write transfer (see Figure 639):

1. Configure data and CCR*n* at the Initiator node.
2. Configure CAR*n* at the Initiator node.

   As soon as the Channel address register (CAR*n*) is written and if CCR*n*[CHEN] = 1, the initiator SIPI calculates the CRC on Header, Address, and Data fields and starts transmitting data to LFAST.

If LEGACY_MODE_BIT bit is set to 0, then perform the following steps to generate a single write transfer request:

1. Configure CCR*n* at the Initiator node.
2. Configure CAR*n* at the Initiator node.
3. Configure CDR*n* at the Initiator node.
4. As soon as the Channel data register (CDR*n*) is written and if CCR*n*[CHEN] = 1, the initiator SIPI calculates the CRC on Header, Address, and Data fields and starts transmitting data to LFAST.

The software polls the status register bits (CSR*n*) to determine when the request completes, CSR*n*[ACKR] = 1, and generates an interrupt if the corresponding CIR*n*[ACKIE] = 1.

On a single write transfer request reception (see Figure 640):

1. The Target node places the address, data, and control information on its AHB master interface.
2. When the process completes, the Target node generates an acknowledge frame and sends it back to LFAST.

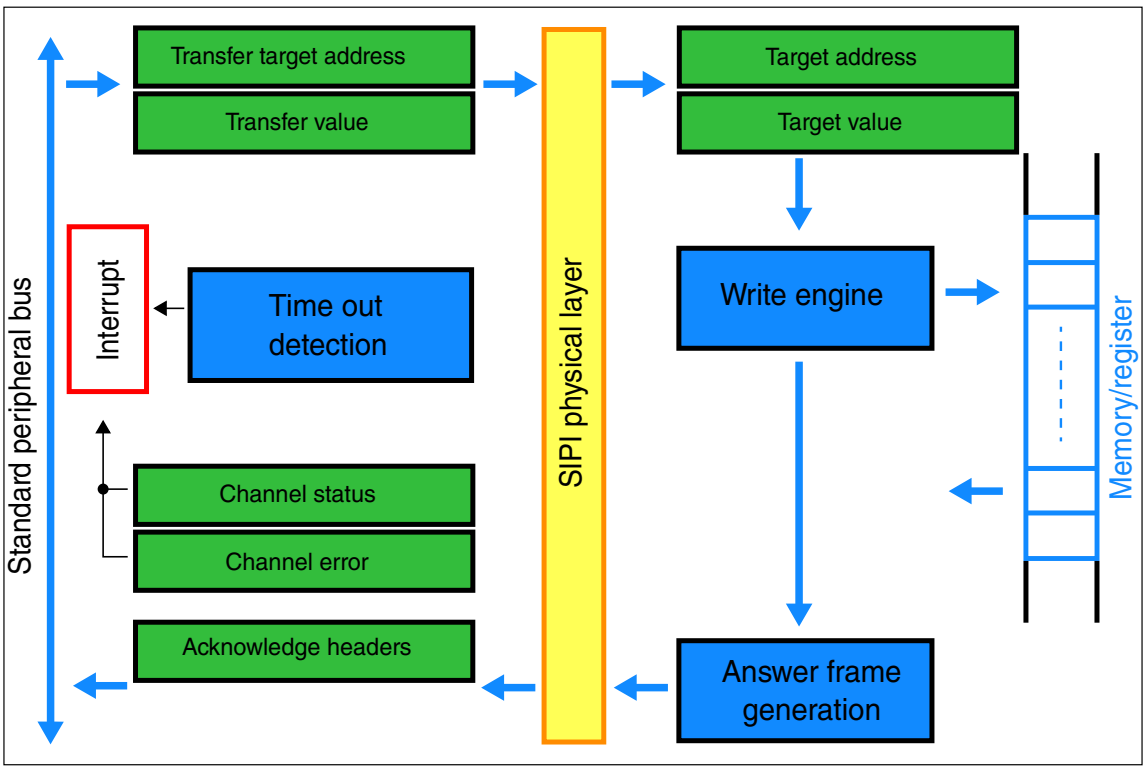

Figure 640. SIPI single register write API - flow chart

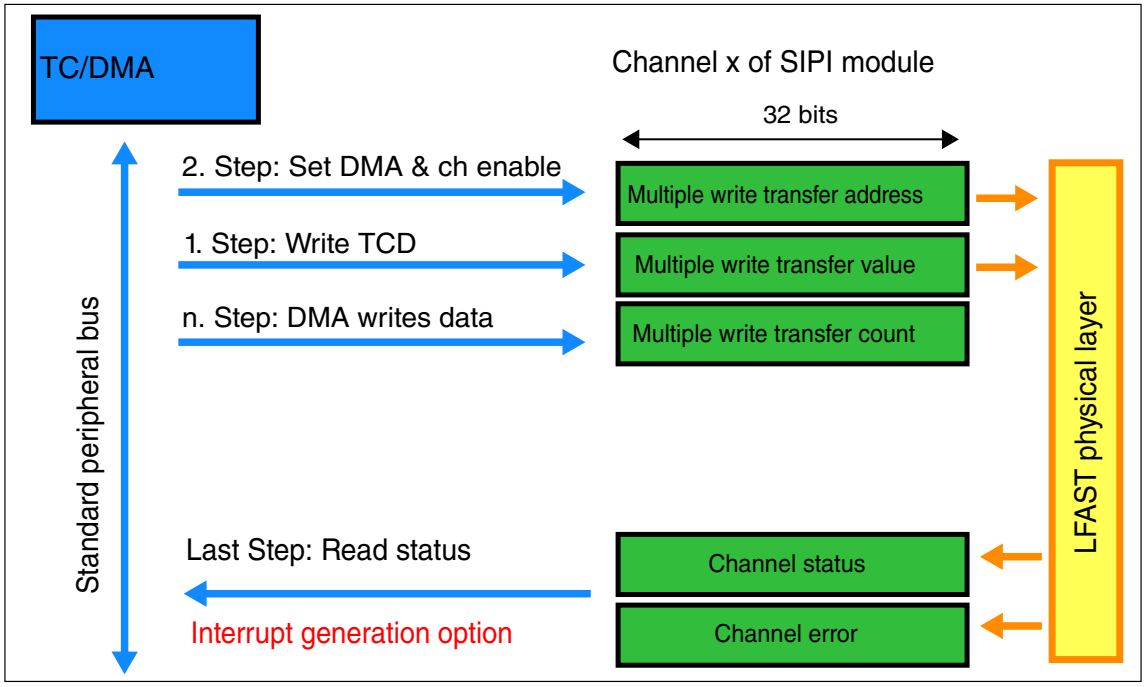

Figure 641. SIPI multiple register write API

For multiple write transfer request generation (see Figure 641):

1. The software configures Transfer Control Descriptor (TCD) of DMA.
2. The software writes CCR*n*[CHEN] = 1 and CCR*n*[DEN] = 1.
3. SIPI starts copying data to the CDR*n* through its DMA interface, depending on the transfer count and the size of data registers. CDR2_0 must be written with MSB.
4. After the data is copied, initiator SIPI calculates CRC on the Header, Address, and Data fields, and starts transmitting data to LFAST.
5. The software must poll the CSR*n* Status Register bits to determine if the request is complete. If CSR*n*[ACKR] = 1, it generates an interrupt (if the corresponding CIR*n*[ACKIE] = 1).
6. If CCR*n*[DEN] = 1, the SIPI request transfers to the DMA controller. If not, the state machine will go idle.
7. The software repeats steps 4-7.

On multiple write transfer request reception (see Figure 641):

1. The Target node places the address, data, and control information on its AHB master interface.
2. After the process is complete, the Target node generates an acknowledge frame and sends it to LFAST.

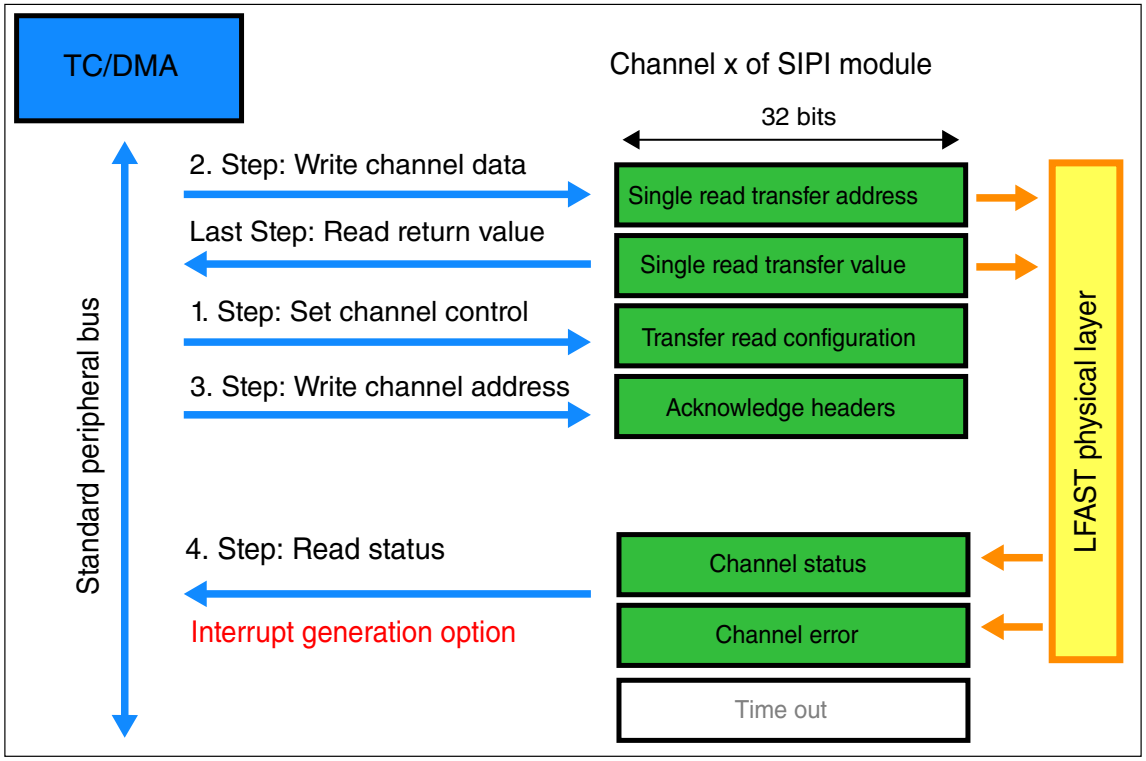

Figure 642. SIPI single register read API

For single read transfer request generation (see Figure 642):

1. The software/DMA configures CCR*n* and CDR*n*; writing CAR*n* as the last step.
2. As soon as the software writes to the CAR, initiator SIPI calculates CRC of the Header and Address fields and starts transmitting data to LFAST.
3. The software should poll CSR*n* to determine if the request is complete. If CSR*n*[RAR] = 1 and CIR*n*[RAIE] = 1, an interrupt generates. If CSR*n*[RAR] is not set, then ERR[TOE*n*] = 1 indicates that a timeout has occured.
4. If CSR*n*[RAR] = 1, then the software can read the data register, or can perform another necessary action if CSR*n*[RAR] = 0.

On single read transfer request reception (see Figure 642):

1. The Target node places the address and control information on its AHB master interface.
2. When the process in complete, the Target node sends the read response back to LFAST.

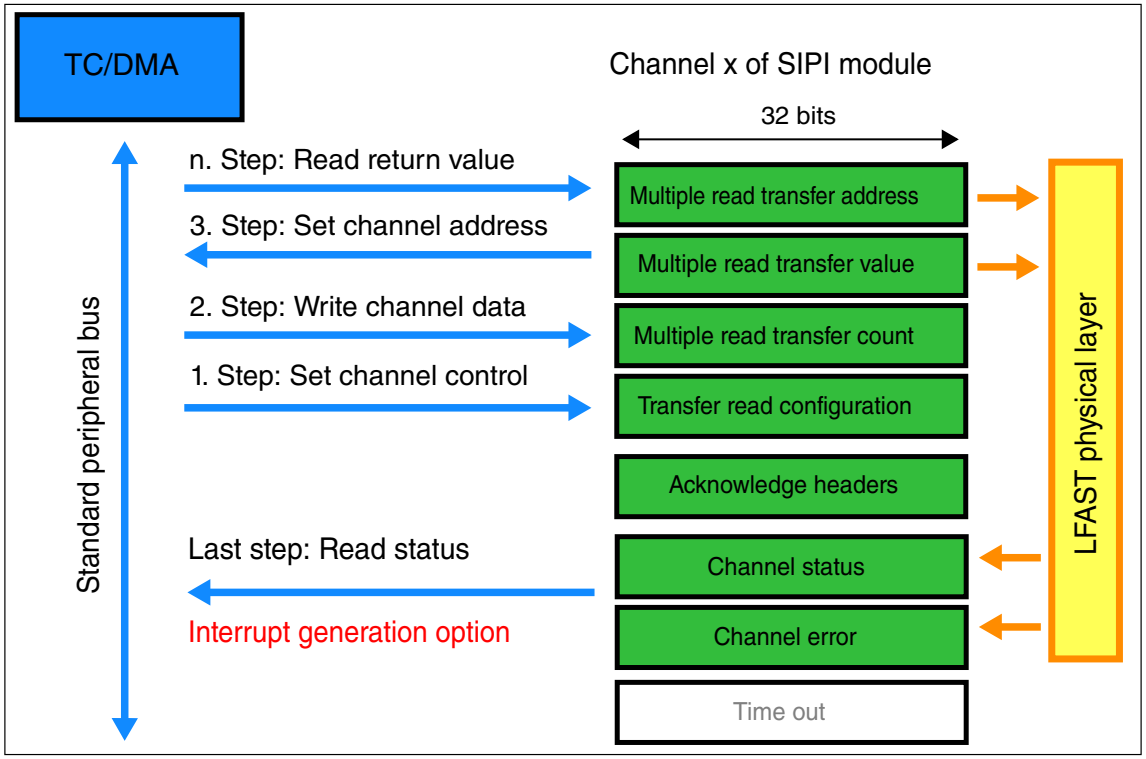

Figure 643. SIPI multiple register read API

For multiple read transfer request generation (see Figure 643):

1. The software/DMA configures CCR*n* and CDR*n*; writing CAR*n* as the last step.
2. As soon as the CAR is written, initiator SIPI calculates CRC on the Header and Address fields, and then starts transmitting data to LFAST.
3. The software should poll CSR*n* to determine if the request is complete. If CSR*n*[RAR] = 1 and CIR*n*[RAIE] = 1, an interrupt generates. If CSR*n*[RAR] is not set, then ERR[TOE*n*] = 1 indicates that a timeout has occured.
4. The software repeats steps 2-3 for multiple requests.

On multiple read transfer request reception (see Figure 643):

1. The Target node starts reading data through its AHB interface.
2. After the transfer is complete or all the data registers are full, it calculates CRC and sends the response frame back to LFAST.

NOTE

The hardware also clears the read answer interrupt pins in DMA transfers. This can lead the software in trouble if it tracks the requests by counting the number of times the interrupt was received and cleared.

See Figure 644, Figure 645, Figure 646, and Figure 647 that show the SIPI data streaming of data.

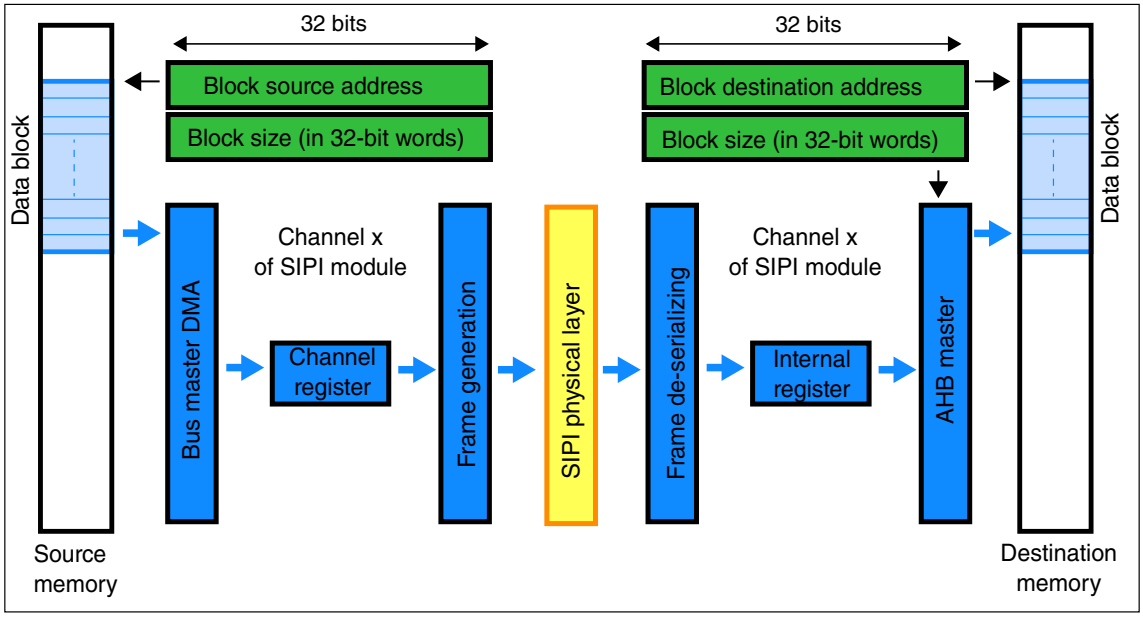

Figure 644. SIPI data stream model

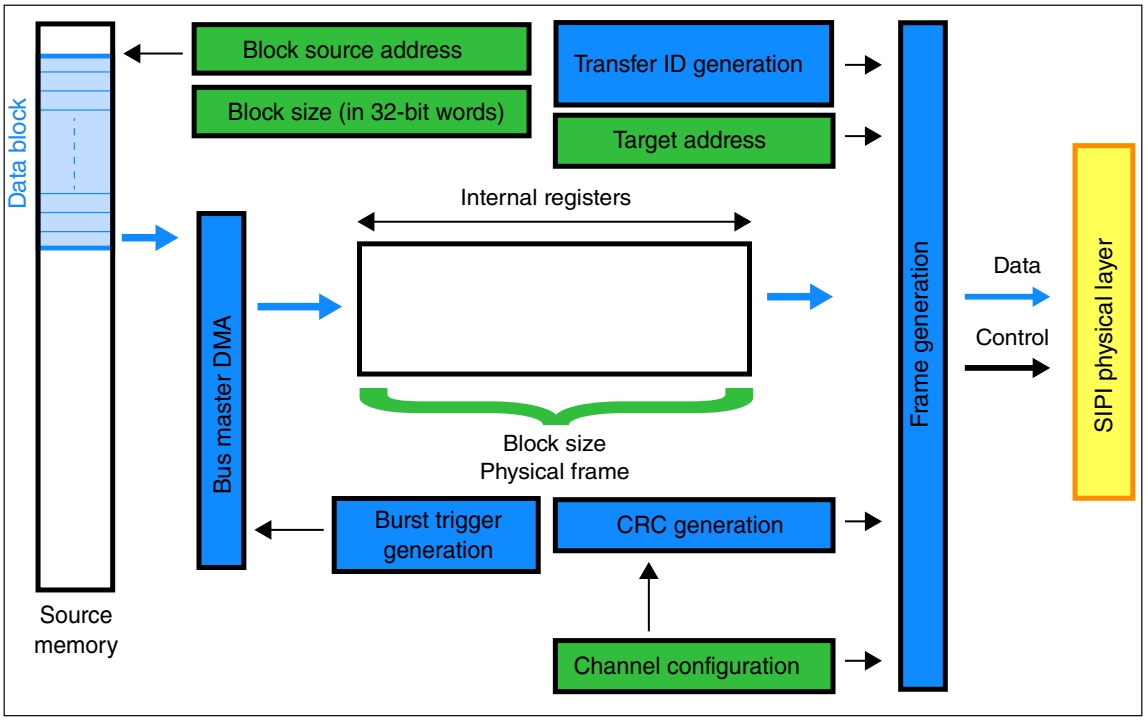

Figure 645. SIPI data stream model - Initiator

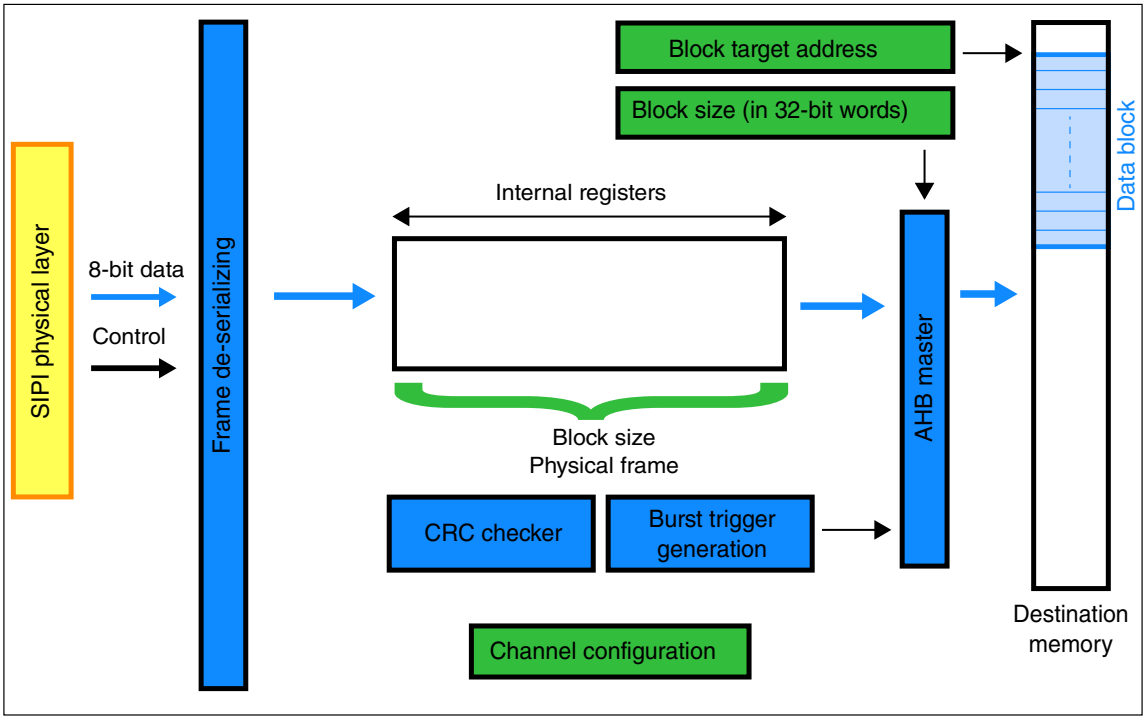

Figure 646. SIPI data stream model - Target

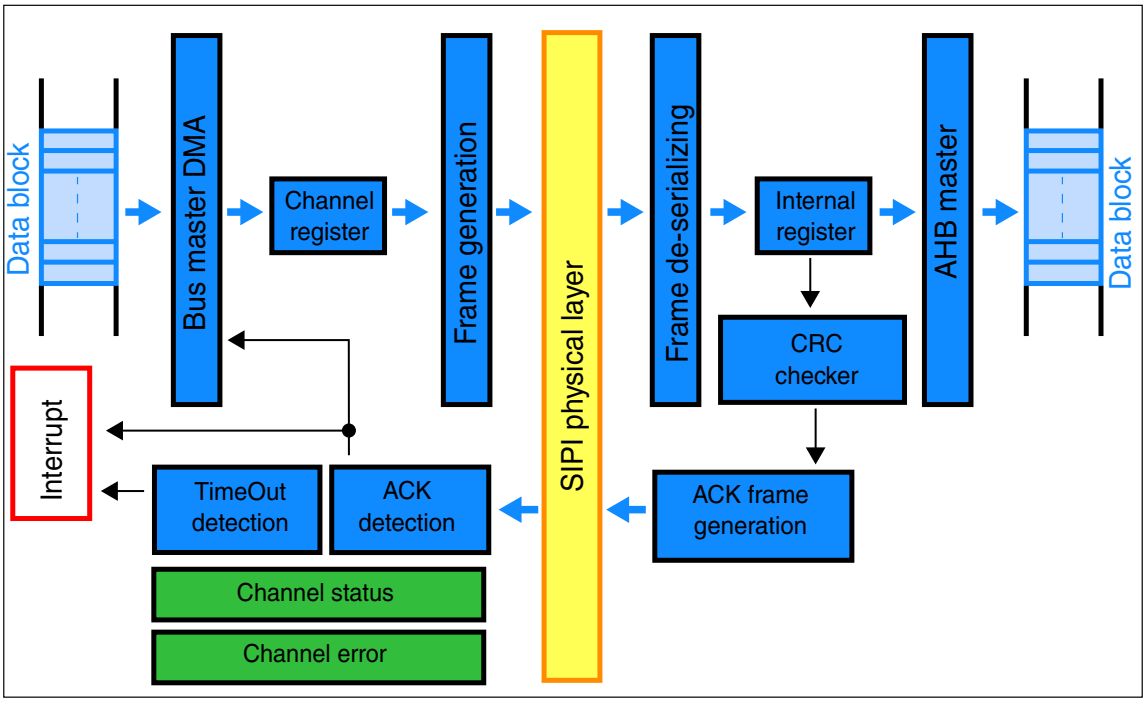

Figure 647. SIPI data stream with acknowledge trigger

82.10 DMA programming sequence

The DMA programming sequence is as follows:

1. Check whether the channel is ready for by reading CCRx[DEN]=0.

2. Check no error on the channel by reading ERR[TOEx]=0,ERR[TIDEx]=0 and ERR[ACKEx]=0.
3. Enable the channel by writing CCRn[CHEN]=1.
4. Select the operation by writing to the CCRx[RRT]=1 or CCRx[WRT]=1 or CCR2[ST]=1.
5. Program the transaction size by writing to the CCRx[WL].
6. Incase of write program the data register CDRx[CDR]. The whole frame data should be programmed altogether, in one minor loop.
7. Program the target node address, by writing on register CARx[CAR].

   If MCR[LEGACY_MODE_BIT]=0, the programming of CARz[CAR] is not needed for stream write
8. Incase of multiple minor loops go back to step 6. Once SIPI has transmitted the frame it will accept new commands from the DMA.
9. Incase of completion of major loop go back to step 1. Once SIPI completes the transaction it will set CCRx[DEN]=0.
10. If an error occurs:
    - SIPI generates an interrupt.
    - Software takes control of SIPI.

82.11 Modes of operation

SIPI supports three modes of operation:

- Initialization
- Normal
- Module Disable

After hardware reset, SIPI is in the Module Disable mode, which helps reduce power consumption.

82.11.1 Initialization mode

To enter the Initialization mode, software writes MCR[INIT]=1, and MCR[MOEN] must be set before attempting to write to MCR[INIT]. To exit the Initialization mode, the software writes MCR[INIT]=0.

NOTE

It is recommended that the software checks the state of MCR[MOEN] before setting the MCR[INIT] field.

82.11.2 Normal mode

After the software completes SIPI initialization (MCR[INIT] = 1), it can enter the Normal mode by writing MCR[INIT]=0. SIPI needs to be in the Normal mode for all data transfers.

NOTE

SIPI must be enabled before attempting to write MCR[MOEN]=1.

82.11.3 Module Disable (MD) mode

The MD mode in SIPI reduces power consumption. By default, SIPI is in the Disable mode, MCR[MOEN]=0, and exits by writing MCR[MOEN]=1. Future SIPI Tx transfers are disabled in this mode. To disable the Rx functionality, the Target Enable (TEN) field needs to be deasserted, and then the internal Rx state machine resets to the initial state.

82.12 Errors

This section describes the potential errors that can occur during a SIPI operation.

82.12.1 Timeout error

The module generates a timeout error at the Initiator node when the acknowledge/response is not received within the time configured in the corresponding CTOR*n*[TOR] field setting. It indicates a timeout error when ERR[TOE*n*] = 1.

NOTE

SIPI should not drop the response even after a timeout occurs. The software polls both the error and status flags after the transfer to see if there was a timeout error. In case of an error, the response received may be discarded.

82.12.2 CRC error

The module generates a CRC error at the Target nodes when the CRC received with the frame does not match the calculated CRC, and the SR[GCRCE] field is set. An interrupt is asserted if MCR[CRCIE]=1.

NOTE

The Target node does not send an acknowledge to the Initiator node when a CRC error is generated. An interrupt is generated on the target side if the corresponding interrupt enable bit is set. The Initiator node detects a timeout and takes the necessary action.

82.12.3 Maximum count reached error

The module generates the maximum count reached error at the Target node when the value of ACR is equal to that of MAXCR register. When ACR is equal to MAXCR, then SR[MCR]=1. SIPI triggers an interrupt if the interrupt is enabled, MCR[MCRIE]=1.

82.12.4 Transaction ID error

The module generates the Transaction ID (TID) error at the Initiator node only, when header bits 15-13 do not match CSR*n*[TID].

CSR*n*[TIDE]=1 when a TID error is detected, and an interrupt is generated if CIR*n*[TIDIE]=1.

82.12.5 Acknowledge error

When the acknowledge sent by an initiator is incorrect, ERR[ACKR*n*] is set. An interrupt is generated if CIR*n*[WAIE]=1.

82.13 CRC calculation

If header is AABBh, address is 1122_3344h, and data is CCDD_EEFFh, the module performs CRC calculation as follows :

1) The CRC seed is initialized by FFFF_FFFFh.

2) All the data is mirrored before sending to the CRC engine (for example, MSB is sent as LSB).

3) The header is sent as DD55_0000h.

4) The address is sent as 22CC_4488h.

5) The data is sent as FF77_BB33h.

82.14 Interrupt logic

A description of the interrupt logic is provided in the following figure.

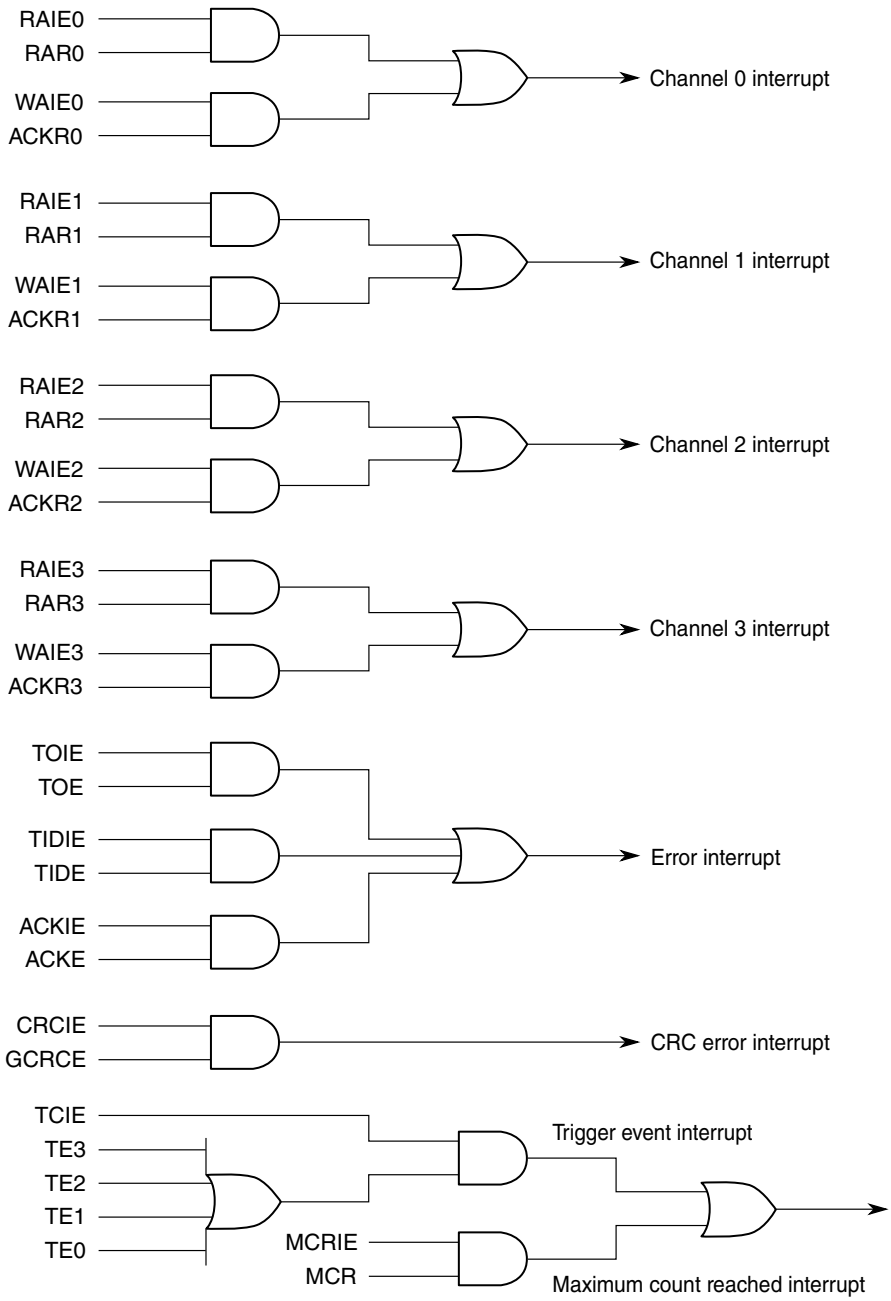

Figure 648. Interrupt description

82.15 SIPI control and status overview

The following figure shows the relationship between transfers and the SIPI control and status registers.

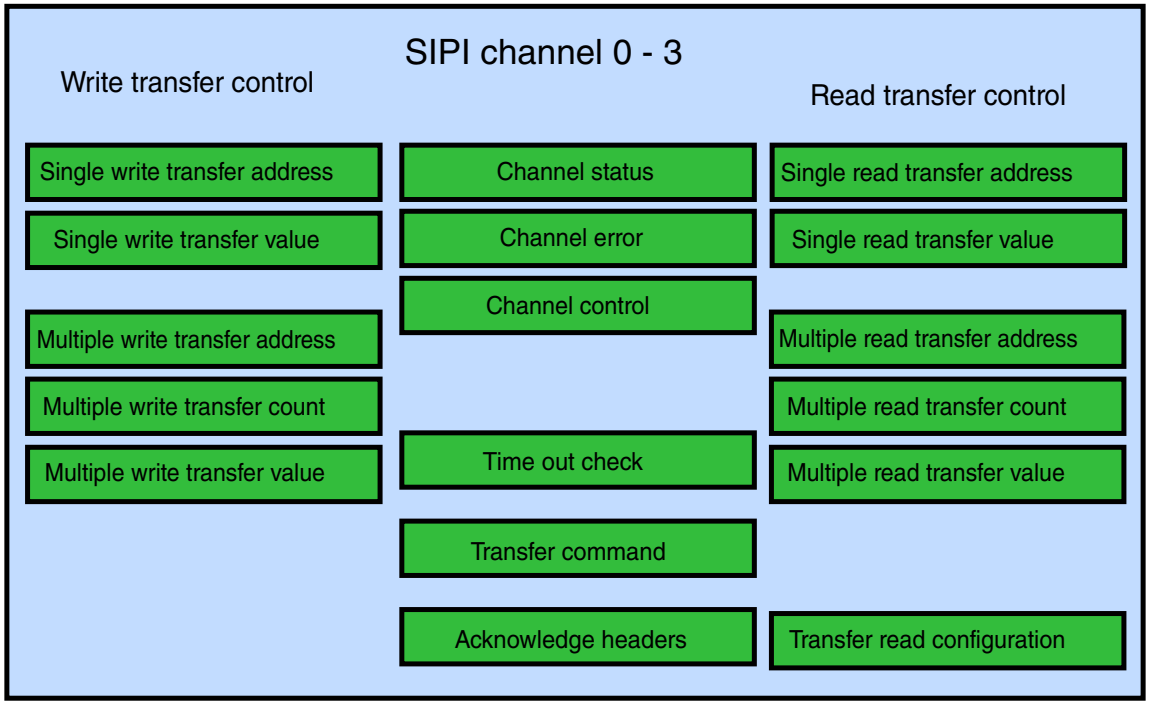

Figure 649. SIPI control and status overview - register transfer

Chapter 83
LVDS Fast Asynchronous Serial Transmission (LFAST)

83.1 Chip-specific LFAST information

83.1.1 LFAST instances and configuration

One instance of LFAST is instantiated.

Table 738. LFAST configuration

Configuration	S32K396
Transmit data FIFO width	32
Receive data FIFO width	32
Transmit data FIFO depth	38
Receive data FIFO depth	38
Transmit/Receive header FIFO width	6
Transmit/Receive header FIFO depth	6

83.2 Overview

This chapter describes the specifications of the LFAST module, which implements the LVDS Fast Asynchronous Serial Transmission (LFAST) module. LFAST is used in dual mode (software configurable master/slave operation) for interprocessor communications.

83.2.1 Block diagram

Figure 650 depicts LFAST interaction with other modules on the device.

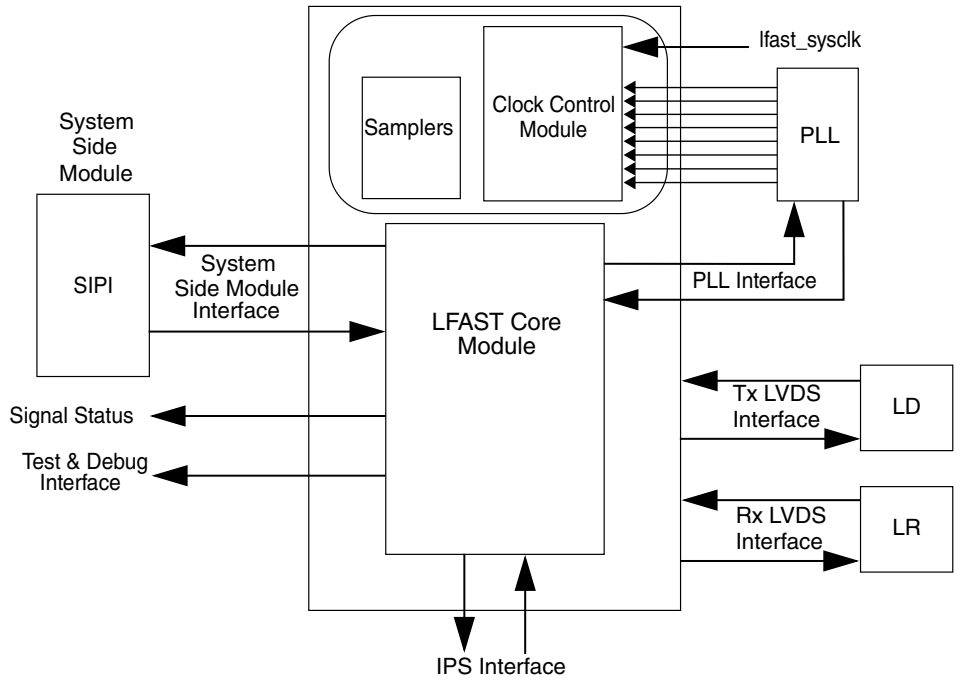

Figure 650. LFAST block diagram

83.2.2 Features

- Supports dual mode operation (register-configurable Master/Slave functionality).
- Supports asynchronous data transfer up to the maximum data rate shown in the product data sheet.
- Transmits and receives data, CTS, ICLC, and unsolicited frames.
- Provision of five interrupts for Tx and Rx channels.
- Supports processor - controlled transfer of ICLC frame with 8-bit payload size to implement the data rate changes and test modes.
- Supports LFAST - defined CTS - controlled data transfer. There is no dependency between data transmission and reception unless CTS mode is enabled.
- Supports flow control using sliding window protocol.
- Provides configurable frame length for data frame with variable payload sizes of 32, 64, 96, 128, 256, or 288 bits.
- Provides transmission of data frame length with 96 bits of payload size and reception of data frame with 128 bits of payload size.
- Provides configurable frame length for unsolicited frame with variable payload sizes of 8, 32, 64, 96, 128, 256, or 288 bits.
- Supports PLL configuration (for example, feedback loop divider, and so on.) through registers.
- Supports LVDS configuration through registers.
- Supports multiple loopback modes for checking the physical interface.
- Supports automatic ping response generation in slave mode.
- Supports for detection of unsupported channel number and unsupported payload size.

83.3 Functional description

This section provides a functional description of the LFAST.

83.3.1 Line receiver

This section describes the line receiver.

83.3.1.1 Introduction

The LR detects the voltage swing on the differential pair and converts it to a CMOS logic level that feeds the adaptive auto correlation block. The received data is sampled using the best of the eight (default) or four (alternative setting) possible sampling edges from the high speed clock or four phases using the low speed clock. The sampling edge is chosen by checking which of the 8/4 correlators provide the maximum correlation. If more than one sampling edge provides the maximum then the state machine will choose the sampling edge based on a defined selection algorithm.

After the correct sampling edge is chosen, the remaining unused sampling edges are turned off. Once the header is received the length of the frame (payload size) and logical channel definition can be obtained. The logical channel definition will determine the data type of the payload and therefore will determine the destination for the payload. Decoding of the ICLC commands from the payload is required in order to extract the interface control, rate mode,and PLL commands.

Figure 651 shows the block diagram of Uplink Controller.

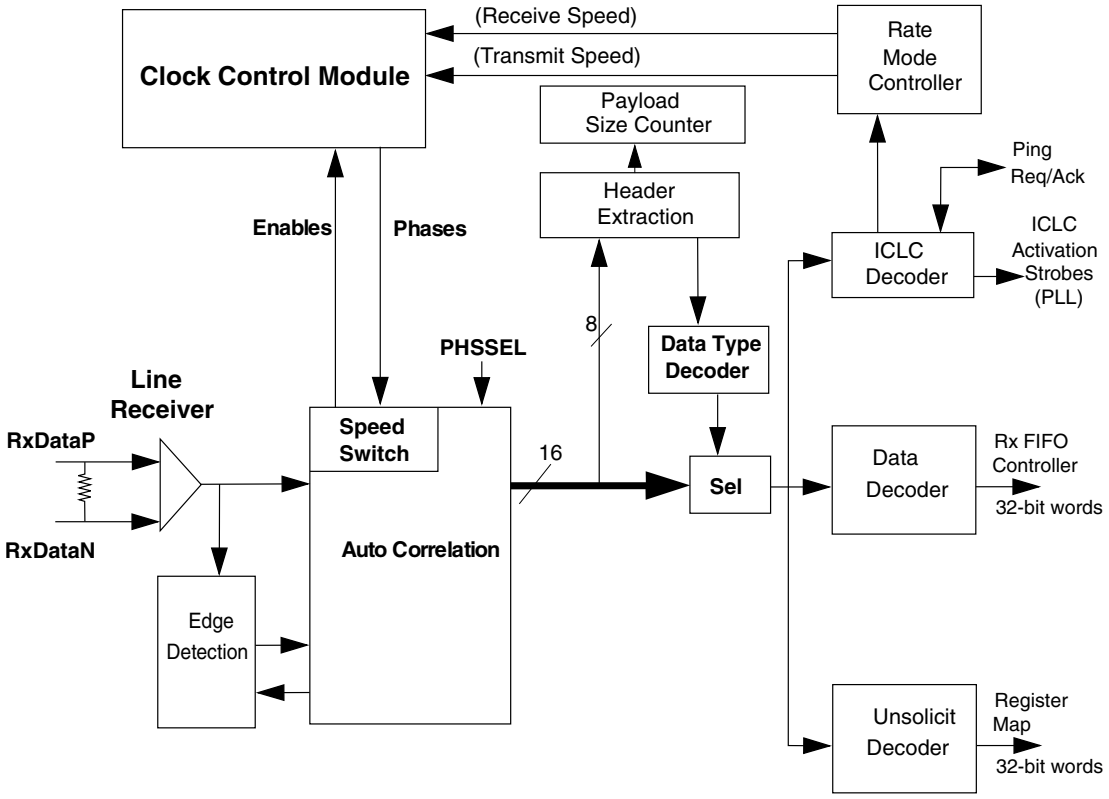

Figure 651. Top level receive controller

83.3.1.2 Edge detection and auto-correlation

The edge detection and auto correlation are described together, as the mode setting of the auto-correlation block impacts largely on whether the edge detection circuitry is used or not. The edge detection will be performed first if required before auto-correlation.

83.3.1.2.1 Auto-correlation modes

This section describes the auto-correlation modes.

83.3.1.2.1.1 Hunt correlation mode

On reset the Receive Controller will always come up in hunt correlation mode. In this mode all the correlators are enabled and the Receive Controller is always hunting for the synchronization pattern. The phase enables (either 8 or 4) to the external clock control module are always high. There is no edge detection for the first bit of the synchronization pattern. Hunt correlation mode is considered the safest mode as the Receive Controller is always checking for the synchronization pattern, but it is the mode that consumes the most power. In hunt correlation mode the correlation is performed over all 16 bits of the synchronization pattern.

Figure 652 shows the block diagram of Hunt correlation mode.

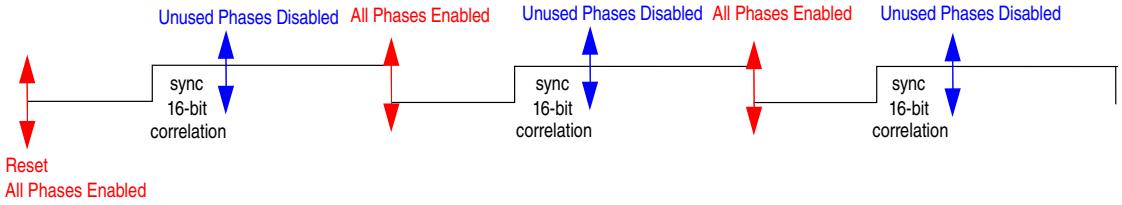

Figure 652. Hunt correlation mode

83.3.1.2.2 Edge detection

The edge detector is disabled in hunt correlation mode.

83.3.1.2.3 Auto correlation

The data transmission between the 2 devices LD and LR is asynchronous in nature. Hence the Receive Controller does not have the knowledge about the correct clock phase to be used for extracting the data. The task of the auto correlation (or synchronization) scheme is to estimate the best clock phase (8 or 4) for extraction of data as shown in the following figure.

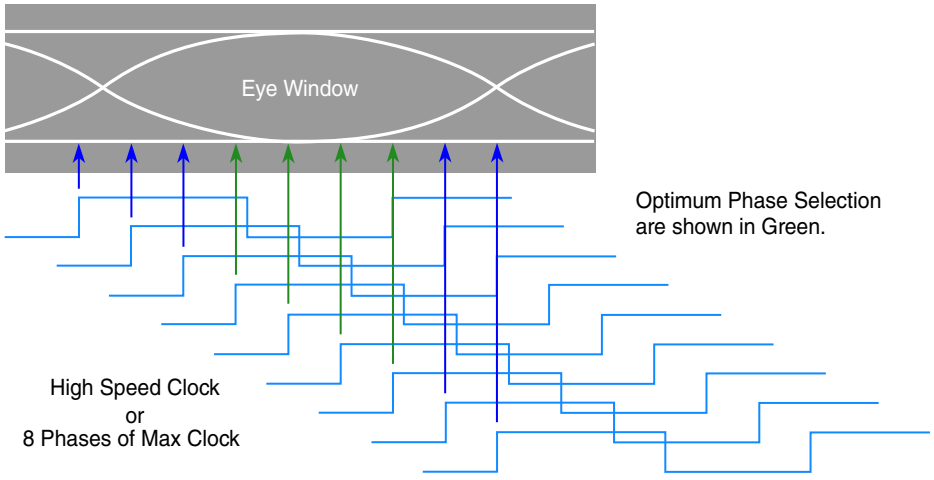

Figure 653. High speed 8 phase selection

The objective of the auto correlation is to select the clock phase that occurs closest to the center of the eye diagram window. For 8 Phase clock alignment the worst case selection is when the clock edge is just after the LR output transition. The 8 clock phases will sample the correct value but the middle clock phases are the ideal selection. If one of the middle phases are selected then the minimum distance to the LR transition is 3 clock phases as shown in the following figure.

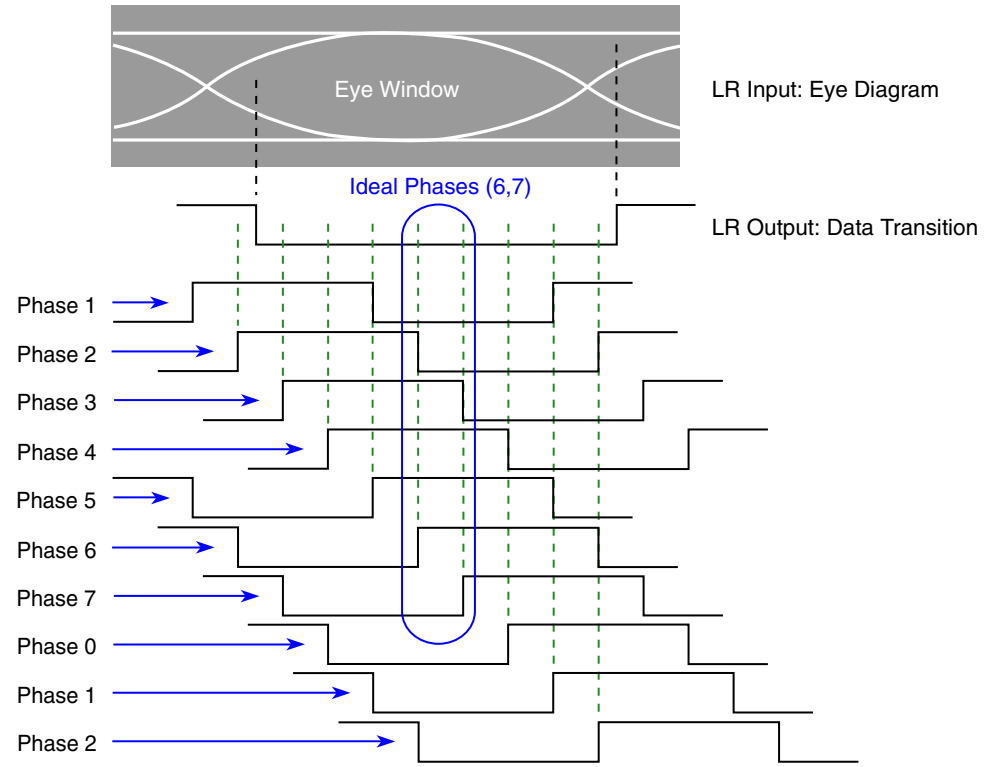

Figure 654. High speed 8 phase clock alignment example

Each of the 8 high speed phases are 45 degrees separated. For 4 phases, whether high or low speed, the phases are 90 degrees separated but can have different phases enabled as shown in Figure 655 and Figure 656.

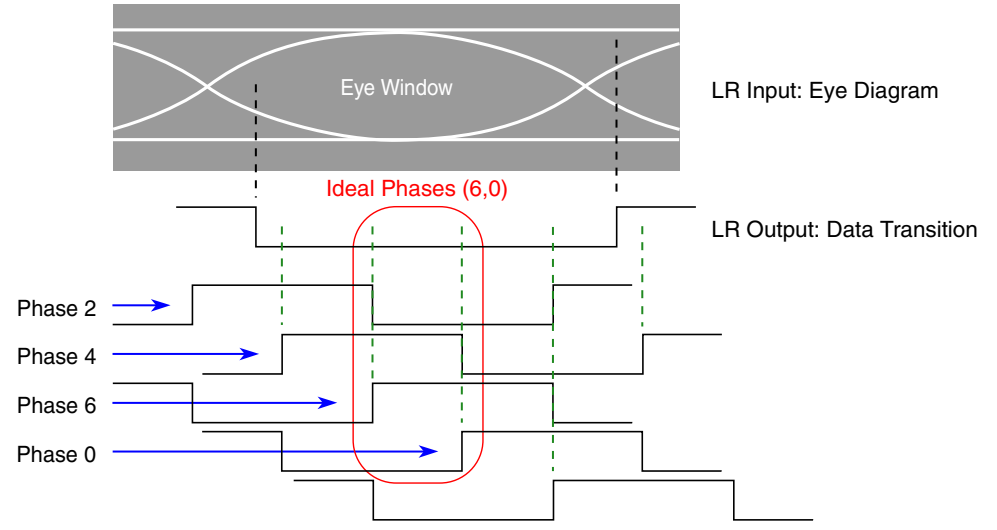

Figure 655. High speed 4 phase clock alignment example

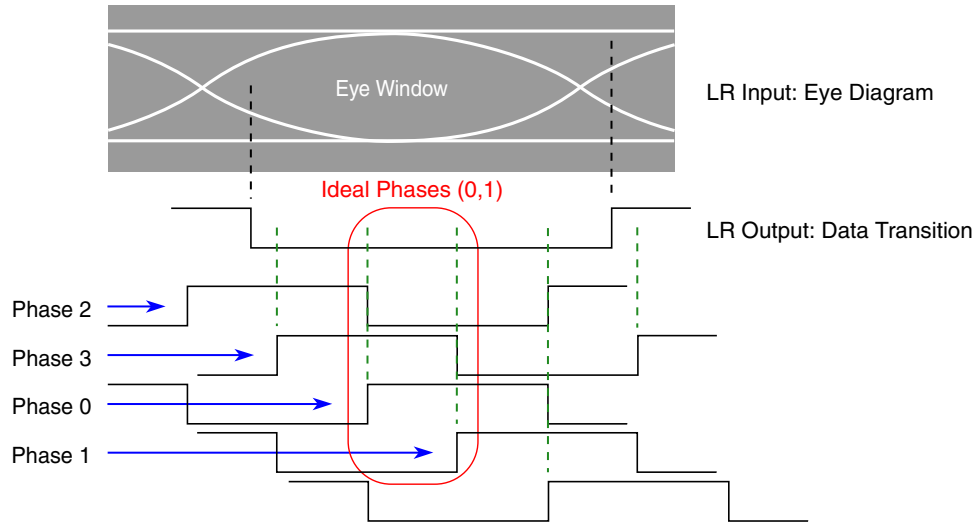

Figure 656. Low speed 4 phase clock alignment example

The auto correlation and selection of the correct clock phase starts after the edge detection finds a 0 to 1 transition. The high speed 8 or 4 phases from the PLL and the low speed 4 phases (generated inside the clocking module) are muxed inside the clocking module. The LFAST interface block will determine which phases are to be enabled and disabled. The only time the interface does not choose the phases is when the clocking module overrides the phase enables using COCR[SMPSEL].

The input data path can be sampled by different samplers depending on the configuration:

- High speed 8-phases: Samplers 0,1,2,3,4,5,6,7
- High speed 4-phases: Samplers 0,2,4,6
- Low speed 4-phases: Samplers 0,1,2,3

Each sampler block samples the data path with a different clock phase from the clocking module, and resamples it to a intermediate phase as shown in Table 739, Table 740, and Table 741 before resampling it to Phase 0. The intermediate phase is used to make static timing between the initial phase and the final phase 0. The final phase, Phase 0 is chosen so all the clock trees after the sampler are clocked by the same clock.

Table 739. High speed 8 phase selection - sampling procedure

Samplers	Initial sample	Intermediate sample	Final Sample
0	Phase 0	Phase 0	Phase 0
1	Phase 1	Phase 0	Phase 0
2	Phase 2	Phase 0	Phase 0
3	Phase 3	Phase 0	Phase 0
4	Phase 4	Phase 2	Phase 0
5	Phase 5	Phase 2	Phase 0
6	Phase 6	Phase 4	Phase 0
7	Phase 7	Phase 4	Phase 0

Table 740. High speed 4 phase selection - sampling procedure

Samplers	Initial sample phase	Intermediate sample phase	Final sample phase
0	Phase 0	Phase 0	Phase 0
1	Disabled	Disabled	Disabled
2	Phase 2	Phase 0	Phase 0
3	Disabled	Disabled	Disabled
4	Phase 4	Phase 2	Phase 0
5	Disabled	Disabled	Disabled
6	Phase 6	Phase 4	Phase 0
7	Disabled	Disabled	Disabled

For High speed 4 Phase selection, See Table 740, Samplers 1, 3, 5, 7 are disabled. In the Phase Select algorithm Phase 1 is mapped to Phase0, Phase 3 is mapped to Phase 2, Phase 5 is mapped to Phase 4, Phase 7 is mapped to Phase 6 so it simplifies the algorithm and allows the algorithm to be the same independent of 4 or 8 Phases in high speed.

Table 741. Low speed 4 phase selection - sampling procedure

Samplers	Initial sample phase	Intermediate sample phase	Final sample phase
0	Phase 0	Phase 0	Phase 0
1	Phase 1	Phase 0	Phase 0
2	Phase 2	Phase 0	Phase 0
3	Phase 3	Phase 0	Phase 0
4	Disabled	Disabled	Disabled
5	Disabled	Disabled	Disabled
6	Disabled	Disabled	Disabled
7	Disabled	Disabled	Disabled

For low speed 4 phase selection, See Table 741, Samplers 4, 5, 6, 7 are disabled. The first four samplers (0,1,2,3) of the low 4 phase speed selection algorithm are the same as the four samplers required for the high 8 phase speed. Therefore the same architecture can be used for both high speed and low speed with the other four data paths disabled for low speed.

83.3.1.2.4 Sampler block and phase enable and disable

There are 8 data sampler paths in total inside the auto correlation block, each data sampler has 3 sampling registers with the possibility of each register being clocked by a different phase (in example, Sampler 5 for high speed can have Phases 5, 2 and 0). Therefore, after the correct data sampler has been selected for either high or low speed, the block can turn off all the sampler paths except for one, therefore 3 out of 24 registers will remain enabled while the others are disabled, as shown in the following figure.

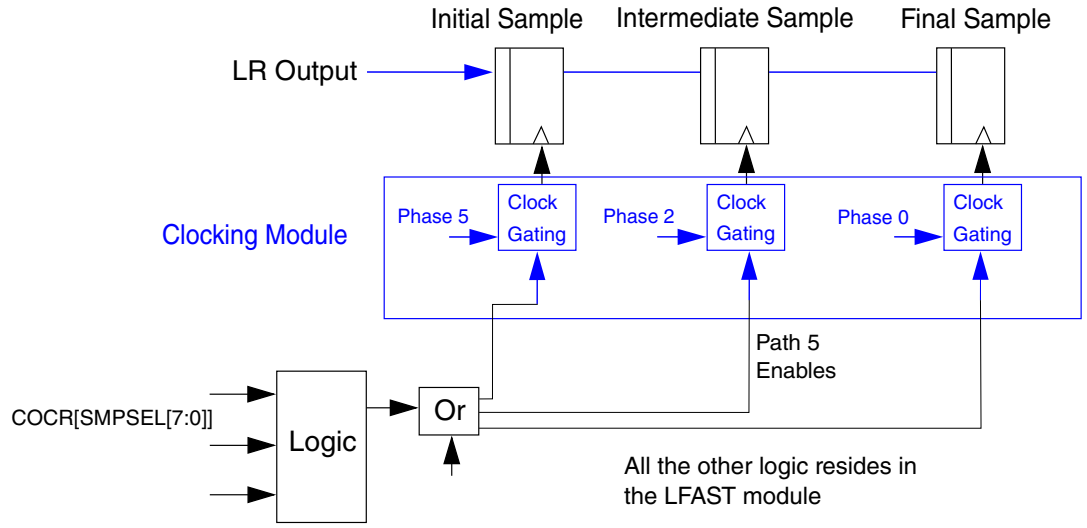

Figure 657. Sampler 5 logic

After correlation and the correct data sampler has been selected all the other data samplers whose initial phase does not match the select phase are disabled. The selected sampler will then keep the required phases needed enabled, this can be max 3 phases (for example, Sampler 5 has Phases 5, 2, 0) or min 1 phase (in example below, Sampler 0 has all Phase 0 content).

The end result is that the Rx Controller can disable the required number of unused sampler registers and disable any unnecessary phases from the clocking module by deasserting the respective phase enables.

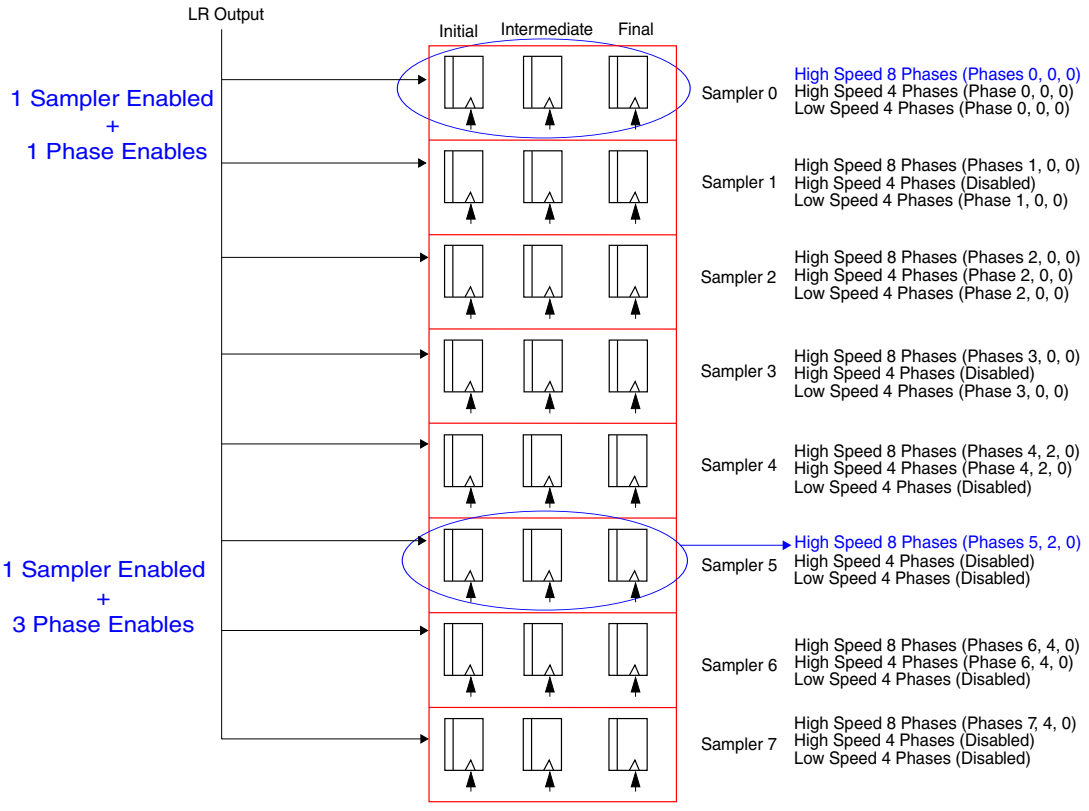

Figure 658. 8 Samplers, each sampler has 3 registers

In order to achieve the sampler and phase enable requirements each Sampler block will require the logic as shown in the following figure.

The Clock gating element resides inside the clocking module block. The interface will provide the enables to the clocking module and the clocking module will in return provide the individual clocks to the sampling registers.

83.3.1.3 Header and payload extraction

Once the Phases/Samplers are chosen after synchronization and correlation the next part of the flow is the header extraction. The Receive Controller will output a 16 bit word, bit shifted every Phase 0 clock as shown in the Figure 659.

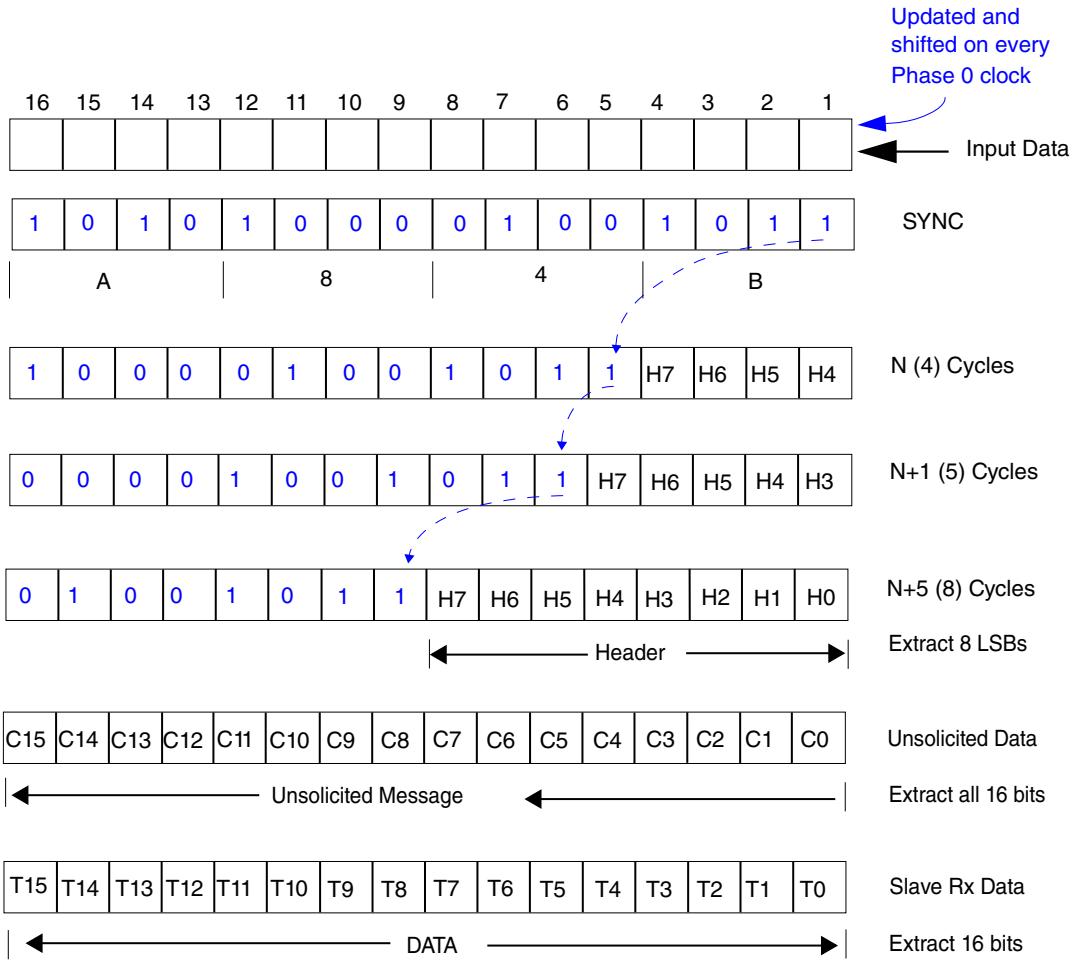

Figure 659. Extracting header and payload from the 16-bit output from auto correlation.

83.3.2 Transmit controller

This section describes the transmit controller.

83.3.2.1 Introduction

The transmit controller uses Rx information, status information and error control data and codes them into the appropriate frame structure for transmission to the LD. This includes the synchronization and header, in preparation for the LD, which transmits the frame to peer LFAST IC at either low or high speed. The transmit controller creates a frame structure that is converted to a serial format for the LD.

An arbitration block will determine which message has higher priority data, unsolicited, ICLC, CTS, ping, and so on. The data frames are extracted from the FIFO controller, the unsolicited message from the register block, the CTS messages from the receive controller and the ping response from the register block.

The Tx interface has two speed modes:

- Low speed
- Fast speed

The transmit controller consists of the following blocks as shown in the following figure.

- Arbitrator
- Framer
- Request Clock Control

The arbitrator will grant access to the framer from the request that has the highest priority. The framer block will extract the payload data from the granted request source and build the frame (adding synchronization or header if required). The frame is fed into a Parallel In Serial Out (PISO) and eventually sent to the LD.

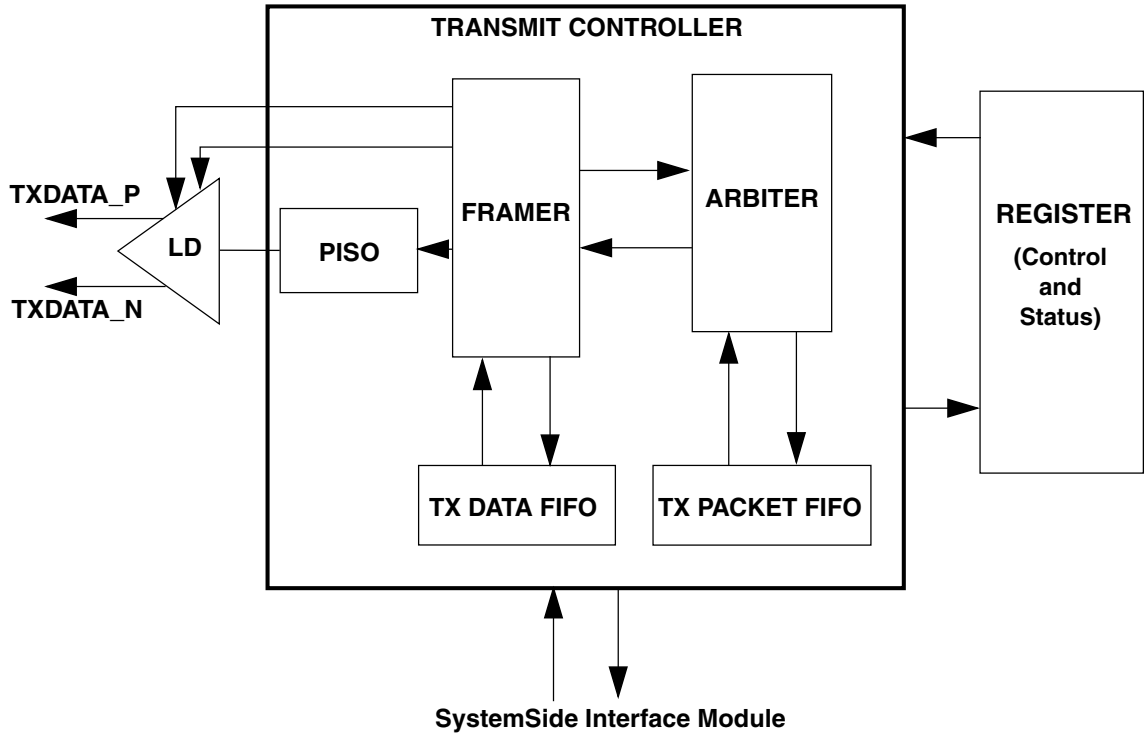

Figure 660. Transmit controller connections

83.3.2.2 Arbitration

The arbitration block prioritizes between requests from multiple sources like

- S/W programmable registers
- System side interface FIFO
- Rx interface controller

The level of priority for each request is shown in Table 742

Table 742. Priority levels for the transmit controller

Request	LFAST master priority	LFAST slave priority	Triggering conditions *(at least one of the listed)*
LFAST interface enable	1	1	• LFAST interface enable is asserted • LFAST interface enable is negated
Tx Interface disabled	2	2	• MCR[DRFEN] = 0 • MCR[TXEN] = 0 • MCR[DRFRST] = 1 • MCR[TXARBD] = 1 • LFAST Slave: ICLC frame with payload for "Disable Rx interface" received
Tx Interface speedmode change	3	3	• SCR[TDR] is modified • LFAST Slave: ICLC frame with payload for changing Rx interface speed received
Loopback frame in Loopback mode	4	4	• TMCR[LPON] = 1Dig • RF Slave: ICLC frame with payload for loopback mode enable received **NOTE** Valid only for following TMCR[LPMOD] settings: LPMOD[2:0] = 011b LPMOD[2:0] = 100b
ICLC frame request	5	-	• LFAST Master: ICR[SNDICLC] = 1 • LFAST Master: ICR[ICLCSEQ] = 1
Ping response request	-	5	• LFAST Slave: ICLC frame with payload for ping request received and PICR[PNGAUTO] = 1 • LFAST Slave: PICR[PNGREQ] = 1
Unsolicited frame request	6	6	• Last Frame with CTS = 1 received from the peer LFAST device • UNSTCR[USNDRQ] = 1
Data frame from Tx FIFO	7	7	• Tx FIFO contains one or more frames • Last Frame with CTS = 1 received from the peer LFAST device • MCR[DATAEN] = 1
CTSFrame	8	8	• MCR[CTSEN] = 1

Table continues on the next page...

Table 742. Priority levels for the transmit controller (continued)

Request	LFAST master priority	LFAST slave priority	Triggering conditions *(at least one of the listed)*
			• Rx FIFO reaches High/Low threshold, defined by TISR and no frame pending
Clock mode test	9	9	• TMCR[CLKTST] = 0 • LFAST Slave: ICLC frame with payload for clock test mode enable received

Once the arbitrator has granted access to a request, the framer will commence building the frame. Any new requests for frame or data rate change will not be granted access until the framer has finished transmitting the current frame. If a data rate change request for the Tx interface is received while the transmit controller is in the middle of sending a frame then the rate change request to the clocking module will be delayed. This allows for the frame to be completed before the change in speed mode. This prevents any speed mode change during the transmission of a frame. Once the speed mode request is sent to the clocking module by the Tx interface controller, it will then not allow any new requests to be processed for a specific time period defined by the bit field RCDCR[DRCNT].

83.3.2.3 Line Driver digital connections

83.3.2.3.1 Line driver states

The LD has the following states:

- Shutdown

  The LD enters the shutdown state when the LD powerdown signal and the output buffer enable is high. In this state, the LD regulator is not supplying power and the LD outputs are connected to ground. Once LD powerdown signal is negated, a settling time is required before the LD may be used for communication.

- Sleep

  The LD enters in sleep state when the signal is asserted. In this state, the LD is enabled, but held in a power-saving state. Sleep mode may be used during inter-frame gaps that are long compared to the frame durations but not long enough to allow the interface(s) or high-speed clock generators to be powered down completely. In the sleep state the LD outputs are connected to Vcm (common mode voltage). To exit from sleep mode the LD sleep signal is negated. The LD is required to transmit a logic 0 level on the interface for a pre-defined minimum time. The minimum time is the summation of settling time of LD after negation of LD sleep signaland the wakeup time of the LR on the other side.

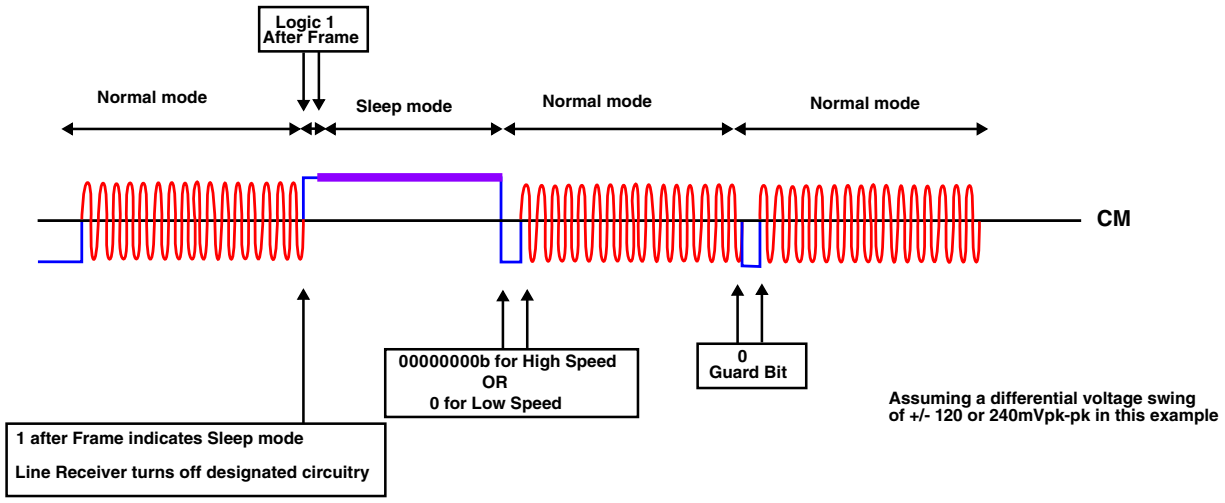

Figure 661. Example of sleep mode

As shown in Figure 661 before every normal mode burst on the txdatap line there is one guard bit period (minimum inter-frame gap) where a logic 0 will be transmitted.

- Normal

  In the normal state the LD is primed for transmission. The LD shall drive the interface as dictated by the input data bit that is supplied by a shift register under the control of a finite state machine. If the LD is not enabled, and the framer is activated, and has a frame to transmit, an interrupt (TISR[TXIEF]) will be generated. The LD moves back to the shutdown state when the LFAST master sends an ICLC Rx data off command.

Table 743. Line driver states

LD state	LFAST master triggers	LFAST slave triggers
Shutdown	• Programing LCR[SWOFFLD] and LCR[SWONLD] • Programing MCR[TXEN] and MCR[DRFEN]	• LFAST interface enable negation/assertion • Programing LCR[SWOFFLD] and LCR[SWONLD] • ICLC command from LFAST master • Programing MCR[TXEN] and MCR[DRFEN]
Sleep	• Programing LCR[SWSLPLD] and LCR[SWWKLD]	• No pending frame for transmission • Programing LCR[SWSLPLD] and LCR[SWWKLD]
Normal	Absence of above mentioned conditions	Absence of above mentioned conditions

83.3.3 CTS mode support

LFAST module supports flow control methods. The CTS is a protocol defined method to ensure no loss of frame, due to Rx FIFO unavailability. The optimal use of bandwidth of LFAST, without losing frames, is ensured by proper programing of the Rx FIFO Lower threshold (RFCR[CTSMN]) and higher threshold (RFCR[CTSMX]). The CTS is supported by both the LFAST Master and Slave.

CTS transmission:

The LFAST device sends CTS information with each frame to the peer LFAST device.

If the CTS mode is enabled by write MCR[CTSEN] = 1 then:

- Sends CTS bit as 0 in LFAST frame (bit[0] of header field) whenever the Rx FIFO reaches the higher threshold defined by the bitfield TISR[CTSMX]. This indicates that the LFAST device doesn't want the peer device to send data. The CTS bit of all frame are sent 0 until the Rx FIFO pointer reaches the lower threshold, as described below.
- Sends CTS bit as 1 in LFAST frame (bit[0] of header field) whenever the Rx FIFO reaches the lower threshold defined by the bitfield TISR[CTSMN]. This indicates that the LFAST device is ready to receive data from the peer device. The CTS bit of all frame are sent 1 until the Rx FIFO pointer reaches the higher threshold, as described above.
- The CTS bit can be sent through any type of frame (data, unsolicited, or ICLC). When there are no frames available in LFAST to send to the peer device, a CTS frame is sent. In this frame, bit[4-1] of header field are sent as 0011b and 8-bit payload of 0.

If the CTS mode is not enabled (for example, bit MCR[CTSEN] = 0) then:

- All the frame sent will have CTS bit as 1 in LFAST frame (bit[0] of Header field).

CTS reception:

The reception of a LFAST frame with CTS bit 0 indicates that the peer device is not ready to receive data frames. The transmission of all pending data and unsolicited frames are postponed until a frame with CTS bit 1 is received.

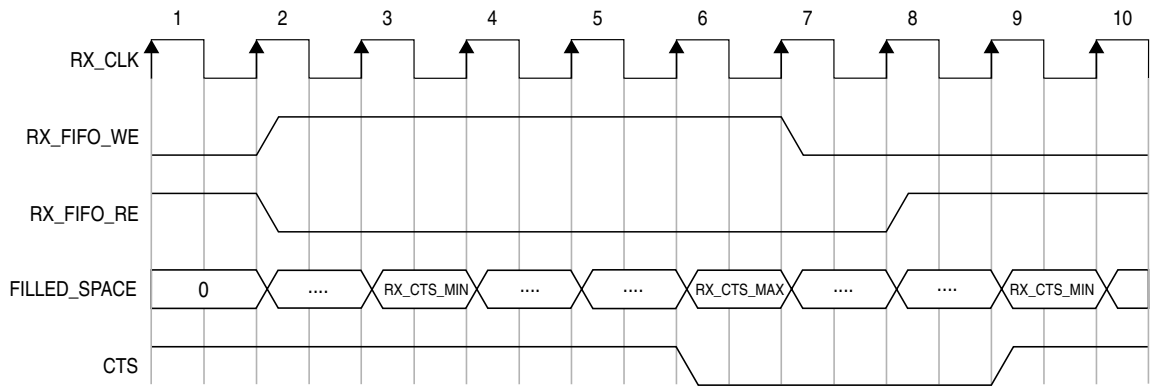

Figure 662. CTS generation

83.3.4 LFAST frame structure

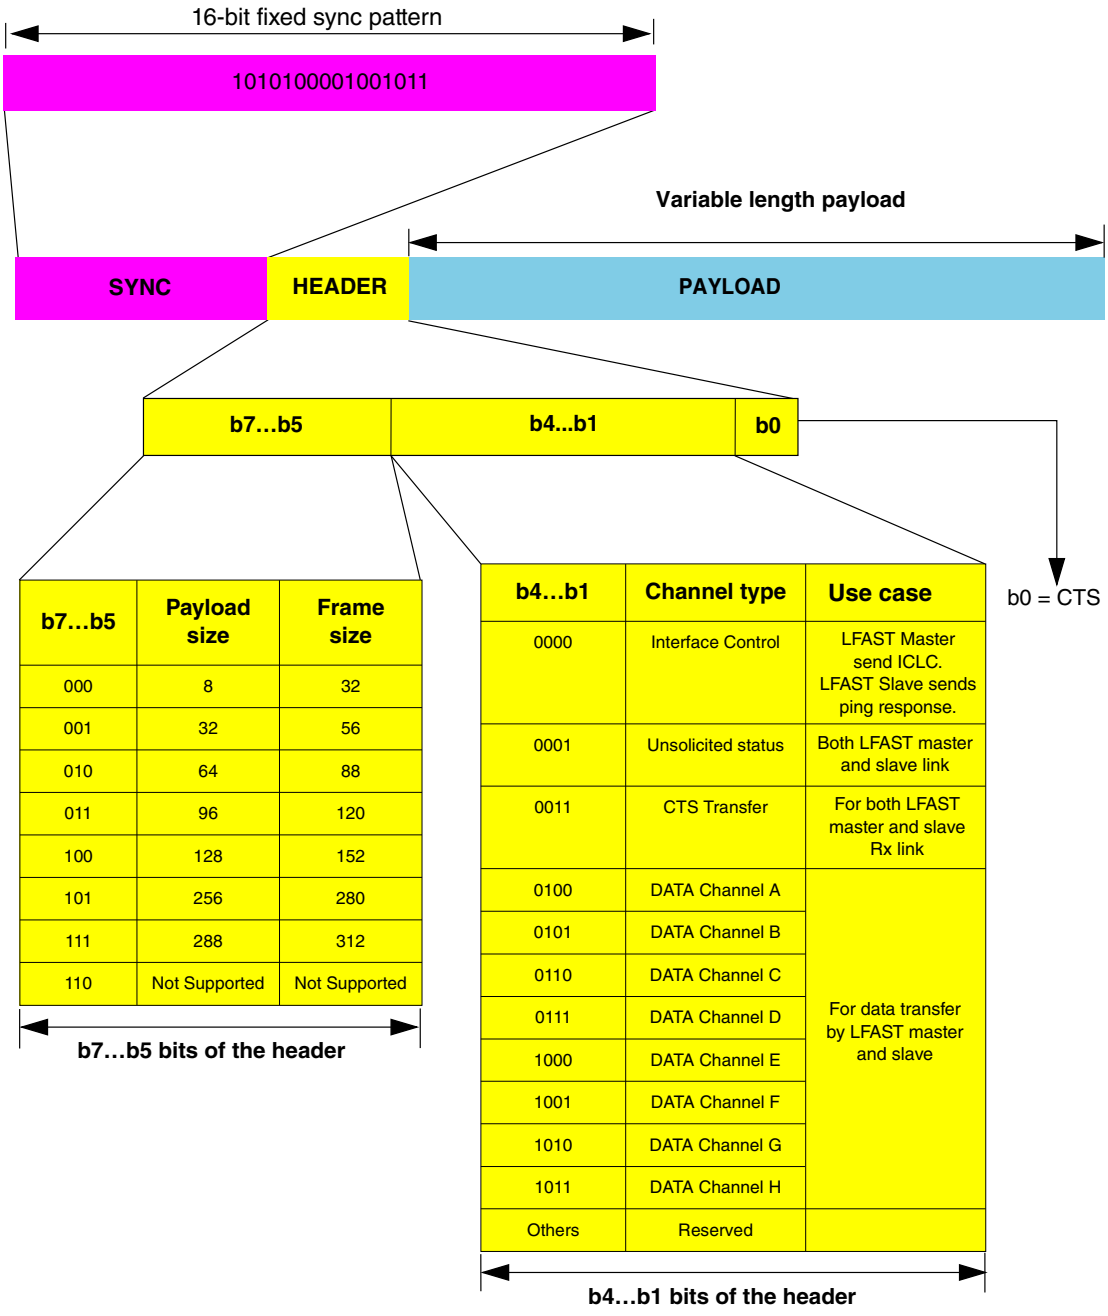
An LFAST frame is made up of three fields:

- Sync pattern
- Header
- Payload

Sync pattern and header fields are of fixed length.

Sync pattern is used to synchronize an incoming data stream in LFAST module.

The header field of the frame distinguishes various types of data and control transferred and also contains information about the length of the payload. The payload field is the actual data that is transferred across the channel. See Figure 663 for details of the LFAST frame.



b7…b5	Payload size	Frame size
000	8	32
001	32	56
010	64	88
011	96	120
100	128	152
101	256	280
111	288	312
110	Not Supported	Not Supported

b4…b1	Channel type	Use case
0000	Interface Control	LFAST Master send ICLC. LFAST Slave sends ping response.
0001	Unsolicited status	Both LFAST master and slave link
0011	CTS Transfer	For both LFAST master and slave Rx link
0100	DATA Channel A	For data transfer by LFAST master and slave
0101	DATA Channel B	
0110	DATA Channel C	
0111	DATA Channel D	
1000	DATA Channel E	
1001	DATA Channel F	
1010	DATA Channel G	
1011	DATA Channel H	
Others	Reserved	

Figure 663. LFAST frame structure

The same protocol is used on both transmit and receive interfaces for communicating data, control, and status information. A synchronization pattern (16 bits) and header (8 bits) are present in every frame.

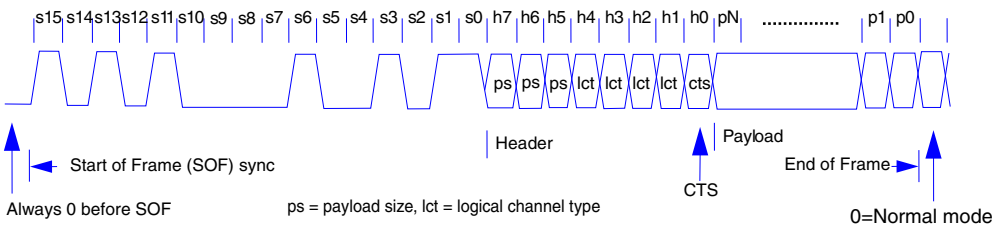


Figure 664. Serial frame structure

The frame structure is shown in Figure 664 and consists of the following:

- **16-bit synchronization pattern:** Used for clock synchronization and pattern recognition. The frame synchronization code at the start of every frame is a unique reserved word that is used to identify whether the data received is the start of the frame and for synchronization (clock phase extraction) with the stream data. A synchronous sequence is used to give a high quality auto correlation. The LFAST 16-bit synchronization sequence = 1010_1000_0100_1011b = A84Bh.
- **Header - 3 MSB (b7 - b5):** Defines the payload size as shown in Table 744:

Table 744. Header payload sizes

b7-b5(bin)	Payload size	Frame size
000	8	32
001	32	56
010	64	88
011	96	120
100	128	152
101	256	280
110	—	—
111	288	312

- **Header - (b4 - b1):** Defines the logical channel types, which indicate the type of payload that the frame carries. How the payload field of a frame is used for any other logical channel type is system side module specific except in the case of the interface control logical channel type and Clear To Send (CTS) frame.
- **Header - (b0):** CTS on the both LFAST master and slave devices.
- **Payload:** Content dependent upon frame type.
- **Bit after frame:** This bit determines entry into Sleep mode (1 = Sleep mode, 0 = normal mode)

83.3.5 Frames supported

Table 745 provides the frames supported and their permissible payload sizes

Table 745. Frames supported by LFAST interfaces

Frame type	LCT code	Supported by 1. LFAST master Tx2. LFAST slave Rx	Supported by1. LFAST slave Tx2. LFAST master Rx	Payload size (bits)
Data Frame	0100b – 1011b	YES	YES	32, 64, 96, 128, 256, 288
Unsolicited Frame	0001b	YES	YES	8, 32, 64, 96, 128, 256 and 288
ICLC Frame	0000b	YES	NO[1]	8
CTS Frame	0011b	YES	YES	8
Reserved	All others	—	—	—

1. Except the ICLC PING response frame.

If logical channel type (LCT) code other than the above mentioned are received then the interrupt flag RISR[RXLCEF] = 1. If the payload size received does not match any value in Table 745 then the flag RISR[RXSZF] = 1. In both these error conditions the received frame is ignored. The S/W may have to take the necessary steps to recover from such an error.

83.3.6 Frame flow

Following sections describe data frame flow, ICLC flow and Rx unsolicited data flow.

83.3.6.1 Data flow

LFAST supports the transfer of data between master and slave LFAST devices.

83.3.6.1.1 Data transmit

System side module is the initiator of all the Tx data frame to LFAST peer device. Data frame transmit is triggered whenever the Tx Data FIFO has at least one valid frame. The MCR[DATAEN], MCR[DRFEN] and MCR[TXEN] bits, should be set to enable the transfer of Tx data.

If MCR[DATAEN] = 0, then the valid frames in the in Tx data FIFO will be ignored for transmission. The payload size and channel type of each frame is specified by the system side module interface during transfer of the frame to the LFAST interface. The frame header is stored in the Tx packet FIFO and the payload in the Tx data FIFO.Whenever the Tx FIFO has at least one frame then a data transmit request is made to the Tx arbiter of the LFAST. Tx block arbitrates the data transmit request and schedules it depending on the priority of all the pending transmit requests. When data request is scheduled by Tx block, the required data is fetched from Tx data FIFO. The number of frames present in the Tx FIFO for transmission is indicated by the bitfield DFSR[TXFCNT].

83.3.6.1.1.1 Programing model for Tx data transmit

1. Program MCR[DATAEN] = 1, MCR[TXEN] = 1 and MCR[DRFEN] = 1 to enable the Tx path of LFAST device
2. Select the desired clock rate at which data should be transmitted, using ICLC transfers and appropriate programing of SCR[TDR] bits.
3. Frame present in TX FIFO (Data and Packet FIFO) are sent.
4. TISR[TXDTF] = 1 after each frame transfer
5. CTS is set depending on the push/pull mode setting defined by MCR[CTSEN].

83.3.6.1.2 Data receive

LFAST master and slave supports reception of data frame. The received frame is determined to be of data frame type by decoding channel type field of the header present in the received frame. The MCR[DATAEN], MCR[RXEN] and MCR[DRFEN] bits should be set to enable the data frame reception. When MCR[DATAEN] = 0 the received data frames will be ignored and will not be placed in the Rx data FIFO.

The Rx data frames received by Rx block are stored in the Rx FIFO. Whenever the frame is received in the Rx FIFO the system side module is indicated by assertion of LFAST Rx FIFO ready signal. The frame size and the channel type is passed to the LFAST. The frame boundaries are indicated by start of frame and end of frame signals. The number of unread frames in the Rx Data FIFO are indicated by DFSR[RXFCNT]. When Rx DATA FIFO is full and cannot accommodate current frame completely, then the remaining data of the Rx frame is discarded. In this case, UNSRSR[RXOF] = 1 and an interrupt is generated if the RIER[RXOFIE] = 1.

83.3.6.2 Unsolicited flow

83.3.6.2.1 Unsolicited frame transmit flow

The S/W is the initiator for unsolicited frames to the LFAST peer device. The unsolicited frame header and payload is programed into the unsolicited data and control registers. Once the payload is programed UNSTCR[USNDRQ] is set, generating a request for unsolicited frame transfer to the Tx arbiter.

83.3.6.2.1.1 Programing model for unsolicited frame transmit

1. Program MCR[TXEN] = 1 and MCR[DRFEN] = 1 in the Mode Configuration Register (MCR) to enable the Tx path
2. Select the desired clock rate at which data should be transmitted, using ICLC transfers and appropriate programing of SCR[TDR].
3. Read the UNSTCR[USNDRQ].
   - If UNSTCR[USNDRQ] = 1 then wait for either of the following:
     - UNSTCR[USNDRQ] = 0
     - TISR[TXUNSF] = 1
   - If UNSTCR[USNDRQ] = 0 then:
     - Program the unsolicited payload in UNSTDR0–UNSTDR8, and can be written up to a payload of frame of a maximum of 288 bits.
     - Program the unsolicited frame header in UNSTCR[UNSHDR].
     - Program UNSTCR[USNDRQ] = 1.
4. UNSTCR[USNDRQ] is cleared by the Tx block after the frame transfer.
5. TISR[TXUNSF] = 1 when the frame is transmitted.
6. CTS is set depending on the Push-Pull mode setting defined by MCR[CTSEN].

83.3.6.2.2 Unsolicited frame receive flow

Whenever an Unsolicited frame is received from the peer device, the following steps are performed:

If UNSRSR[URXDV] = 0 then:

1. The payload size field of the header is first saved into the UNSRSR[URPCNT].
2. The payload is stored in the UNSTDR0–UNSTDR8.
3. UNSRSR[URXDV] = 1 and the RISR[RXUNSF] = 1 indicating the successful reception of the frame.

If UNSRSR[URXDV] = 1 then:

1. The current unsolicited frame is ignored.
2. RISR[RXUOF] = 1.

Typical steps by the processor after RISR[RXUNSF] = 1 is as follows:

1. The processor reads UNSRSR to get the payload size of the frame.
2. It then reads the complete frame by reading UNSRDR8–UNSRDR0 for the payload size as received in the frame.
3. Then it clears the interrupt (write RISR[RXUNSF] = 1) and also the UNSRSR[URXDV] bit.

83.3.6.3 ICLC flow

The Interface Control Logical Channel (ICLC) is a separate logical channel type, which is mainly meant for implementing the data rate change in the LFAST interface and initiating the test modes.

83.3.6.3.1 ICLC data transmit flow

Whenever the processor intends to transfer an ICLC frame to the LFAST slave then the following steps are to be followed.

1. Write the ICLC frame payload in the ICR[ICLCPLD] (see Table 746 for payloads as defined by the standard).
2. Program ICR[SNDICLC] = 1 to initiate the ICLC frame transfer. This bit clears itself when the ICLC frame has been transmitted. The processor needs to poll this bit to make sure it is cleared before setting this bit again (even when ICR[ICLCSEQ] = 1).
3. TISR[TXICLCF] = 1 after the transfer of the ICLC frame.
4. CTS is set depending on the Push-Pull mode setting defined by MCR[CTSEN].

To determine whether the ICLC frame has been sent or not, either the ICR[SNDICLC] bit can be polled, or wait for TISR[TXICLCF] = 1.

Table 746. Supported ICLC payloads

ICLC code(hex)	ICLC function
00	Ping Request from LFAST Master to LFAST Slave
01	Reserved
02	Start PLLIn preparation for High Speed mode
04	Stop PLL Fallback to low speed mode
08	Select RxData Slow (LFAST Slave Rx Interface)
10	Select RxData Fast (LFAST Slave Rx Interface)
20	Select TxData Slow (LFAST Slave Tx Interface)
40	Not Supported
80	Select TxData Fast (LFAST Slave Tx Interface)
31	Enable TxData Interface (LFAST Slave Tx Interface)
32	Disable TxData Interface (LFAST Slave Tx Interface)

Table continues on the next page...

Table 746. Supported ICLC payloads (continued)

ICLC code(hex)	ICLC function
34	Clock Test mode Send 101010… continuously using the currently configured clock rate (slow, fast);
FF	Turn payload loopback on
38	Turn Test mode (Loopback and Clock Test) off

Programing model for ICLC frame transmit:

1. Set the ICR[ICLCSEQ] bit (optional).
2. Write the ICLC frame payload in the ICR[ICLCPLD], corresponding to the desired Tx/Rx data rate change, as described in the Table 746.
3. Write ICR[SNDICLC] = 1 to initiate the ICLC frame transfer.
4. LFAST master will schedule the ICLC transfer. Data present in ICR[ICLCPLD] is transmitted to the LFAST slave at the old Tx data rate. LFAST slave will configure its Tx/Rx interface data rate accordingly.
5. Reset the ICR[ICLCSEQ] to allow the scheduling of other types of frames, which will be sent at the new data rate.

When ICR[ICLCSEQ] = 0, though the ICLC frame transfer still has highest arbitration priority, other frames may be scheduled if no valid ICLC frame request exist.

NOTE

ICLC frame transmit will not trigger the internal data rate change of LFAST master Tx/Rx interface. LFAST master Tx/Rx interface data rate will only be changed, when corresponding SCR[TDR] and SCR[RDR] bits are appropriately configured.

Processor requires to take care that no data frames are to be transmitted while data rate change is happening or ICLC is transmitting frames by setting ICR[ICLCSEQ] bit in Table 746.

83.3.6.3.2 ICLC data receive flow

When the bits 4 to 1 of a receive frame are 0000b it indicates that the payload is an ICLC. ICLC payloads are always 8 bits.

The reception of an ICLC frame is indicated by an interrupt to the system. The ICLC status register RISR indicates the type of the ICLC frame received. The Rx block will decode and generate the appropriate signals. An invalid ICLC code besides the ones listed in Table 746 will cause RISR[RXICF] = 1.

83.3.6.3.2.1 Ping request ICLC

The LFAST slaves ICLC decoder will decode the ping request and set RIISR[ICPRF]. The S/W can also write to PICR[PNGREQ] to indicate to the Tx block that a ping response frame needs to be transmitted. The PICR[PNGAUTO] indicates whether Tx block can respond automatically to the request by the LFAST master ICLC ping request frame. The Tx block will arbitrate the ping response frame request and send a ping frame with ping data defined by bitfield PICR[PNGPLYD]. Once the ping response frame has been sent the Tx block will set TISR[TXPNGF] and clear PICR[PNGREQ], if set.

83.3.6.3.2.2 LFAST slaves RxData interface slow/fast ICLC

The LFAST slaves Rx Interface has two speed modes supported: slow (low speed) and fast (high speed). The ICLC command will write RIISR[ICRSF] = 1 (low speed) or RIISR[ICRFF] = 1 (high speed).

83.3.6.3.2.3 LFAST slaves TxData interface slow/fast ICLC

The LFAST slaves Tx interface controller has two speed modes: slow (low speed), and fast (high speed). The ICLC command will write RIISR[ICTSF] = 1 (low speed) or RIISR[ICTFF] = 1 (high speed).

83.3.6.3.2.4 Enable/disable LFAST slaves TxData interface ICLC

The ICLC commands, enable RxData interface and disable RxData interface are decoded and the appropriate enable/disable signal sent to the Tx block Controller. These ICLC command writes RIISR[ICTEF] = 1 and RIISR[ICTDF] = 1. The ICLC Tx enable command will write MCR[TXEN] = 1.

No frames can be sent on the LFAST slave Tx interface until the either LFAST master has enabled it via an ICLC frame or S/W programs MCR[TXEN] = 1.

83.3.6.3.2.5 Clock test mode ICLC

This ICLC command is decoded, and then is used to write TMCR[CLKTST] = 1. This indicates to the Tx interface to output an alternating pattern of 1 and 0 at the currently configured clock rate. The Rx interface generates RIISR[ICCTF] = 1 on reception of this ICLC command.

The exit from this mode happens on reception of test mode off ICLC command.

83.3.6.3.2.6 Loopback payload on ICLC

This ICLC command is decoded and TMCR[LPON] = 1 to indicate to the Tx Block that the received payload is to be sent back. The exit from this mode happens on reception of Test mode off ICLC command. The Rx interface causes RIISR[ICLPF] = 1 on reception of this ICLC command.

83.3.6.3.2.7 Test mode off ICLC

This ICLC command is decoded and TMCR[LPON] and TMCR[CLKTST] are cleared to indicate to the Tx block to exit from loopback mode or clock test mode.

Another option is for the payload loopback option to remain enabled until negated on the toggling of LFAST interface enable.

83.3.6.3.2.8 Ping response ICLC

The LFAST master considers any ICLC frame payload as ping response data. The LFAST masters Rx block will store the received ping data in PISR[RXPNGD] and match it with PICR[PNGPYLD]. RIISR[ICPSF] = 1 if the ping received matches with the one stored in PICR[PNGPYLD], or RIISR[ICPFF] = 1.

83.3.6.4 CTS flow

83.3.6.4.1 CTS Tx flow

The CTS frame, if enabled by the S/W, indicates the status of the receive data FIFO. CTS frame is triggered whenever Rx Data FIFO reaches either the high/low threshold and no data, ICLC or unsolicited frame is ready for transmission.

Programing model for CTS frame transmit:

- Program RFCR[CTSMX] and RFCR[CTSMN].
- Enable the CTS frame transmission by programming MCR[CTSEN] = 1.
- Program MCR[TXEN] = 1 and MCR[DRFEN] = 1 to enable the Tx path.
- The CTS bit sent with a valid frame (for example, data, ICLC, and unsolicited) is 1 until the Rx data FIFO reaches high threshold.
- When the Rx Data FIFO reaches higher threshold and no valid frame (data, ICLC, and unsolicited) is pending for transmission, then the CTS frame is triggered, with CTS bit of header = 0 and the status bit RISR[RXMXF] = 1.

- When the Rx data FIFO reaches low threshold, due to system side reads and no valid frame (data, ICLC, and unsolicited) is pending for transmission, then the CTS frame is triggered, with CTS bit of header = 1, and status bit RISR[RXMNF] = 1.

83.3.6.4.2 CTS Rx flow

Whenever a CTS frame header or any other frame with valid header is received with CTS bit = 0, then RISR[RXCTSF] = 1. The Tx Interface arbitration for unsolicited frame and data frame transmit request is turned off on reception of frame with CTS bit 0. The arbitration for unsolicited frame and data frame is enabled on reception of frame with CTS bit 1. Frame with LCT type CTS are not stored in the LFAST.

83.3.7 Test and debug support

The test and debug interface helps to debug the LFAST module. These signals can be brought out for ease of validation.

83.3.7.1 Loopback test mode

The loopback function allows to verify the correct operation of the physical interface and the basic checks for the LFAST module without a peer device.

There are certain prerequisites before entering the Loopback mode:

- LD and LR should be turned on.
- Tx and Rx mode should be enabled.
- Interrupts needed for S/W should be enabled.
- Both Tx and Rx interface should be in same speed mode.
- For automatic test mode TMCR[LPFRMTH] should be programed.

The LFAST module supports four loopback modes, defined by TMCR[LPMOD].

Table 747. Loopback modes

LPMOD[2:0]	Mode selected
000	Rx Loopback (default)
001	Rx LVDS Loopback
010	Tx Loopback without Automatic frame generation
011	Tx Loopback with Automatic frame generation
100	Tx LVDS Loopback (external) with Automatic frame generation

The TMCR[LPON] bit controls the state of the loopback function, and the default setting is 0 (off). This can be written by S/W, or in the case of the LFAST slave, the TMCR[LPON] bit can be modified by the Rx interface controller on decoding of a valid ICLC loopback on or test mode off commands. The LPMOD should not be changed when the LPON bit is set.

In all loopback modes, except Tx loopback without automatic frame generation, the decoding of frame and error flags is stopped. Only decoding of following is done:

- ICLC turn test mode off frame.
- CTS bit of all frames.
- Automatic loopback frame decoding (only in automatic frame generation mode).

83.3.7.1.1 Rx loopback mode

For Rx loopback mode the output of the LR is passed to the LD with manipulation via the Rx and Tx interface controllers. CTS bit (Bit 0) of the header is guaranteed to be asserted when the incoming data from the other device is looped back. In Rx Loopback mode the Rx interface controller operates in normal mode, decoding the frames (header, payloads). This allows the LFAST master to control the loopback mode on and off by sending ICLC commands.

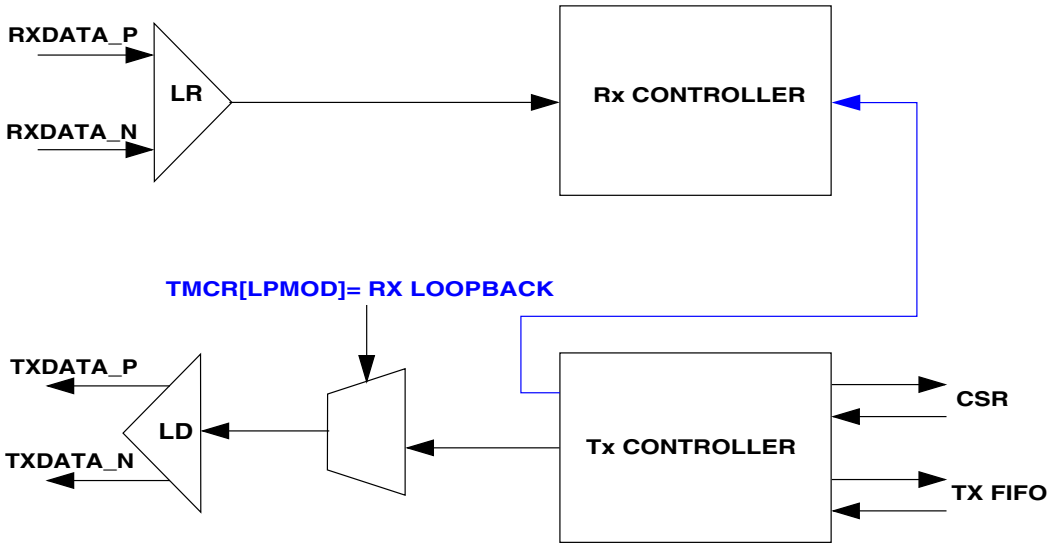

Figure 665. Rx loopback mode

Entry to Rx loopback mode:

1. S/W programs TMCR[LPMOD] = 000b.
2. Loopback can be turned on by either of the following methods:
   - S/W programs TMCR[LPON] = 1.
   - For slave only: - Reception of ICLC Frame with payload FFh (loopback mode on), from LFAST master.

Exit from Rx loopback mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0.
- For LFAST Slave: - Transmission of ICLC Frame with payload 38h (test mode off), from LFAST master.

The peer LFAST device is required to maintain at least 2-bit IFG between two loopback frames in this mode.

83.3.7.1.2 Rx LVDS loopback mode

This loopback mode is provided to verify and characterize the LVDS pads. In this loopback mode the data received by LFAST on Rx LVDS input is loopback to Tx LVDS output, bypassing LFAST. For LVDS loopback the output of the LR is passed to the LD via "Rx LVDS LoopBack Mux". Bit 0 of the header cannot be guaranteed to be asserted when the incoming data from the other device is looped back. In this loopback, the Rx interface controller operates in normal mode, decoding the frames (header, payloads) but the Tx Interface Controller is ignored.

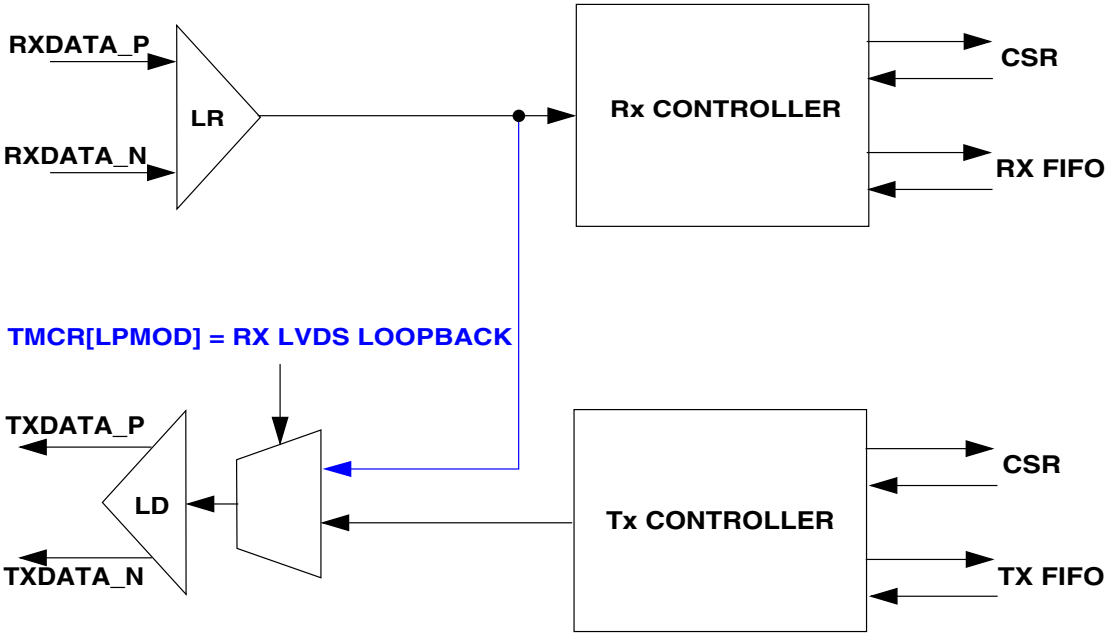

Figure 666. Rx LVDS loopBack mode

Entry to Rx LVDS loopback mode:

1. S/W programs TMCR[LPMOD] = 001b.
2. Loopback can be turned ON by either of the following methods:
   - S/W writes TMCR[LPON] = 1.
   - For slave Only: - Reception of ICLC Frame with payload = FFh (loopback mode ON), from LFAST master.

Exit from Rx LVDS loopback mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0.
- For LFAST slave:
  - Transmission of ICLC frame with payload 38h (test mode off), from LFAST master.

83.3.7.1.3 Tx loopback mode without automatic frame generation

This loopback mode is provided to verify the LFAST functionality, if LVDS pads are not functional. In this loopback mode the data transmitted by LFAST on Tx LVDS output is loopbacked internally on Rx LVDS input, bypassing LVDS pads.

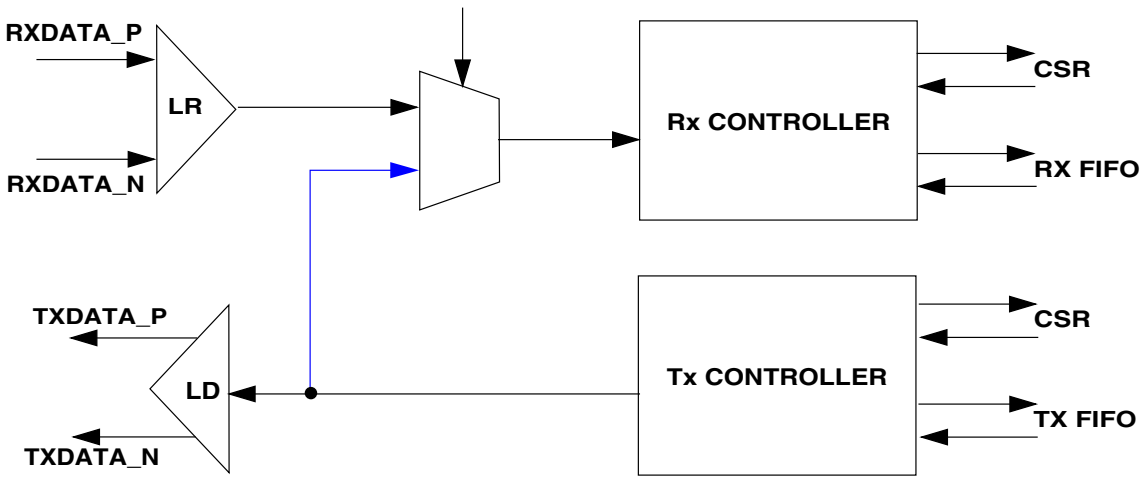

Figure 667. Tx loopBack mode without automatic frame generation

Entry to Tx loopback without automatic frame generation mode:

1. S/W programs TMCR[LPMOD] = 010b.
2. Loopback can be turned on by either of the following methods:
   - S/W programs TMCR[LPON] = 1.
   - For slave only: Reception of ICLC frame with payload FFh (loopback mode on), from LFAST master

Exit from Tx loopback without automatic frame generation mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0.
- For LFAST slave: Reception of ICLC frame with payload 38h (test mode off), from Tx interface (using unsolicited frame).

All frames and error flags are decoded in this mode.

83.3.7.1.4 Automatic frame generation

The LFAST module supports two loopback modes where pre-defined frames are generated automatically by the Tx interface and Rx interface indicates its successful reception by dedicated signals and status registers. These modes are defined for BIST like check for the LFAST, with minimal S/W intervention.

The Control register used for these modes are:

- ALCR[LPCNTEN] defines whether fixed number of auto loopback frames to be transmitted.
- ALCR[LPFMCNT] defines the number of loopback frames to be transmitted if ALCR[LPCNTEN] = 1.

The Status signals and register used for these modes are:

- GSR[LPCSDV]: Valid synchronization received.
- GSR[LPCHDV]: Frame with header of 13h received.
- GSR[LPCPDV]: Frame with payload of CBh received.
- GSR[LPTXDN]: Number of Auto loopback frame transmitted with valid synchronization, header (13h) and payload (CBh) is equal to ALCR[LPFMCNT].

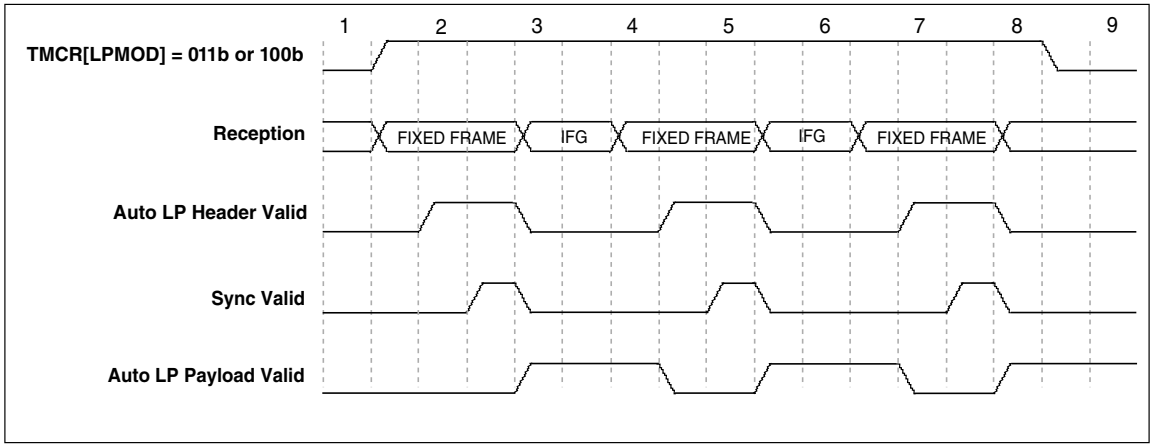

Figure 668. Automatic loopback test status signal timings

The two loopback with automatic frame generation modes are:

1. Tx loopback with automatic frame generation
2. Tx LVDS (external) with automatic frame generation

83.3.7.1.4.1 Tx loopback mode with automatic frame generation

When TMCR[LPMOD] = 011b (Tx loopback mode with automatic frame generation) the frames are generated by the Tx Interface. This mode helps to validate the Tx and Rx Path with minimal intervention from the S/W. The frames generated have fixed header of 13h and payload of CBh. The successful reception of this frame is indicated by the status signals and registers.

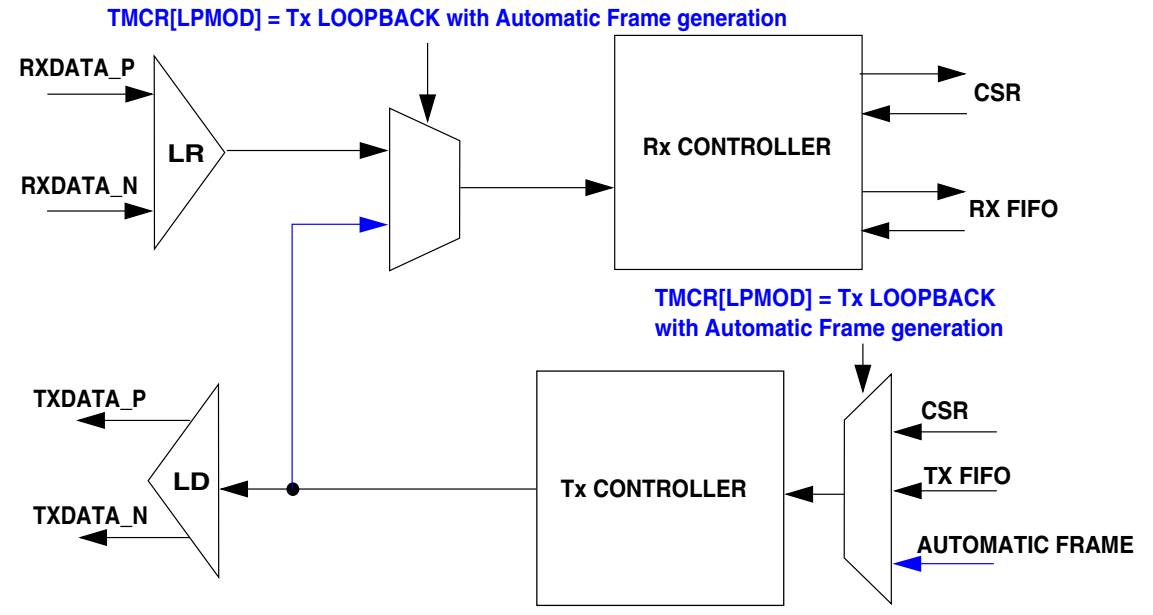

Figure 669. Tx loopBack mode with automatic frame generation

Entry to Tx loopback with automatic frame generation mode:

1. S/W programs TMCR[LPMOD] = 011b.
2. Loopback can be turned on by either of the following methods:
   - S/W programs TMCR[LPON] = 1.

- For slave only: Reception of ICLC frame with payload FFh (loopback mode on), from LFAST master.

Exit from Tx Loopback with automatic frame generation mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0.

83.3.7.1.4.2 Tx LVDS loopback (external) mode with automatic frame generation

In this mode the LD/Tx controller is used to test the LR/Rx controller. The idea is to use a test frame (predefined) from the Tx controller out through the LD, loopback completed on the DUT-board (LD connected to LR via a transmission line), back into the LR, synchronized, and correlated in the Rx controller and compared to what was sent in the downlink controller.

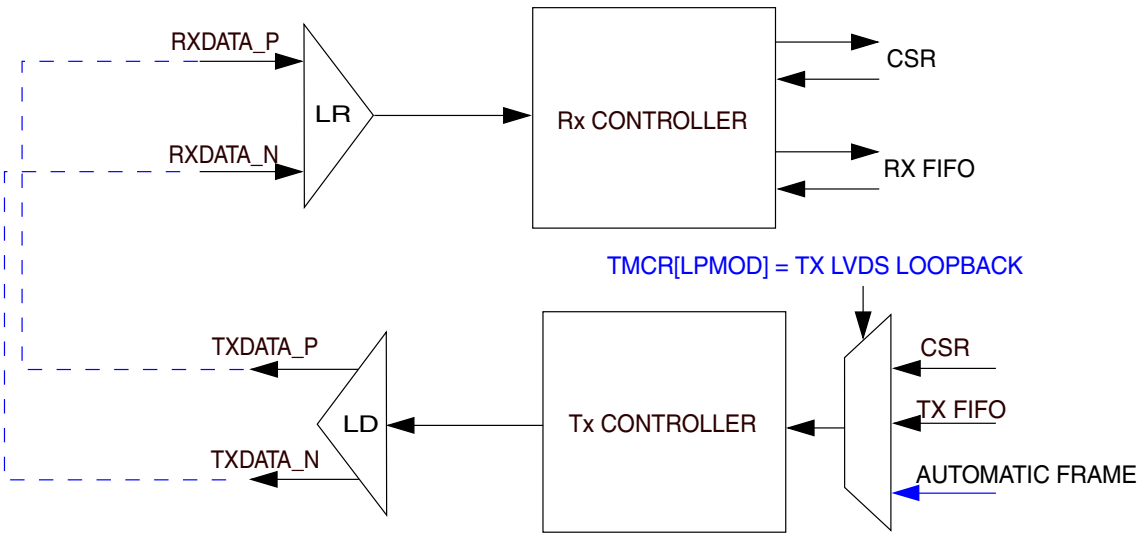

Figure 670. Tx LVDS loopback (external) mode with automatic frame generation

Entry to Tx LVDS loopback with automatic frame generation mode:

1. S/W programs TMCR[LPMOD] = 100b.
2. Loopback can be turned on by either of the following methods:
   - S/W programs TMCR[LPON] = 1.
   - For slave only: Reception of ICLC frame with payload FFh (loopback mode on), from LFAST master

Exit from Tx LVDS loopback with automatic frame generation mode can be done by the following method:

- S/W programs TMCR[LPON] = 0.

83.3.7.2 Clock test mode

The bit TMCR[CLKTST] enables or disables the clock test mode of the LFAST module. In this mode the LFAST sends fixed pattern out on the LD at the current configured RxData clock rate. It is a RWM bitfield and the default setting is 0 (off). This bit can be set under one of the following conditions:

- S/W programs TMCR[CLKTST].

The Tx Controller will send out a pattern of alternating 1 and 0 (pattern 101010...). This provides a divide by 2 test clock of the current Tx clock.

The clock test mode can be canceled by either of the following methods:

- S/W programs TMCR[CLKTST] = 0.
- For LFAST slave: Reception of ICLC frame with payload 38h (Test mode off) from LFAST master.

In clock test mode the Tx controller does not output any synchronization pattern or header, just a pattern of alternating 1's and 0's.

This mode doesn't affect the functionality of the Rx interface.

83.3.8 Clocks

The LFAST mainly works on three clocks:

- System bus clock used to program the registers.
- Protocol clock, which is either high speed PLL clock or low speed clock depending on the speed mode, used for LFAST protocol operation.
- System side module clock, which is synchronous to the system bus clock.

83.3.8.1 Clocking strategy

The following figure shows the clock domain in which each module functions. The PLL provides eight phases of the high speed clock to the Clock muxing portion of the CCM. The Clock Module will then generate four phases of slow speed clock using both the edges of lfast_sysclk, muxes high speed and low speed clocks and provides a muxed clock to the Sampler Module.

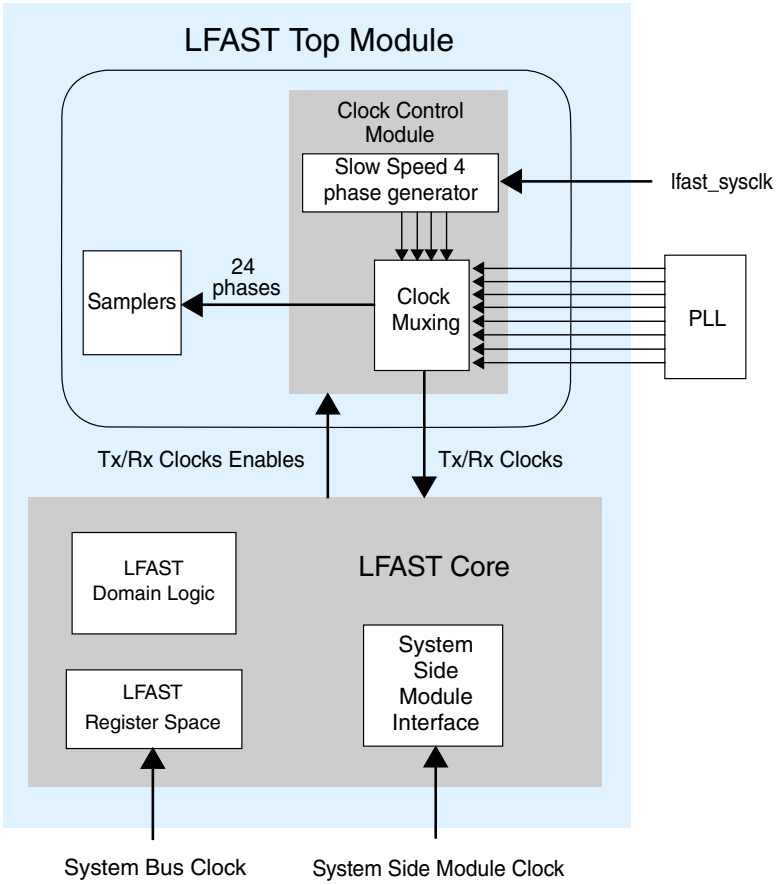

Figure 671. LFAST module clock domains

83.3.8.2 Slow speed clock

83.3.8.2.1 External muxing

The CCM will receive lfast_sysclk from the clocking subsystem as shown in Figure 672, Figure 673 and Figure 674.

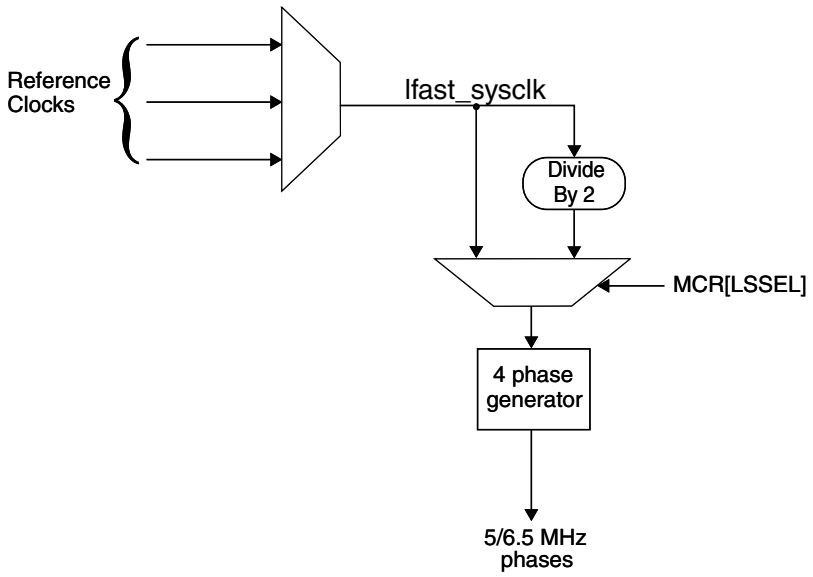

Figure 672. External clock muxing of lfast_sysclk

All the reference clocks will be muxed first to provide lfast_sysclk to the module and then either div/2 or direct muxed clock will be used to generate 4 slow speed phases in the CCM of LFAST as shown in Figure 672.

The lfast_sysclk could be either 20/26 MHz or 10/13 MHz. When lfast_sysclk is 20/26 MHz frequency, the clock control module will generate 4 phases of slow speed clock of frequency lfast_sysclk/4 when MCR[LSSEL] = 1. If lfast_sysclk is 20/26 MHz it needs to be first divided by 2 before using it for 4 phase generation in LFAST Clock Module, which generates 4 phases of half of the input frequency as shown in Figure 673 (selected clock path shown in green).

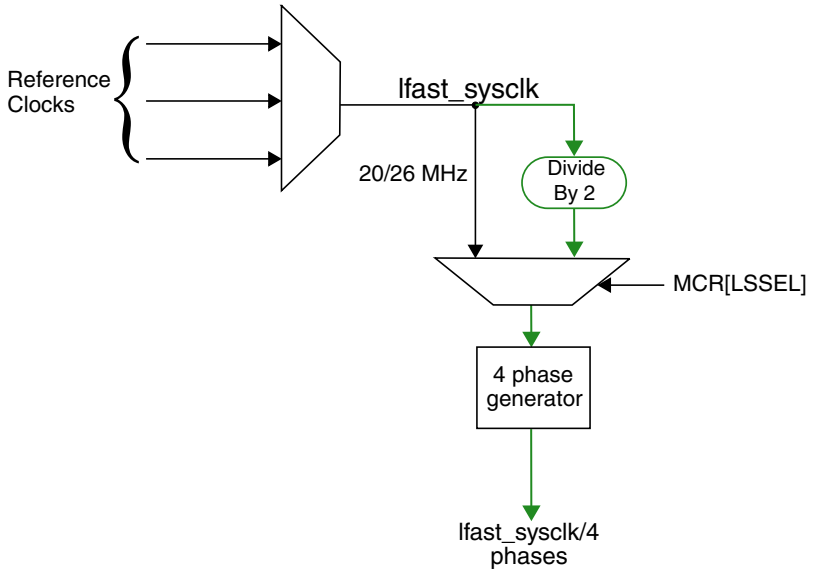

Figure 673. External clock muxing of lfast_sysclk of 20/26 MHz

In this case, lfast_sysclk is 10/13 MHz frequency, the clock control module will generate 4 phases of slow speed clock of frequency lfast_sysclk/2 when MCR[LSSEL] = 0. If lfast_sysclk is 10/13 MHz then it does not need to be first divided by 2 before using it for 4 phase generation in LFAST Clock Module, which generates 4 phases of half of the input frequency as shown in Figure 674 (selected clock path selected shown in magenta).

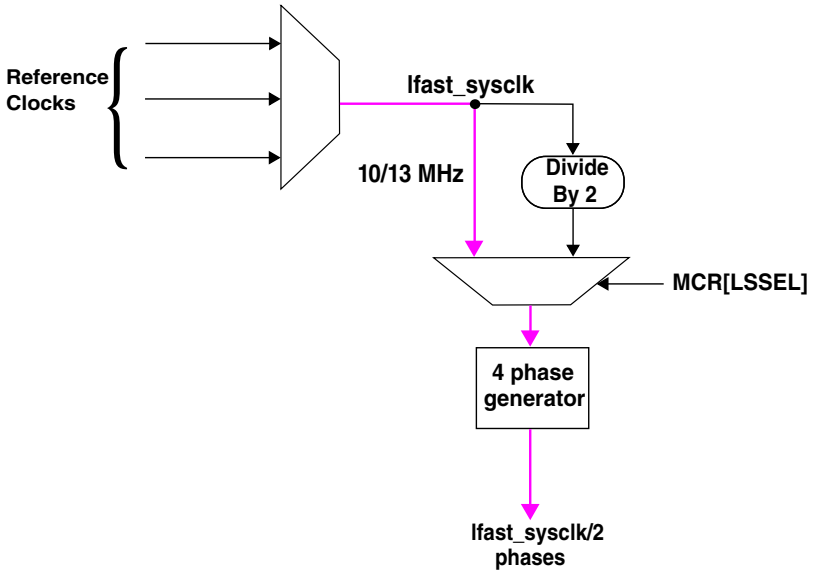

Figure 674. External clock muxing of lfast_sysclk of 10 MHz

83.3.8.2.2 Slow speed 4 phase generator

CCM will generate 4 phases of slow speed clock of frequency of 10/13 MHz. For instance, if lfast_sysclk is 10 MHz then 4 phases of 5 MHz will be generated. The following figure shows 4 phases getting generated using lfast_sysclk.

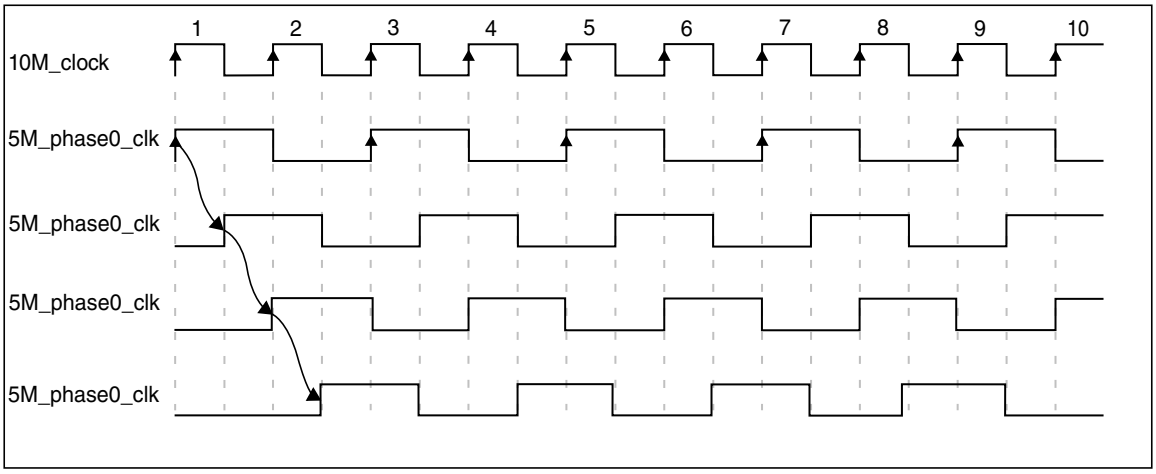

Figure 675. Slow speed 4 phases generation

83.3.8.3 Clocking module requirements for high speed phases

The high speed phases are obtained from the PLL via the Clocking Module as shown in the following figure.

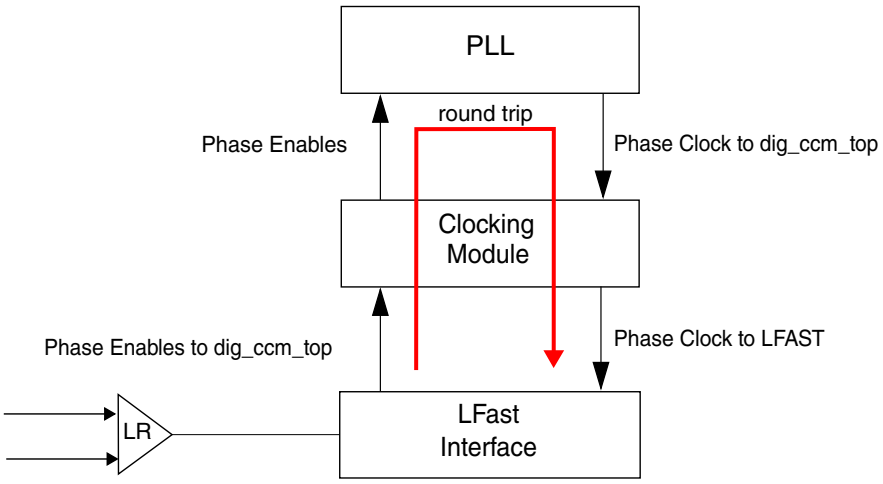

Figure 676. Clock enables and clock paths

The LFAST block will know which of the phases will be required for the different modes of operations. Therefore the LFAST block will provide enables and speed mode switches to the clocking module. The clocking module will use these signals to control the enables to the clock phases to reduce the power consumption.

The 8 phases of clocks signal are fed to the clocking module and muxed with the low speed phases. Depending on enables and data rate speed modes, the selected clocks are passed to the Sampler block and interface block.

COCR[PHSSEL] is connected to the clocking module, which selects whether 8 or 4 phases are selected for high speed mode. It is only valid for high speed.

The routing of the 8 high speed phases to the interface is critical. Each clock phase will need to have the same routing track length from the PLL to the interface of clocking module. Each of the 8 high speed phases are separated by 45 degrees. This separation needs to be maintained from the phase generator to the interface.

83.3.8.4 Clock module requirements for low speed phases

83.3.8.4.1 Low speed

The low speed clock phases are generated in clocking module. These four phases are required to sample the data correctly at low speed mode. The LFAST block will provide the enable for the phases. The clock source for the low speed phases is SYSCLK. The clocking module block will need to generate the 4 phases of low speed clock 90 degrees apart.

Using the low speed mode on the interface allows the polyphase generation logic to be turned off and the requirement of high-speed-freq × 8 MHz clock from the PLL is not needed.

Table 748. Rx clocks summary

Rx speed mode	Source
Low Speed	lfast_sysclk
High Speed	PLL

83.3.8.5 Tx controller clocks

83.3.8.5.1 Clocking module requirements for speed phases

The low speed phase 0 clock is sourced from the lfast_sysclk and the high speed phase 0 clock is sourced from the PLL. See the following table.

Table 749. Tx clocks summary

Tx speed mode	Source
Low Speed	lfast_sysclk
High Speed	PLL

83.3.8.5.2 Transmit clock muxing

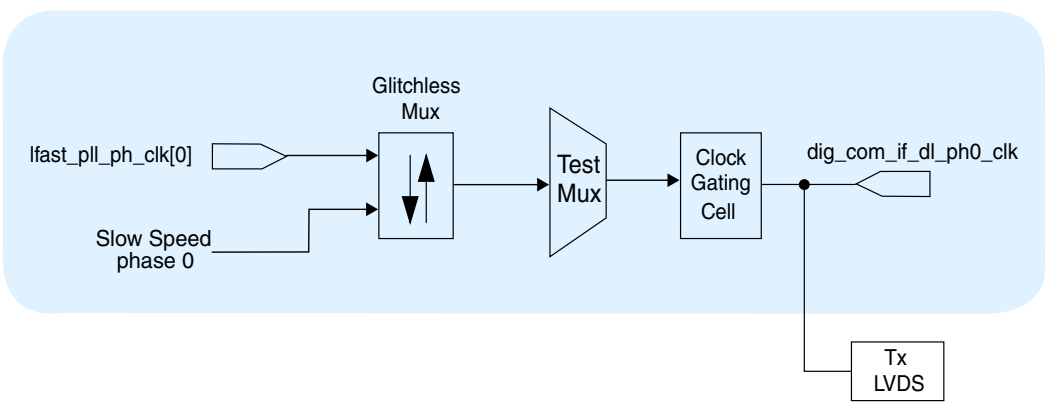

Figure 677. Transmit Clocks Muxing

83.3.8.5.3 Tx request clock control

The Tx phase 0 clock is enabled when all the resets are negated.

83.3.9 Resets

The various blocks in LFAST are reset as described in the table below.

Table 750. Recommended receive exception handling mechanism

Reset	Blocks reset
Asynchronous hardware reset	Polarity: active low • Clock Control Module (CCM) • LFAST domain logic (Rx and Tx block) • System side module interface FIFOs • LFAST register space
DRFRST bit of Mode Configuration Register (MCR)	Polarity: Active High • Clock control module (CCM) • LFAST domain logic (Rx and Tx block) • System side module interface FIFOs • LFAST register space

Table continues on the next page...

Table 750. Recommended receive exception handling mechanism (continued)

Reset	Blocks reset
DRFEN bit of Mode Configuration Register (MCR)	Polarity: active low • Clock control module (CCM) • LFAST domain logic (Rx and Tx block) • System side module interface FIFOs • LFAST Status Registers • SCR[RDR] and SCR[TDR] • TMCR[CLKTST] and TMCR[LPON] • ICR[ICLCSEQ] and ICR[SNDICLC] • PICR[PNGREQ] • UNSTCR[USNDRQ]

83.3.10 Interrupts

The LFAST module generates five interrupts to the processor:

- Transmit complete interrupt
- Transmit exception interrupt
- Receive complete interrupt
- Receive exception interrupt
- ICLC receive interrupt

Each interrupt is asserted when any one of their status conditions is met.

83.3.10.1 Transmit complete interrupt

This interrupt indicates a transfer completion of a frame. This interrupt is asserted whenever any of the following bits are set in the TISR and also the corresponding mask bits are set in the TIER.

- TXDTF
- TXICLCF
- TXUNSF
- TXPNGF

Each of these bits can be individually maskable. So, those bits that are not required to generate an interrupt to the processor can be masked. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the TISR.

83.3.10.2 Transmit exception interrupt

This interrupt indicates occurrence of an exception condition in the Tx block. This interrupt is asserted whenever any of the following bits are set in the TISR along with the corresponding mask bits in the TIER.

- TXOVF
- TXIEF

Each of these bits can be individually masked. So, those bits that are not required to generate an interrupt to the processor can be masked. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the TISR.

Table 751. Recommended transmit exception handling

Exception	Recommendation
TXOVF	• MCR[TXEN] = 0 • The system level interfaces transmit is reset and enabled again • For Slave: After reception of ICLC Ping Response Request the MCR[TXEN] may be set • For Master: The MCR[TXEN] should be set and an ICLC frame Ping Response Request should be sent
TXIEF	• The MCR[TXEN] should be set

83.3.10.3 Receive complete interrupt

This interrupt indicates a reception of a frame. This interrupt is asserted whenever any of the following bits is set in the RISR along with the corresponding interrupt enable bit is also set in the RIER.

- RXCTSF
- RXDF
- RXUNSF

Each of these bits are individually maskable. So, the bits that are not required to generate an interrupt to the processor can be masked by clearing its bit in the RIER. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the RISR.

83.3.10.4 Receive exception interrupt

This interrupt indicates occurrence of an exception condition in Rx block. This interrupt is asserted whenever any of the following bits is set in the RISR and corresponding enable mask bit is also set in the RIER.

- RXLCEF
- RXICF
- RXSZF
- RXUOF
- RXUFF
- RXMXF
- RXMNF
- RXOFF

Each of these bits are individually maskable. So, those bits that are not required to generate an interrupt to the processor can be masked by clearing the appropriate bit in the RIER. For details on the cause of assertion of each bit refer to the RISR description. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the RISR.

Table 752. Recommended receive exception handling mechanism

Exception	Recommendation
RXLCEF	The MCR[RXEN] may be set and cleared, as this exception can result in loss of subsequent packet

Table continues on the next page...

Table 752. Recommended receive exception handling mechanism (continued)

Exception	Recommendation
RXICF	No action required
RXSZF	The MCR[RXEN] may be set and cleared, as this exception can result in loss of subsequent packet
RXOFF	• The MCR[RXEN] may be cleared • The system level interfaces receive may be reset and enabled, as current transfer may be corrupted
RXUFF	No action required
RXMXF	The system level interfaces receive should be enabled, if not enabled
RXMNF	No action required
RXUNSF	No action required

83.3.10.5 ICLC receive interrupt

This interrupt indicates reception of a valid ICLC frame. This interrupt is asserted whenever any of the following bits is set in the RIISR along with the corresponding enable bit mask bit is set in the RIIER.

- ICPONF
- ICPOFF
- ICTSF
- ICTFF
- ICRSF
- ICRFF
- ICTEF
- ICTDF
- ICCTF
- ICLPF
- ICTOF
- ICPRF
- ICPSF
- ICPFF

Each of these bits are individually maskable. So those bits that are not required to generate an interrupt to the processor can be masked. For details on the cause of assertion of each bit, refer RIISR. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in RIISR.

83.3.11 Packet memory

The LFAST stores packet frames for transmission, and reads packet frames after reception. The transmitter has its own dedicated buffer and the receiver has it own dedicated buffer, and they are not shared between each other.

Table 753. Frames supported by LFAST interfaces

Frame type	Tx buffer(in bits)	Rx buffer(in bits)	Memory type
Data frame	38 × 32 max 6 packets	38 × 32 max 6 packets	FIFO
Unsolicited frame	9 × 32 max 1 packet	9 × 32 max 1 packet	Registers UNSTD[8-0], UNSRDR[8-0]
ICLC frame	1 × 7 max 1 packet[1]	1 × 8 max 1 packet[2]	Registers ICR, PISR
CTS frame	N/A	N/A	N/A

1. Only for MCR[MSEN] = 1
2. Only for ping response data when MCR[MSEN] = 1

83.4 External signals

LFAST is a five-pin interface with the following signals :

- lfast_sysclk
  - Reference clock of the LFAST master and slave.
- txdatap/txdatan
  - Differential transmit (Tx) interface pair.
- rxdatap/rxdatan
  - Differential receive (Rx) interface pair.

LFAST interface is an asynchronous high speed LVDS interface.

83.4.1 LFAST operating data rates

The change of data rate is controlled by the LFAST master by issuing appropriate Interface Control Logical Channel (ICLC) packets to the LFAST slave. In this document, the data rate 6.5Mbps /5Mbps (lfast_sysclk ÷ 4 or lfast_sysclk ÷ 2) is referred to as the low data rate. The high data rate is in the data sheet.

83.5 Initialization

The LFAST requires a sequence of operations before it can be used for communication. The procedure to enable LFAST for proper operation is listed in the following figure.

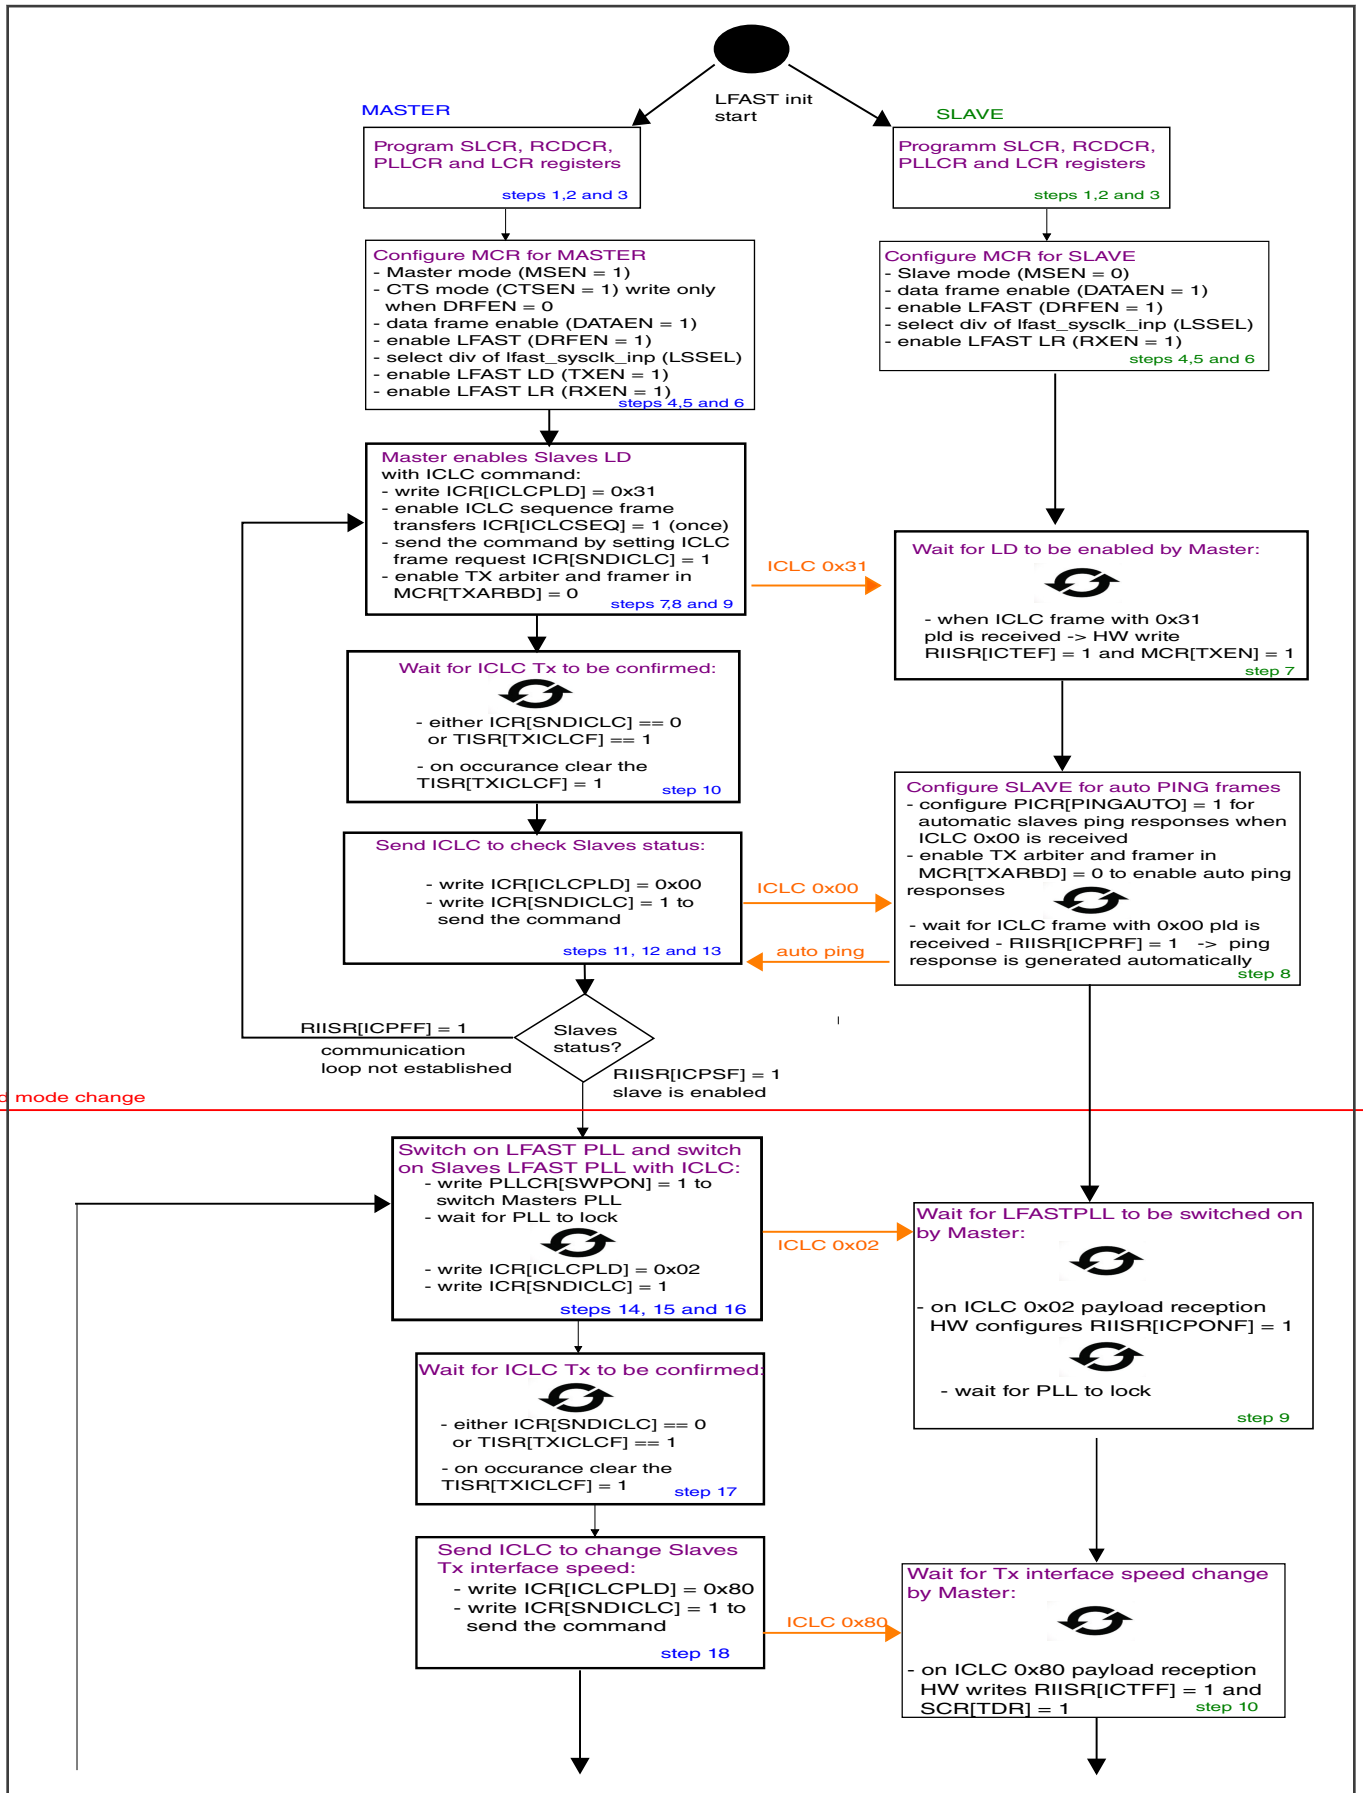

Figure 678. Startup procedure (sheet 1 of 2)

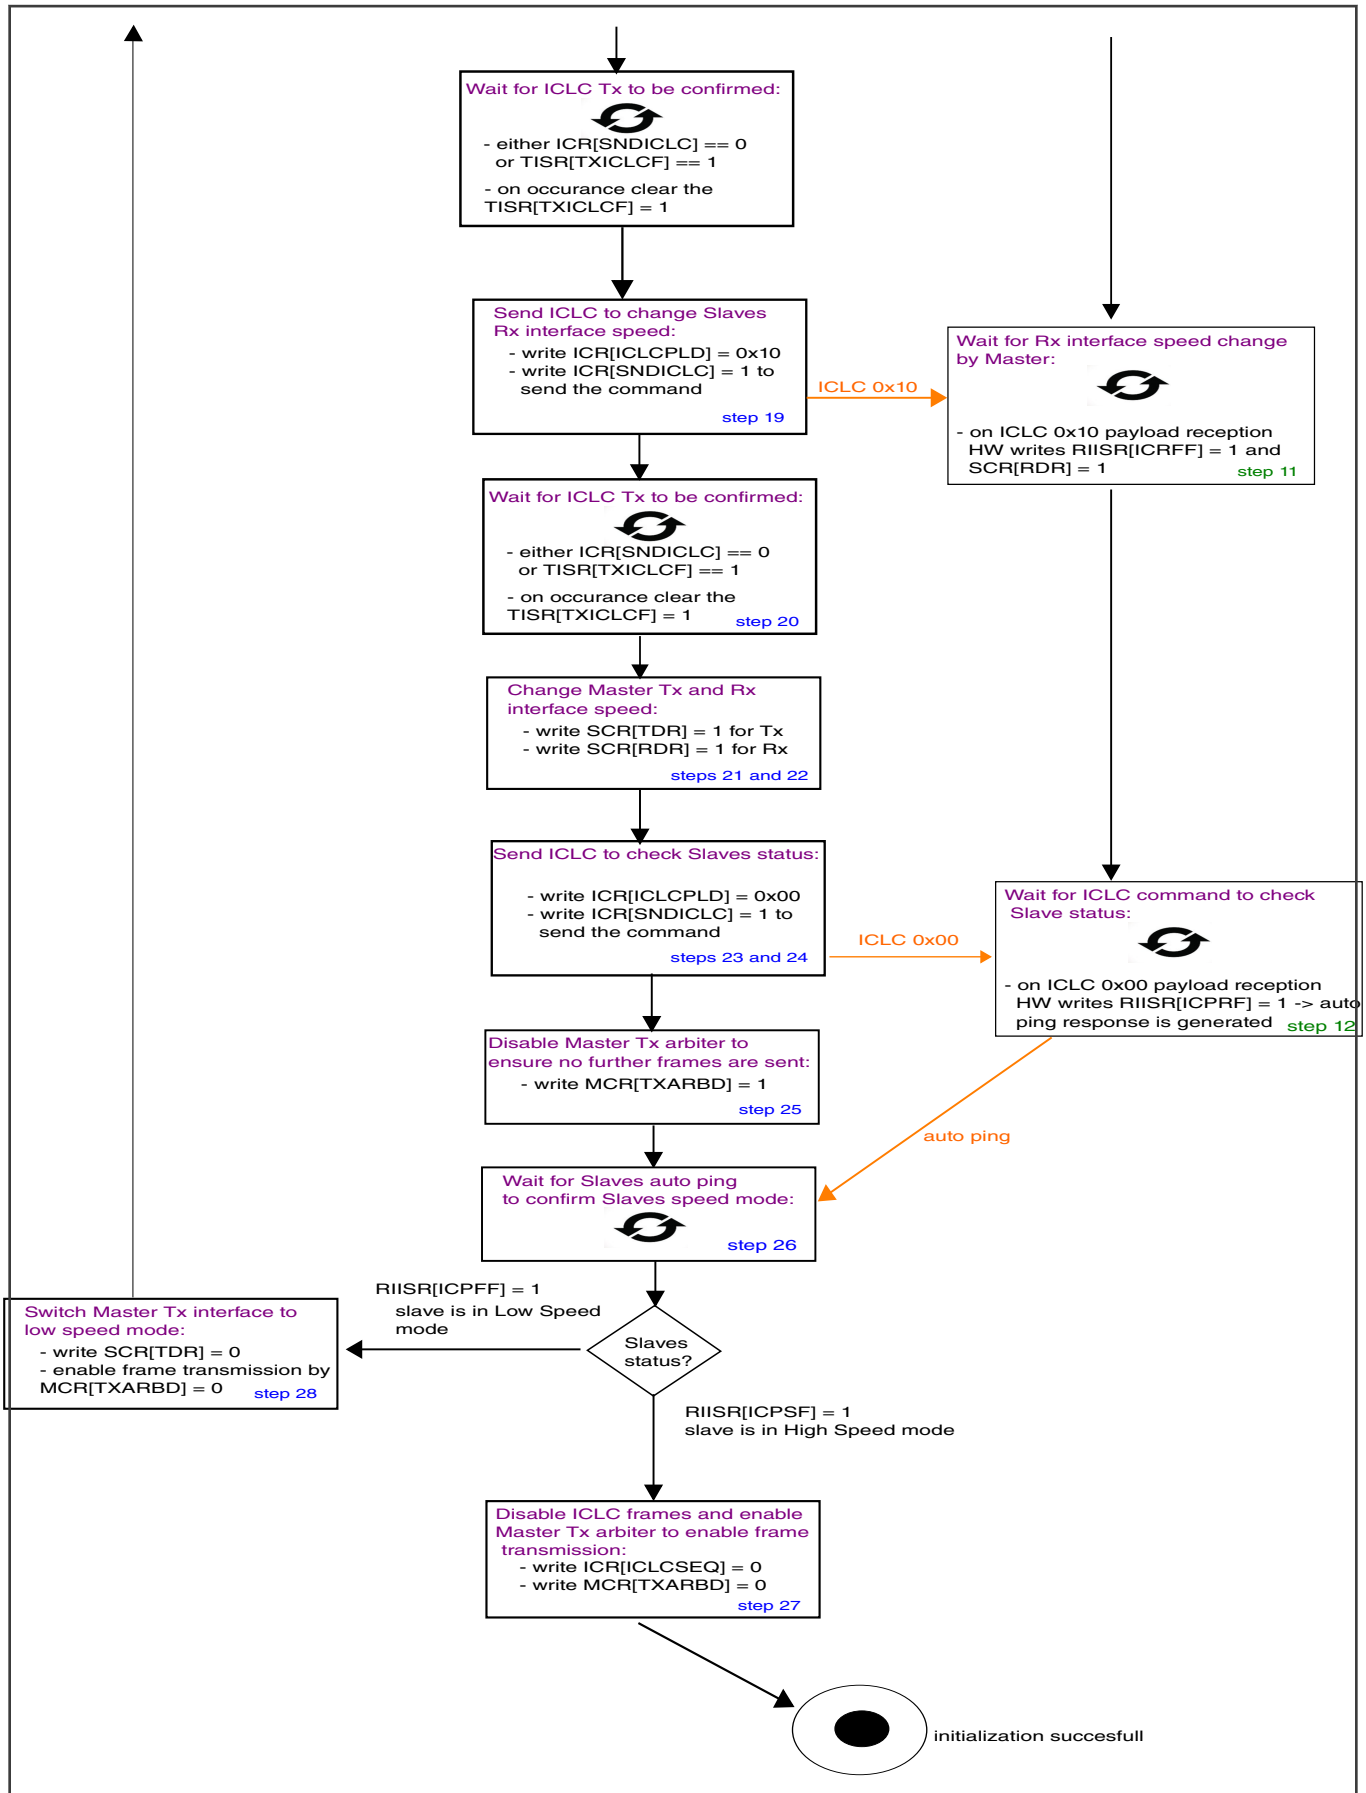

Figure 679. Startup procedure (sheet 2 of 2)

83.6 PLL configuration example

Assume that the frequency of the high speed clock is 320 MHz, with a reference clock having a frequency of 20 MHz. Follow these steps to configure the LFAST high-speed clock:

1. Write 20h to PLLCR[FBDIV] and 0b to PLLCR[FDIVEN] for the feedback division factor.
2. Write 01b to PLLCR[PREDIV] for the division factor to divide the PLL reference clock input by 2.
3. Write 1b to PLLCR[SWPON] for switching on the PLL.

You must wait for:

1. PLLLSR[PLLDIS] to become 0, indicating that the PLL is enabled.
2. PLLLSR[PLDCR] to become 1, indicating that the PLL is locked and ready for use.

The formula for calculating the PLL output frequency, with fraction divider on, is as follows:

$$\text{PLL Clock} = \left(\frac{\text{clk_in}}{\text{PLLCR[PREDIV]}}\right) \times (\text{PLLCR[FBDIV]} + 0.5) \qquad \text{where PLLCR[FDIVEN]=1}$$

The formula for calculating the PLL output frequency, with fraction divider off, is as follows:

$$\text{PLL Clock} = \left(\frac{\text{clk_in}}{\text{PLLCR[PREDIV]}}\right) \times (\text{PLLCR[FBDIV]}) \qquad \text{where PLLCR[FDIVEN]=0}$$

83.7 LFAST register descriptions

All registers are 32 bits wide.

NOTE

- Read/Write accesses to all unimplemented registers and write accesses to Read only register will return a Transfer Error.

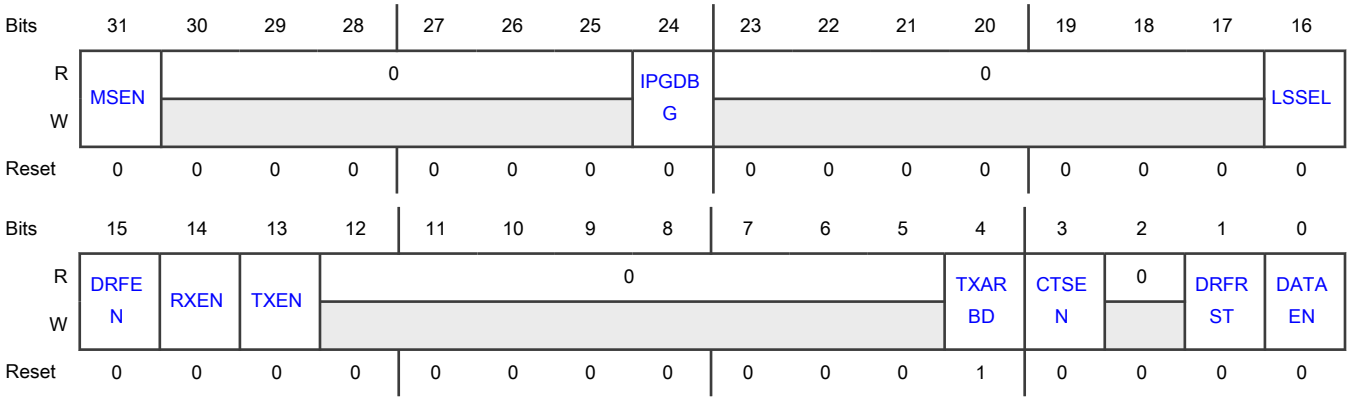
83.7.2 LFAST Mode Configuration (MCR)

Offset

Register	Offset
MCR	0h

Function
Controls the functionality of LFAST including mode configurations and soft reset.

Diagram



Fields

Field	Function
31 MSEN	LFAST Master or Slave mode Enable This bit selects either the LFAST master or slave functionality. **NOTE** Writable only once after the asynchronous reset. 0b - Enable the modules LFAST Slave functionality only. 1b - Enable the modules LFAST Master functionality only.
30-25 —	Reserved
24 IPGDBG	IPG Debug mode Control bit to enable support for IPG Debug mode. This mode is indicated by assertion of IPG debug mode signal. 0b - IPG debug mode enable signal will be ignored. 1b - IPG debug mode enable signal will not be ignored.
23-17 —	Reserved
16 LSSEL	Low Speed Select Mode Selects the fraction of sysclk in Low speed select mode (see Slow speed clock for details). 0b - Low speed mode in which the lfast_sysclk input is used to generate 4 phases of lfast_sysclk/2. 1b - Low speed mode in which the lfast_sysclk input is used to generate 4 phases of lfast_sysclk/4.
15	LFAST Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
DRFEN	This bit enables/disables the reception and transfer of LFAST device. 0b - LFAST is immediately disabled. All current/pending requests are terminated and the Tx and Rx data FIFOs are flushed. If this bit is cleared in the middle of a transmit/receive operation, then that operation is terminated immediately and nothing is transmitted/received further. All the programmable registers retain their values and status registers are cleared to their reset values. Registers read/write operations can be performed through the IPS Bus. 1b - LFAST is Enabled.
14 RXEN	LFAST Receiver Enable This bit controls the reception of the frames and decoding on the LFAST device. This bit also disables the Rx LVDS Line Receiver (LR). 0b - Receiver Interface is disabled. If this bit is cleared during a data transfer, the current frame is received and then the Rx block is disabled. After the Rx block is disabled, all new frames from LFAST peer device are ignored. System Side Module Rx interface isn't disabled by this bit. 1b - Receiver Interface is Enabled.
13 TXEN	LFAST Transmitter Enable This bit controls the transmission of frames from the LFAST device and disables the Tx LVDS LD. This bit can also be modified by LFAST slave H/W on reception of an ICLC command frame. This field can only be written in dual mode (LFAST_GSR[DUALMD] = 1). 0b - LFAST transmitter interface is disabled. No new request is accepted but ongoing request is served. 1b - LFAST transmitter interface is enabled. New requests are accepted.
12-5 —	Reserved
4 TXARBD	Tx Arbiter Disable This bit enables/disables the Tx block arbiter. Current frame transfer is completed, but new frame requests are ignored. 0b - Enable Tx arbiter and framer. When enabled it takes all the frame request and services based on priority. 1b - Disable Tx arbiter and framer. All frame requests are ignored.
3 CTSEN	CTS Enable This bit defines the Push-Pull mode of the LFAST devices receiver. This bit is used to enable/disable CTS mode of the Tx block. This bit is only writable when MCR[DRFEN] = 0. **NOTE** Only writable when MCR[DRFEN] = 0. 0b - CTS mode is disabled. Indicates that the device is in Push mode. The CTS bit of frames transmitted is 1. The CTS bit doesn't represent the status of Rx FIFO.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - CTS mode is enabled. The CTS bit of all transmit frames is set when the Rx FIFO empty space is on or above higher threshold, and cleared when the Rx FIFO empty space is on or below lower threshold.
2 —	Reserved
1 DRFRST	LFAST Soft Reset This bit is automatically cleared after reset. **NOTE** Set by user software and then cleared by system hardware. 0b - No soft reset 1b - Soft reset to LFAST is asserted. When set it causes a reset of the LFAST module; all the registers will be reset to their default values and all the FIFOs will be flushed.
0 DATAEN	DATA Frame Enable This bit enables/disables the transmission and reception of data frames between the LFAST master and slave devices. 0b - Data frame transmission and reception is disabled. Tx data frame requests are ignored by the transmitter. Frame with LCT of data frame is ignored by the receiver. 1b - Data frame transmission and reception is enabled. Tx data frame requests are serviced by the transmitter. Frame with LCT of data frame is received and placed into the Rx data FIFO.

83.7.3 LFAST Speed Control (SCR)

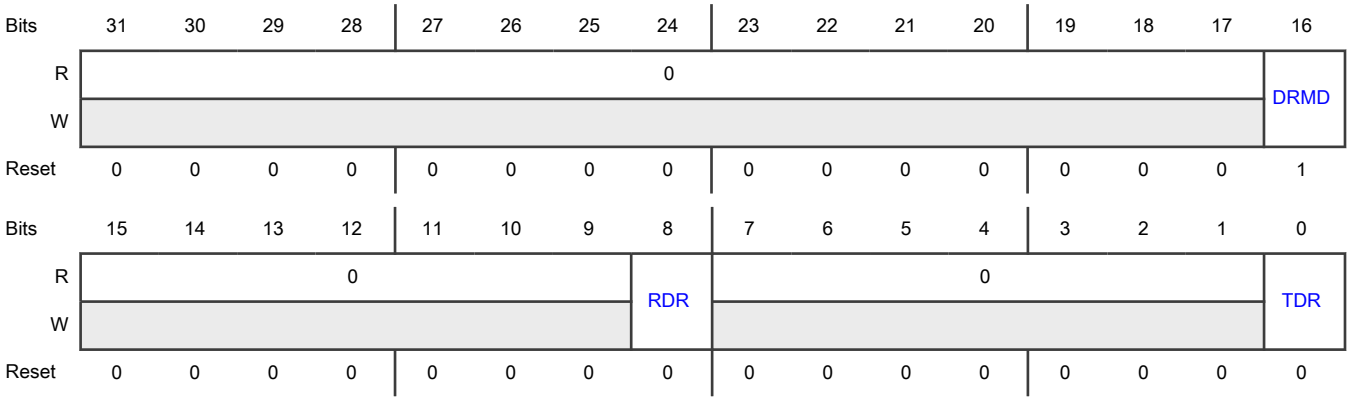
Offset

Register	Offset
SCR	4h

Function

Configure the Rx and Tx data rate of the LFAST.

Diagram



Fields

Field	Function
31-17 —	Reserved
16 DRMD	Data Rate Controller mode Defines the mode setting for LFAST slave device by S/W or LFAST master. 0b - S/W controls the data rate controller mode. In LFAST Slave the ICLC frames for rate change have no affect on the data rate. 1b - In LFAST Slave the reception of ICLC frame for rate change sets appropriate speed mode. In LFAST master the SCR[DRMD] should be 0.
15-9 —	Reserved
8 RDR	Receiver Data Rate This bit defines the receiver data rate. For LFAST master: • S/W should program this bit only after transmission of an ICLC frame changing the speed mode of the slaves Tx interface. For LFAST slave: • When SCR[DRMD] = 1, the H/W programs this bit on reception of ICLC frame for changing speed mode of Slaves Rx interface. • The S/W can program this bit when SCR[DRMD] = 0. • This bit is cleared on MCR[DRFEN] negation. 0b - Data rate of Rx block is low speed. 1b - Data rate of Rx block is high speed.
7-1	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
0 TDR	Transmit Data Rate This bit defines the transmitter data rate. For LFAST master: • S/W should program this bit only after transmission of an ICLC frame changing the speed mode of the slaves Rx interface. For LFAST slave: • When SCR[DRMD] = 1, the H/W programs this bit on reception of ICLC frame for changing speed mode of Slaves Tx interface. • The S/W can program this bit when SCR[DRMD] = 0. • This bit is cleared on MCR[DRFEN] negation. 0b - Data rate of Tx block is low speed. 1b - Data rate of Tx block is high speed.

83.7.4 LFAST Correlator Control (COCR)

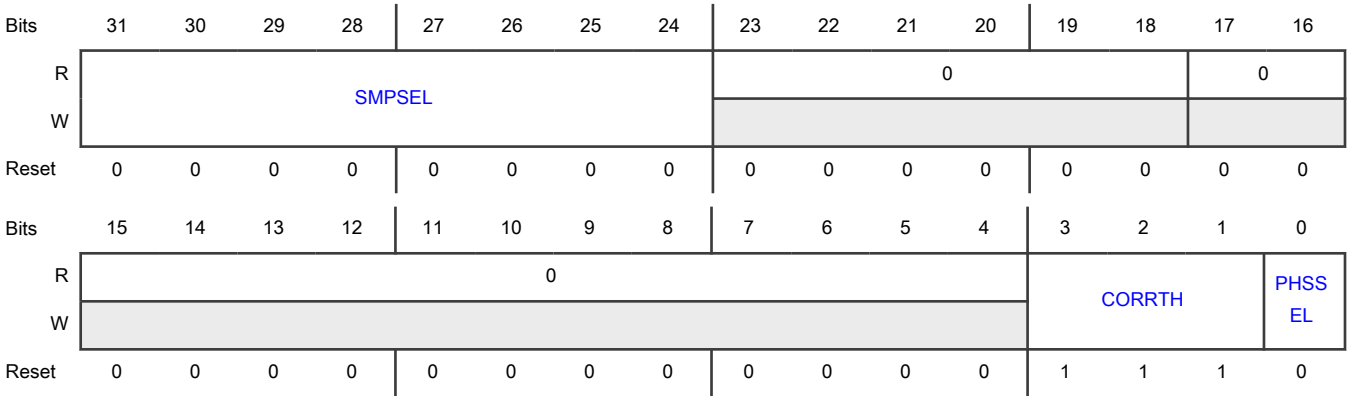
Offset

Register	Offset
COCR	8h

Function

Selects the sampler data path and the number of bits of correlation to be used.

Diagram



Fields

Field	Function
31-24 SMPSEL	Sampler Data Path Selector (overrides the correlator selection) Defines the sampler data path to be activated at all the times. All the bits should be 0 (00h) for Sampler Data Path to be selected by the correlator. In Low Speed mode only Sampler Data Paths 0-3 are valid. This field can only be written when MCR[RXEN] = 0. 00h Sampler Data Path selected by correlator 01h Sampler Data Path 0 selected 02h Sampler Data Path 1 selected 04h Sampler Data Path 2 selected 08h Sampler Data Path 3 selected 10h Sampler Data Path 4 selected 20h Sampler Data Path 5 selected 40h Sampler Data Path 6 selected others Sampler Data Path 7 selected
23-18 —	Reserved
17-16 —	Reserved
15-4 —	Reserved
3-1 CORRTH	Correlator Threshold Level Defines the correlation threshold level. This field can only be written when MCR[RXEN] = 0. 000 9 Bits of correlation 001 10 Bits of correlation ... 110 15 Bits of correlation 111 16 Bits of correlation
0 PHSSEL	Polyphase 8 or 4 phase selection. Defines the number of phases for the polyphase generator used. This bit is ignored in low speed mode since only 4 Phases are used in low speed mode. In High Speed mode phase 0, 2, 4 and 6 are used when 4 phase mode is selected. This field can only be written when MCR[RXEN] = 0 0b - 8 phases 1b - 4 phases

83.7.5 LFAST Test Mode Control (TMCR)

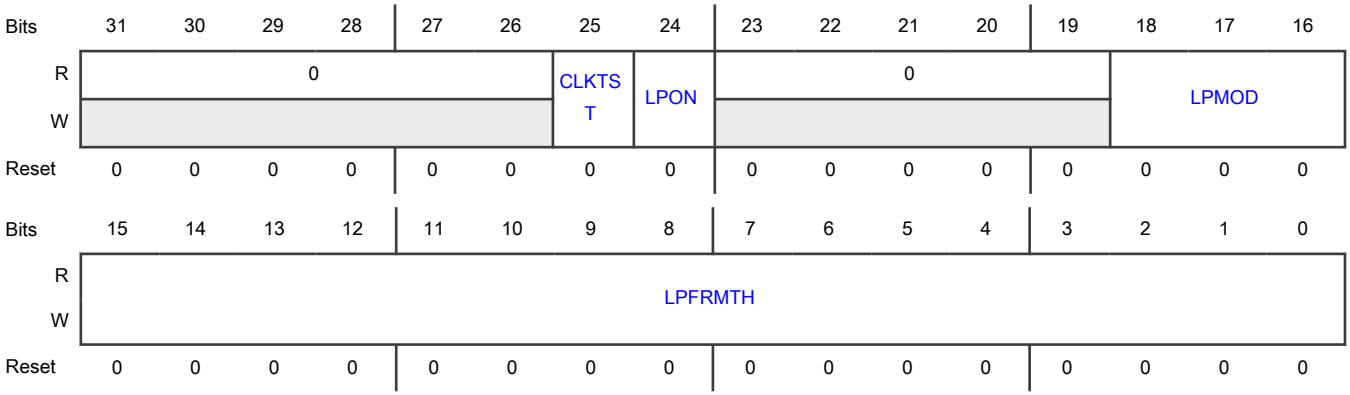
Offset

Register	Offset
TMCR	Ch

Function

Enables and configures the LFAST clock test and loopback modes.

Diagram



Fields

Field	Function
31-26 —	Reserved
25 CLKTST	Clock Test Mode S/W can define when the clock test mode is enabled. This bit can also be set and cleared by LFAST slave H/W on reception of an ICLC command. 0b - Clock test mode disabled 1b - Clock test mode enabled
24 LPON	Loopback Mode Logic Enable S/W can define when the loopback logic is enabled. This bit can also be written by LFAST slave H/W on reception of an ICLC command. 0b - Loopback mode is disabled 1b - Loopback mode is enabled
23-19 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
18-16 LPMOD	Loopback Mode Defines the type of loopback mode enabled. This field can only be written when TMCR[LPON] = 0. 000b - Rx loopback 001b - Rx LVDS loopback 010b - Tx loopback without automatic frame generation 011b - Tx loopback with automatic frame generation 100b - Tx LVDS loopback (external) with automatic frame generation 101b - Reserved 110b - Reserved 111b - Reserved
15-0 LPFRMTH	Loopback check mode valid pass frames threshold value. Defines the number of frames to verify before setting GCR[LPFPDV] when running in automatic loopback frame mode. The loopback frame is considered pass when the payload is CBh, header is 13h and sync is valid. This mode is valid only when TMCR[LPMOD] = 011b or TMCR[LPMOD] = 100b. This field can only be written when TMCR[LPON] = 0. 0000h Reserved 0001h Check 1 frame have correct sync, header and payload. ... FFFEh Check 65534 frames have correct sync, header and payload. FFFFh Check 65535 frames have correct sync, header and payload.

83.7.6 LFAST Auto Loopback Control (ALCR)

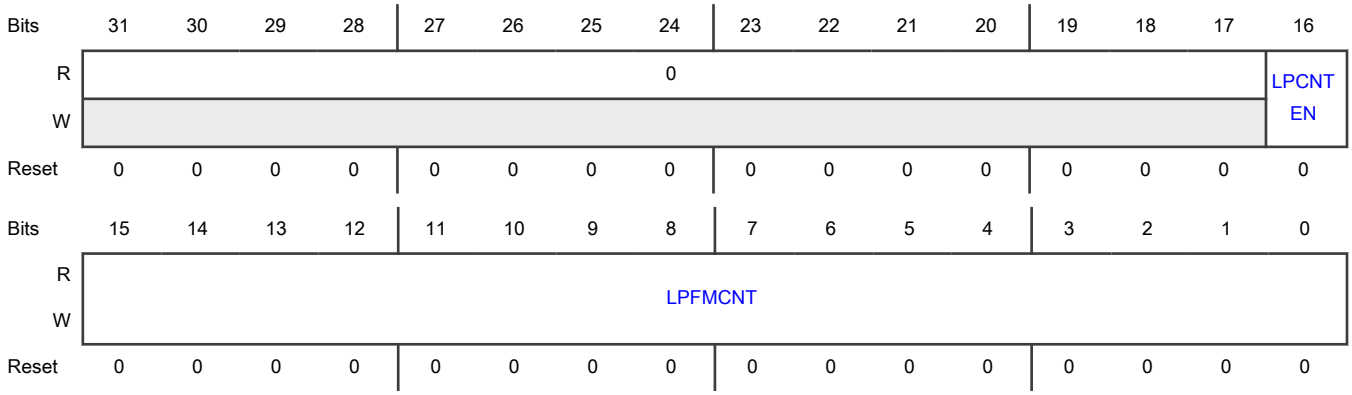
Offset

Register	Offset
ALCR	10h

Function

Enables and configures the loopback frame transmission count.

Diagram



Fields

Field	Function
31-17 —	Reserved
16 LPCNTEN	Auto Loopback Frame Transmission Count Enable Enables fixed number of auto pre-defined loopback frame transmission. This field can only be written when TMCR[LPON] = 0. 0b - Infinite pre-defined loopback frame transmission enabled 1b - Fixed count of pre-defined loopback frame transmission enabled
15-0 LPFMCNT	Auto Loopback Frame Transmission Count Defines the number of pre-defined auto loopback frames to be sent. The pre-defined loopback frame has payload CBh, header 13h and valid sync. This mode is valid if TMCR[LPMOD] = 011b or TMCR[LPMOD] = 100b. This field can only be written when TMCR[LPON] = 0. 0000h Reserved. 0001h Send 1 frame with correct sync, header and payload ... FFFEh Send 65534 frames with correct sync, header and payload FFFFh Send 65535 frames with correct sync, header and payload.

83.7.7 LFAST Rate Change Delay Control (RCDCR)

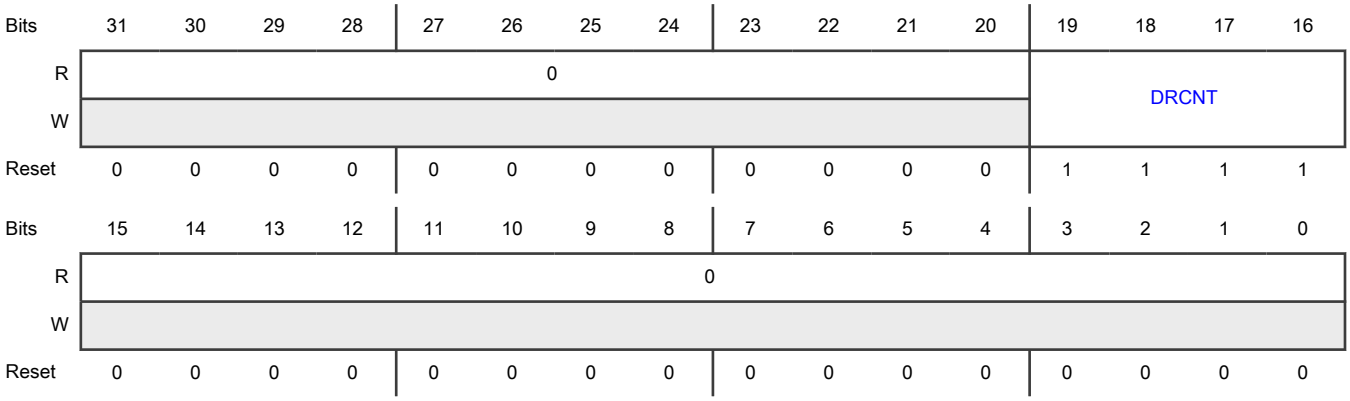
Offset

Register	Offset
RCDCR	14h

Function

Configure the number of cycles of Phase 0 clock needed by the Tx interface data rate change controller to switch from one speed mode to another.

Diagram



Fields

Field	Function
31-20 —	Reserved
19-16 DRCNT	Data Rate Controller Counter Value Defines the number of cycles of Phase 0 clock needed by the Tx interface Data rate change controller to switch from one speed mode to another. The arbitrator ignores all requests during this period. This field can only be written when MCR[DRFEN] = 1. Number of cycles = DRCNT value.
15-0 —	Reserved

83.7.8 LFAST ICLC Control (ICR)

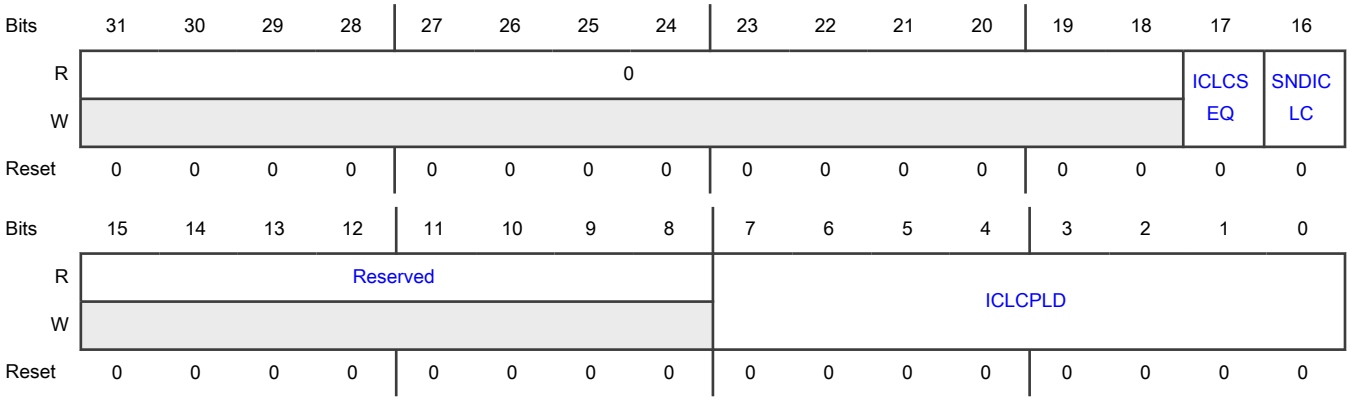
Offset

Register	Offset
ICR	1Ch

Function

Configures the interface control logical channel (ICLC) frame transfer.

Diagram



Fields

Field	Function
31-18 —	Reserved
17 ICLCSEQ	ICLC Enabled This bit should be set whenever the S/W is performing a series of ICLC frame transfers. This bit ensures only ICLC frame transmission request is serviced, other pending frames request are ignored. 0b - Single ICLC frame transfer. 1b - S/W is performing ICLC frame transfers. Only the ICLC frames will be scheduled during this period. All the other frames will be scheduled only after ICR[ICLCSEQ] = 0.
16 SNDICLC	ICLC Frame Request This bit is set to initiate the transfer of ICLC frame by LFAST master. This bit should be set (ICR[SNDICLC] = 1) after writing the required ICLC payload to be transmitted in the ICLCPLD field of the register. This bit is self clearing, which will be cleared when ICLC frame transfer is complete. Set by user software and cleared by system hardware. 0b - No Valid ICLC frame for transfer. 1b - Valid ICLC frame for transfer.
15-8 —	Reserved
7-0 ICLCPLD	ICLC Payload This field is used to program the payload of the ICLC frame to be transmitted. New ICLC payload should be set when ICR[SNDICLC] = 0. This field can only be written when ICR[SNDICLC] = 0 (see Table 746 for supported ICLC payloads).

83.7.9 LFAST Ping Control (PICR)

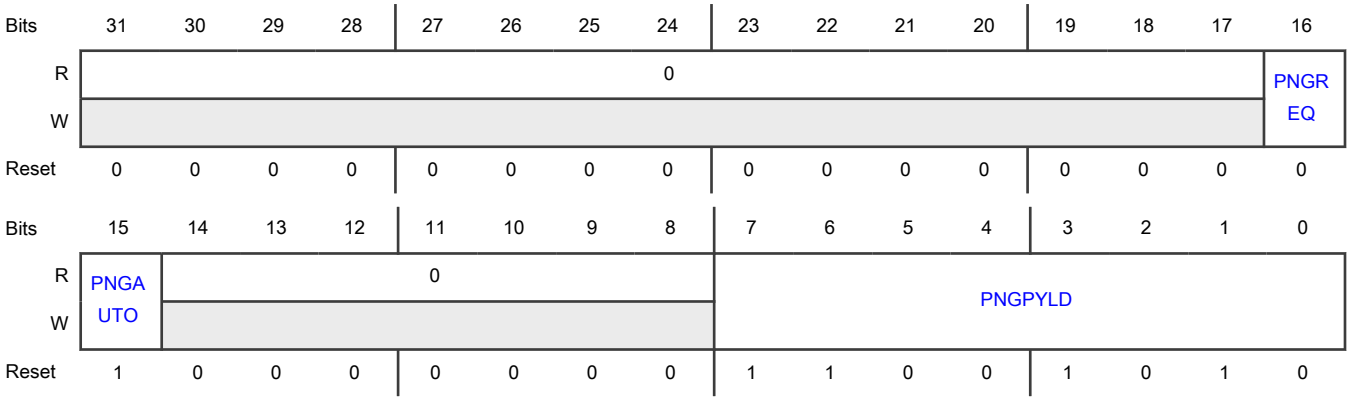
Offset

Register	Offset
PICR	20h

Function

Configures the ping response frame transfer.

Diagram



Fields

Field	Function
31-17 —	Reserved
16 PNGREQ	Ping Response Frame Request This bit is set to initiate the transfer of Ping response frame. Cleared after transmission of Ping response frame. Set by user software and cleared by system hardware. 0b - No pending Ping response frame transmission request 1b - Ping response frame transmission request is queued
15 PNGAUTO	Ping Response Enable Defines when ping response should be automatically sent on reception of Ping ICLC frame from LFAST master. This field can only be written when MCR[DRFEN] = 0. 0b - Ping response should not be automatically sent. 1b - Ping response should be automatically sent.
14-8 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
7-0 PNGPYLD	LFAST Slave: Defines the LFAST slaves ping reply frame payload content. This field can only be written when MCR[DRFEN] = 0. LFAST Master: Defines the expected payload of ping response frame. Used for comparison with ping frame received.

83.7.10 LFAST Rx FIFO CTS Control (RFCR)

Offset

Register	Offset
RFCR	2Ch

Function

Configures the Rx FIFO lower and higher threshold values which are used to define the condition for CTS bit of the frame.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1

Fields

Field	Function
31-22 —	Reserved
21-16 RCTSMX	Rx FIFO Maximum Threshold Defines the condition for CTS bit of frames to be negated. This field can only be written when LFAST_MCR[DRFEN] = 0.
15-6 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
5-0 RCTSMN	Rx FIFO Minimum Threshold Defines the condition for CTS bit of frames to be set. This field can only be written when LFAST_MCR[DRFEN] = 0.

83.7.11 LFAST Tx Interrupt Enable (TIER)

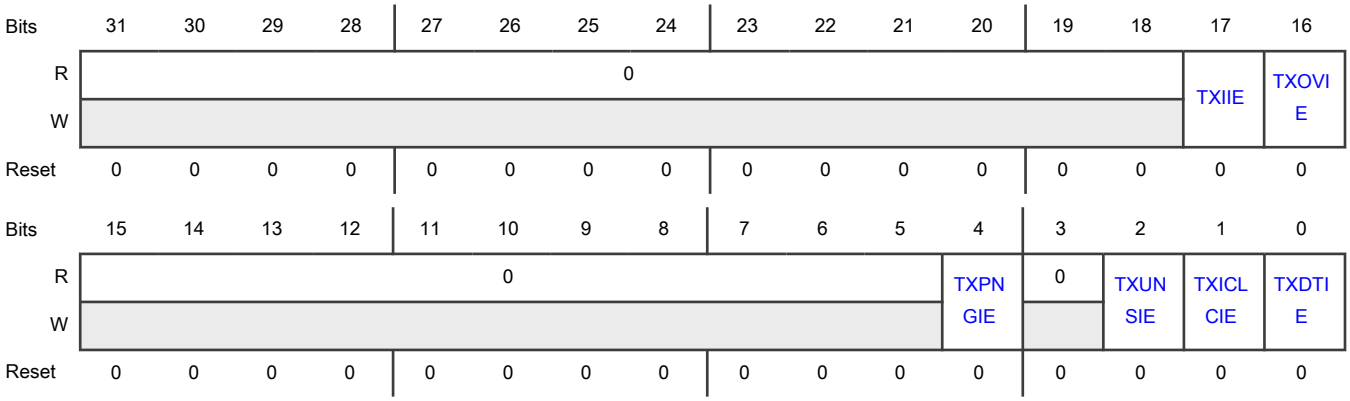
Offset

Register	Offset
TIER	30h

Function

Configures the frame transmit interrupt enables.

Diagram



Fields

Field	Function
31-18 —	Reserved
17 TXIIE	Tx Data Interface Not Enabled - (Mask) Enables or disables the interrupt. Tx Data Interface not enabled and a frame is ready to be transmitted 0b - Interrupt is disabled 1b - Interrupt is enabled
16 TXOVIE	Transmit Data FIFO Overflow Interrupt Enable.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Interrupt is disabled 1b - Interrupt is enabled
15-5 —	Reserved
4 TXPNGIE	Ping Response Frame Transmitted Interrupt Enable. 0b - Interrupt is disabled 1b - Interrupt is enabled
3 —	Reserved
2 TXUNSIE	Unsolicited Frame transmitted Interrupt Enable 0b - Interrupt is disabled 1b - Interrupt is enabled
1 TXICLCIE	This field is 0 when MCR[MSEN] is 0. ICLC Frame Transmitted Interrupt Enable 0b - Interrupt is disabled 1b - Interrupt is enabled
0 TXDTIE	Data Frame Transmitted Interrupt Enable 0b - Interrupt is disabled 1b - Interrupt is enabled

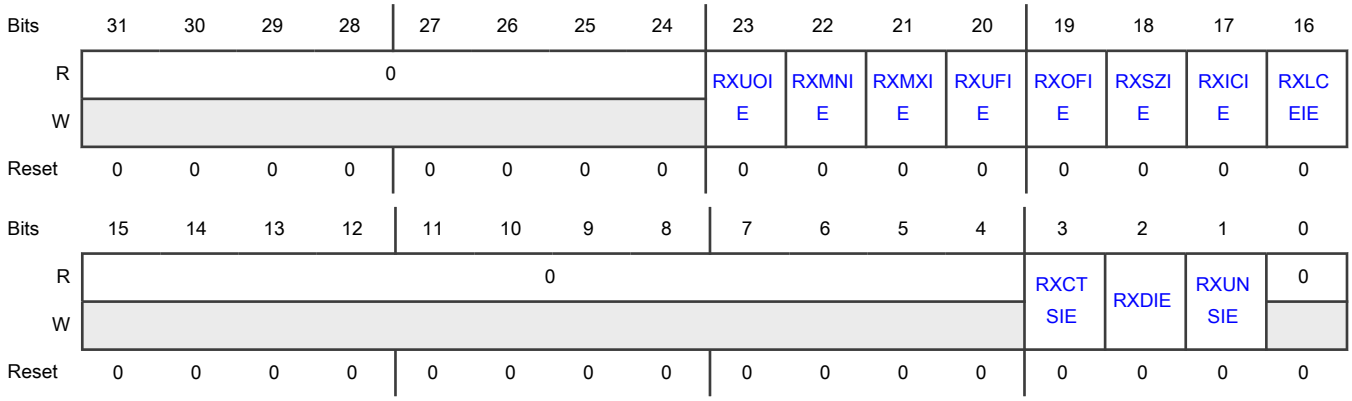
83.7.12 LFAST Rx Interrupt Enable (RIER)

Offset

Register	Offset
RIER	34h

Function
Configures the frame receive interrupt enables.

Diagram



Fields

Field	Function
31-24 —	Reserved
23 RXUOIE	Unsolicited frame register overflow. Indicates existing unsolicited frame hasn't been read and a new unsolicited frame has arrived. 0b - Interrupt is disabled 1b - Interrupt is enabled
22 RXMNIE	Rx Data FIFO Min Threshold reached 0b - Interrupt is disabled 1b - Interrupt is enabled
21 RXMXIE	Rx Data FIFO Max Threshold reached 0b - Interrupt is disabled 1b - Interrupt is enabled
20 RXUFIE	Rx Data FIFO Underflow 0b - Interrupt is disabled 1b - Interrupt is enabled
19 RXOFIE	Rx Data FIFO Overflow 0b - Interrupt is disabled 1b - Interrupt is enabled
18 RXSZIE	Frame with unsupported frame size received. Valid frame sizes are defined in Table 753 0b - Interrupt is disabled 1b - Interrupt is enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
17 RXICIE	Invalid ICLC code Received 0b - Interrupt is disabled 1b - Interrupt is enabled
16 RXLCEIE	Invalid Logical Channel Type 0b - Interrupt is disabled 1b - Interrupt is enabled
15-4 —	Reserved
3 RXCTSIE	Frame with CTS bit Low Received 0b - Interrupt is disabled 1b - Interrupt is enabled
2 RXDIE	Data frame received 0b - Interrupt is disabled 1b - Interrupt is enabled
1 RXUNSIE	Unsolicited Frame received 0b - Interrupt is disabled 1b - Interrupt is enabled
0 —	Reserved

83.7.13 LFAST Rx ICLC Interrupt Enable (RIIER)

Offset

Register	Offset
RIIER	38h

Function
Configures the ICIL frame receive interrupt enables.

0 ICPONIE	ICLC frame for PLL ON received 0b - Interrupt is disabled 1b - Interrupt is enabled

83.7.14 LFAST PLL Control (PLLCR)

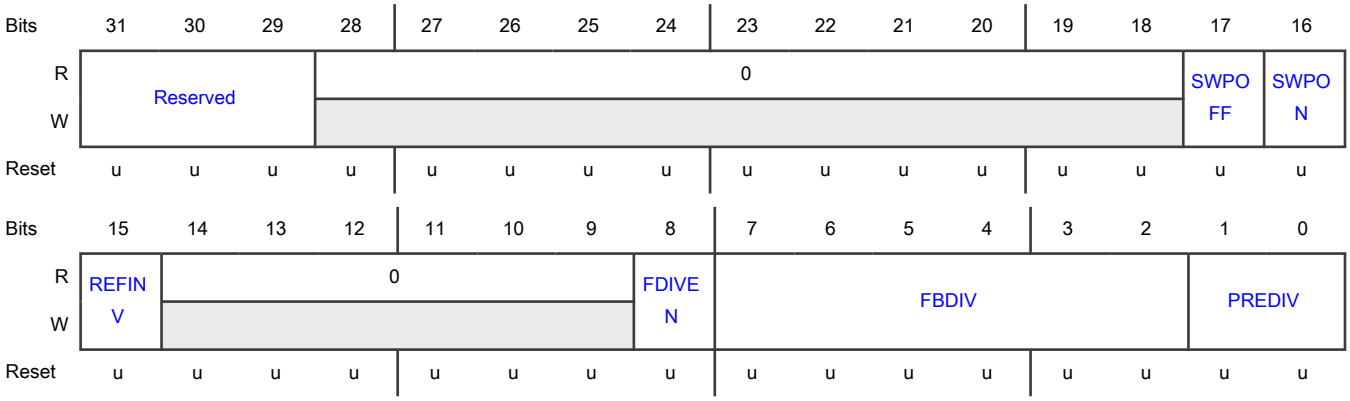
Offset

Register	Offset
PLLCR	3Ch

Function

Defines the PLL configuration.

Diagram



Fields

Field	Function
31-29 —	Reserved
28-18 —	Reserved
17 SWPOFF	SW signal to turn OFF the PLL. Set by user software and cleared by system hardware. 0b - No effect 1b - PLL will be turned OFF.
16 SWPON	SW signal to turn ON the PLL. Set by user software and cleared by system hardware. 0b - No effect 1b - PLL will be turned ON
15 REFINV	Inverts reference clock edge to PFD. If System PLL PFD using same reference clock, enabling this feature will minimize noise injection crosstalk via the substrate. 0b - Do not inverted 1b - Invert
14-9 —	Reserved
8 FDIVEN	Enable fraction division mode in feedback divider. Enables the division of vco clock output by a factor of (FBDIV + 0.5). 0b - Fraction division mode not enabled 1b - Fraction division mode enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
7-2 FBDIV	Feedback Division factor for VCO output clock. This field can only be written when LFAST_MCR[DRFEN] = 0. 00h No clock output 01h – 0Ah Reserved 0Bh Divide by 11 12 (11.5, if FDIVEN = 1) ... ... 1Fh Divide by 31 32 (31.5, if FDIVEN = 1) 20h – 3Fh Reserved
1-0 PREDIV	Division factor for PLL Reference Clock input. This field can only be written when LFAST_MCR[DRFEN] = 0. 00b - Direct clock passed 01b - Divide by 2 10b - Divide by 3 11b - Divide by 4

83.7.15 LFAST LVDS Control (LCR)

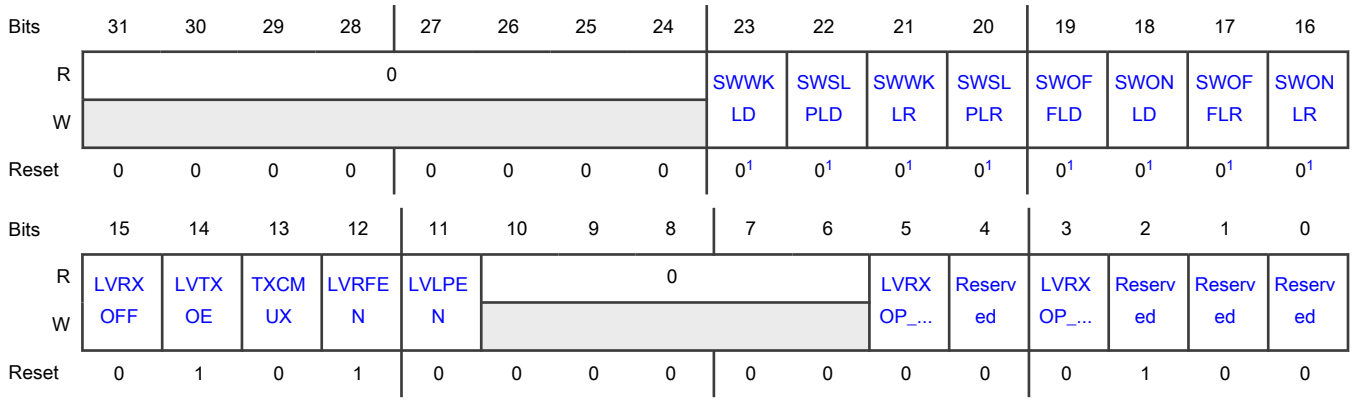
Offset

Register	Offset
LCR	40h

Function

Defines the LVDS interface configuration for LD and LR.

Diagram



1. Set by user software and cleared by system hardware.

Fields

Field	Function
31-24 —	Reserved
23 SWWKLD	SW signal to take LVDS LD out of Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE** Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LD will be taken out of sleep (provided no other source is trying to put it in sleep)
22 SWSLPLD	SW signal to put LVDS LD into Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE** Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LD will be put in sleep
21 SWWKLR	SW signal to take LVDS LR out of Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE** Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LR will be taken out of sleep (provided no other source is trying to put it in sleep)
20 SWSLPLR	SW signal to put LVDS LR into Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE** Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LR will be put in sleep (provided no other source is trying to wake it up)
19 SWOFFLD	SW signal to turn OFF the LVDS LD. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE** Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LD will be turned OFF(provided no other source is trying to turn the LD ON)
18 SWONLD	SW signal to turn ON the LVDS LD. This field can only be written when LFAST_MCR[DRFEN] = 1.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LD will be turned ON
17 SWOFFLR	SW signal to turn OFF the LVDS LR. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE** Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LR will be turned OFF (provided no other source is trying to turn the LR ON)
16 SWONLR	SW signal to turn ON the LVDS LR. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE** Writes are not reflected in the read of this field. 0b - No effect 1b - LVDS LR will be turned ON
15 LVRXOFF	Indicates the value driven onto LVDS LR output when in shutdown mode
14 LVTXOE	LVDS LD output buffer enable. 0 LVDS LD output buffer enable is disabled. 1 LVDS LD output buffer enabled
13 TXCMUX	Tx and Clock Mux The bit can be used to bring out PLL Phase 0 clock on Tx LVDS pad. 0 No effect 1 PLL Phase 0 clock will be brought out to Tx LVDS pad
12 LVRFEN	LVDS pad reference enable 0 LVDS reference pad disabled 1 LVDS reference pad enabled
11 LVLPEN	Tx LVDS internal loopback enable The bit is reflected by output signal ipp_digrf_lvds_lpbk_en.The internal loopback is not intended for board level functionality, so this feature should not be implemented. 0b - Tx LVDS normal mode enabled 1b - Tx LVDS internal loopback mode enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
10-6 —	Reserved
5 LVRXOP_TR	Used to enable or disable the on-chip receiver termination resistor in LFAST mode (applies to LVDS pad use for LFAST only): 0 Disable on-chip LFAST receiver termination 1 Enable on-chip LFAST receiver termination
4 —	Reserved
3 LVRXOP_BR	Used to set the bias current for the receiver in LFAST mode. It is recommended to always write 1 to this bit when using the LFAST interface. Writing 0 will allow for a small power savings during lower baud rates (applies to LVDS pad use for LFAST only): 0 Use for LFAST receiver baud rates less than the maximum baud rate. 1 Required for LFAST receiver maximum baud rate.
2 —	Reserved
1 —	Reserved
0 —	Reserved

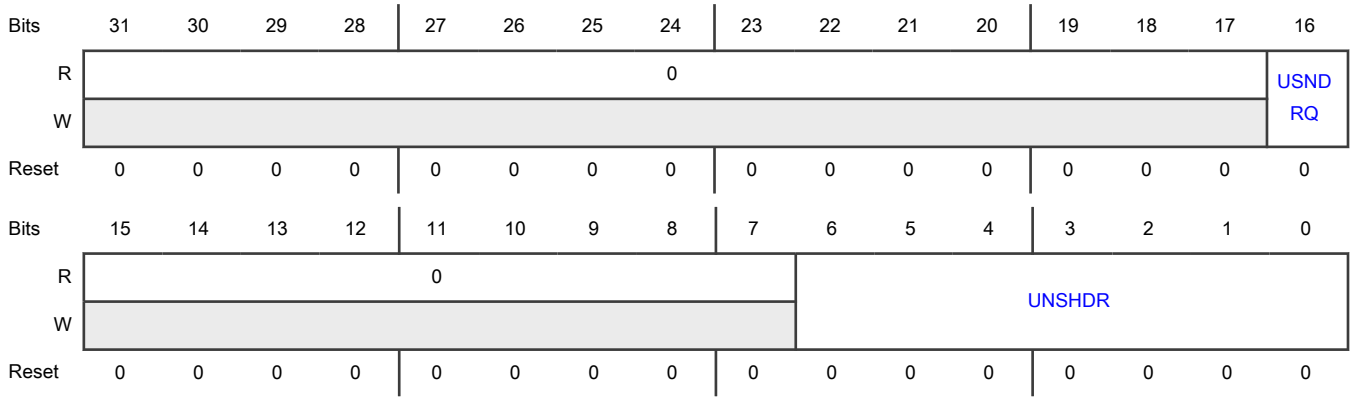
83.7.16 LFAST Unsolicited Tx Control (UNSTCR)

Offset

Register	Offset
UNSTCR	44h

Function
Defines the unsolicited transmit frame configuration.

Diagram



Fields

Field	Function
31-17 —	Reserved
16 USNDRQ	Tx Unsolicited send request Set by user software and cleared by system hardware. 0b - No valid Unsolicited frame exists 1b - Valid Unsolicited frame exists for transmission
15-7 —	Reserved
6-0 UNSHDR	Tx Unsolicited Message Header This field can only be written when LFAST_UNSTCR[USNDRQ] = 0

83.7.17 LFAST Unsolicited Tx Data Registers (UNSTDR0 - UNSTDR8)

Offset

For a = 0 to 8:

Register	Offset
UNSTDRa	48h + (a × 4h)

Chapter 84
Debug Subsystem

84.1 Introduction

This chapter discusses the debug and trace architecture of the chip that is based on the specifications provided in the *Arm® CoreSight™ SoC-400 Technical Reference Manual*. See References for a link to this document and to other related documentation available on the Arm website.

The chip architecture includes debug and trace modules. See Features for details on the debug and trace features that Cortex-M7 core clusters support.

The debug components that the Cortex-M7 core supports are accessible via the Arm DAP controller-based architecture. The DAP controller works in parallel with the system JTAGC. Both these controllers share the JTAG port and JTAG instruction set.

The system components are similar for different chips in the same family and include the primary core debug interfaces, the chip-level debug interfaces, and chip-level trace interfaces. The accelerator components include debug and trace circuits. These circuits are necessary for any application-specific accelerators required for the different application spaces that a chip supports. They vary from one chip to another and could include only trace components.

84.2 Interfaces supported in S32K396

The following interfaces are supported in S32K396:

- Cortex-M7_0 (CTI, DWT, BPU, ETM, ITM)
- Cortex-M7_1 (CTI, DWT, BPU, ETM, ITM)
- Cortex-M7_2 (CTI, DWT, BPU, ETM, ITM)
- Cortex-M0+
- HTM (CTI +DMA/EMAC TRACE)
- SWO
- TPIU
- ETF (5)
- FUNNELs (4)
- CTI (6)
- CTM (2)
- Timestamp
- MDM_AP
- SDA_AP
- HSE (MTB)

84.3 Block diagram

This figure illustrates the DAP architecture of the S32K396.

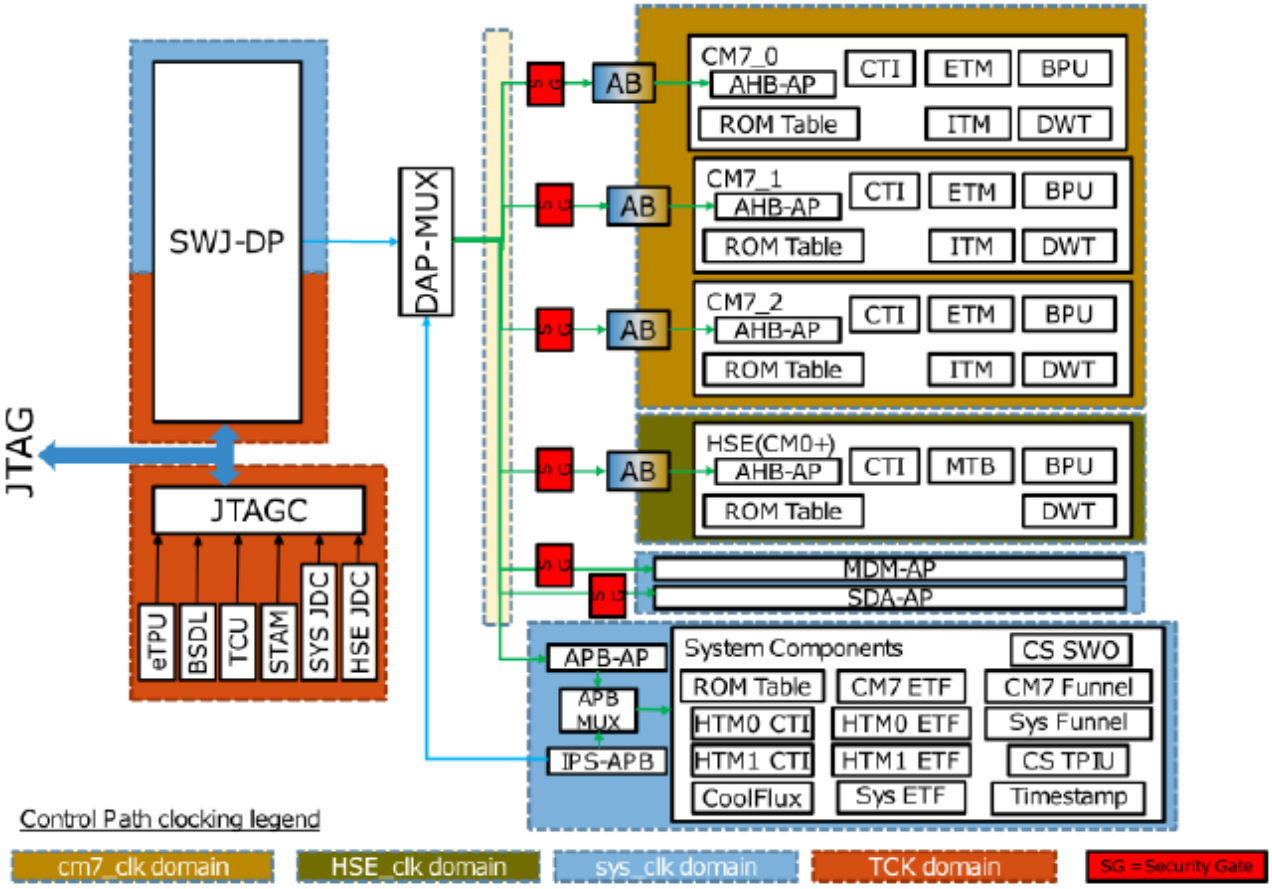

Figure 680. Detailed DAP architecture

NOTE

Debug components other than the Cortex-M0+ core are accessible through software path (CORE > AXBS > AIPS > DAPMUX > APs), that is, by directly specifying the memory mapped addresses without doing challenge response.

84.4 Features

This chip includes these features that support the functions listed under each feature type:

- Debug control
  - Is implemented via IEEE 1149.1-compliant JTAG
- Test control
  - Is implemented via IEEE 1149.1-compliant JTAG
  - Uses IEEE 1149.6 extension to IEEE 1149.1
- Trace interface
  - Includes four high-speed data pads and one clock pad @120 MHz (240 Mbit/s throughput per pad)
  - Includes 16 low-speed data pads and one clock pad @25 MHz (50 Mbit/s throughput per pad)
- Debug security

  - Includes a DAP/TAP interface that controls all debug features and is gated by Cortex M0+ JDC module
  - Includes security modes as described in the "Security" chapter
- Debugging and run control
  - Is implemented through stopping points, starting points, breakpoints, and watchpoints
  - Each Cortex-M7 core supports eight instruction comparators and a watchpoint unit having four watchpoints
- Trace source
  - Includes Cortex-M7:
    - ETM that provides instruction and data trace
    - ITM that provides DWT, time-stamping, and diagnostic information
- Cross-triggering support
  - Controls run-control options of cores based on other cores
  - Provides a matrix having connections to:
    - HTM via system CTI
    - All Cortex-M7 CPUs
- Ability to view and modify all memory-mapped areas that are not otherwise blocked—includes a system bus debug access port
- Performance monitoring of cores—implements a performance monitoring unit (PMU) on each Cortex core
- Safety
  - Supports monitoring of debug signals to avoid common mode faults
  - Allows checking of erroneous activation of debugging, especially if intrusive (for example, a CPU entering Debug state)
- Timestamps
  - Generates a timestamp bus for distribution to the trace sources
  - Includes a 48-bit binary timestamp bus
  - Clocks timestamp generator by a frequency of 160 MHz
- CoolFlux have APB connection to DAP and CTI interface.
- JTAGC interface for eTPU run control and debug register access (breakpoints, watchpoints).

84.5 Debug

84.5.1 TAP connectivity

This figure shows a detailed view of TAP connectivity. JTAG select, SWJ-DP, and JTAG-DP are parts of DAP.

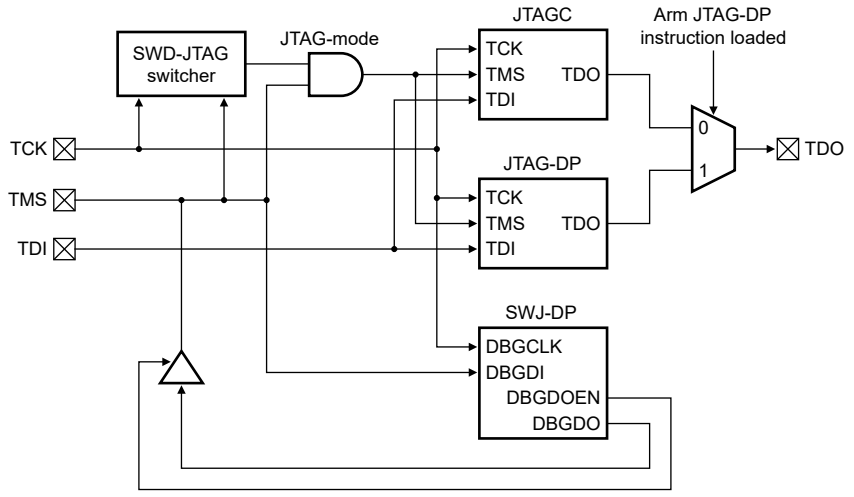

Figure 681. TAP connectivity

The debug port comes out of reset in a standard JTAG mode. It switches to another mode by using the change sequences. After the mode changes, unused debug pins can be reassigned to any of their alternative muxed functions.

JTAG-DP and JTAGC are connected in an overlay scheme and both have an Instruction Register (IR) length of 8 bits.

84.5.2 DAP TAP

DAP is an Arm component that provides multiple-master driving ports. A single external interface port accesses and controls these ports to provide system-wide debug.

The DAP Instruction Register (DAP IR) overlays with the system JTAG Instruction Register (JTAGC IR). Table 754 presents DAP instructions. In addition to the four codes listed in the table, DAP uses BYPASS, which is identical to JTAGC BYPASS and is therefore not shown in the table.

Table 754. DAP IR codes

Code	DAP IR
1111_1000b	ABORT
1111_1010b	DPACC
1111_1011b	APACC
1111_1110b	IDCODE

DAP offers an AHB master interface to access system buses. It also exports the internal DAP bus to extend the access ports. For more information on DAP TAP, see the *Arm Debug Interface Architecture Specification* document available in References.

In this chip:

- The AHB slave ports of all Cortex-M*x* cores provide debugger access to all memory units and registers in the system.
- The new pass-through approach allows the debugger to see a cache coherent view of the memory map for that core.
- The debugger must access the corresponding AHB_AP port to access the AHB-S port of that subsystem.
- XRDC controls system access.
- A core can access the debug components of another core through a DAPMUX to the bus interconnect.
- The exported DAP bus hosts AHB_AP and MDM_AP.

— MDM_AP hosts system-level JTAG status and control registers (see MDM_AP register descriptions). These registers can be used for cross triggering, synchronized debug, and other miscellaneous control and status functions.

— APB_AP uses an APSEL value of 1h to access any APB-mapped debug modules.

Table 758 describes the access addresses of APB-mapped debug modules. The value of the DAP select signal in the APSEL field of SWJ-DP's Select register selects the access ports in the DAP. Table 755 shows APSEL decoding.

Table 755. DAP master address mapping

DAP master #	DAP component	DAPBUS base address (access from debugger) [1]	System memory map address (access from cores)	
			Page number	Base address
0h	Reserved	0000_0000h	0	4025_0000h
1h	APB_AP to all APB-mapped debug modules (for example, ETFs, HTM, trace funnels, etc)	0100_0000h	0	4025_0100h
2h	Reserved	0200_0000h	0	4025_0200h
3h	AHB_AP to Cortex-M7_2 debug modules and chip system memory map	0300_0000h	0	4025_0300h
4h	AHB_AP to Cortex-M7_0 debug modules and chip system memory map	0400_0000h	0	4025_0400h
5h	AHB_AP to Cortex-M7_1 debug modules and chip system memory map	0500_0000h	0	4025_0500h
6h	MDM_AP	0600_0000h	0	4025_0600h
7h	SDA_AP	0700_0000h	0	4025_4700h
8h—FFh	Reserved (default AP response)	—	—	—

1. For example, 4000_XXYYh address is provided when accessing access ports (APs) via the debugger. Here, XX shows the AP select number and YY shows the address to be accessed. If you access SDA_AP via the debugger on 80h, you must provide the address 4000_0780h.

NOTE

Accessing SDA_AP simultaneously from the core and the debugger is prohibited. If you try to do so, you may receive unpredictable responses to core-initiated transactions (for example, incorrect data read, a failed attempt to write to the register, or a transfer error). Debugger-initiated transactions proceed correctly.

84.5.3 System JTAGC

JTAGC connects in parallel with the TAP controller (JTAG-DP of DAP), which has an IR length of 8 bits. The JTAGC IR codes overlay the ones of the DAP controller. DAP uses four instructions and JTAGC uses the remaining ones. The TAP outputs (TPOs) are multiplexed based on the selected IR code. This chip is fully JTAG-compliant and appears as a single TAP to the JTAG chain.

This table shows the JTAGC IR codes. The instructions that are used by Arm DAP TAP are shown in Table 754.

Table 756. JTAG instructions for JTAGC

84.5.3.1 Chip JTAG/Target ID

S32K396 includes a unique JTAG ID, which must be changed when instantiated with a different die in an SiP. The table shows the JTAGC ID for this chip.

Table 757. JTAG/Target ID

Chip	PRN	DC	PIN	MIC	IDCODE ID	JTAG ID	Target ID
S32K396	1	26h (38d)	156h (342d)	Eh (14d)	1	1995_601Dh	1995_601Dh

84.5.3.2 JDC

JDC allows you to access two 32-bit data registers by using the JTAG interface and by software running on one of the CPUs in the chip. These registers exchange data between an internal CPU and an external debug tool.

84.5.4 Peripheral IPG debug implementation

S32K396 is a multi-core chip. Any core can control a peripheral instance individually. You define the core's control over a peripheral during application development.

For peripheral halt, all individual cores have the same capability and are gated by a dedicated MDM_AP core halt register field. For more information, see the configurations defined in MDM_AP register descriptions.

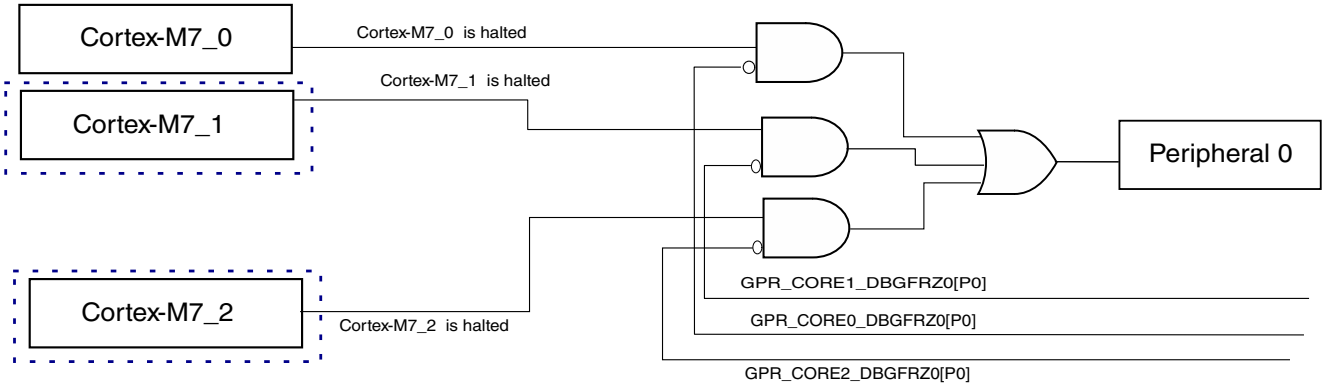

Figure 682. Peripheral IPG debug implementation

84.5.5 Application debugging

This section covers the following two cases:

- Case 1: Debugger connected—application debugging from the first instruction
- Case 2: Debugger not connected

84.5.5.1 Application debugging from first instruction

This chip supports debugging from the first instruction on system power-up, destructive reset, functional reset, and standby exit. However, by default, debugging from the first instruction is disabled.

The next figure shows the timing diagram of application debug implementation from first instruction on system power-up or destructive reset.

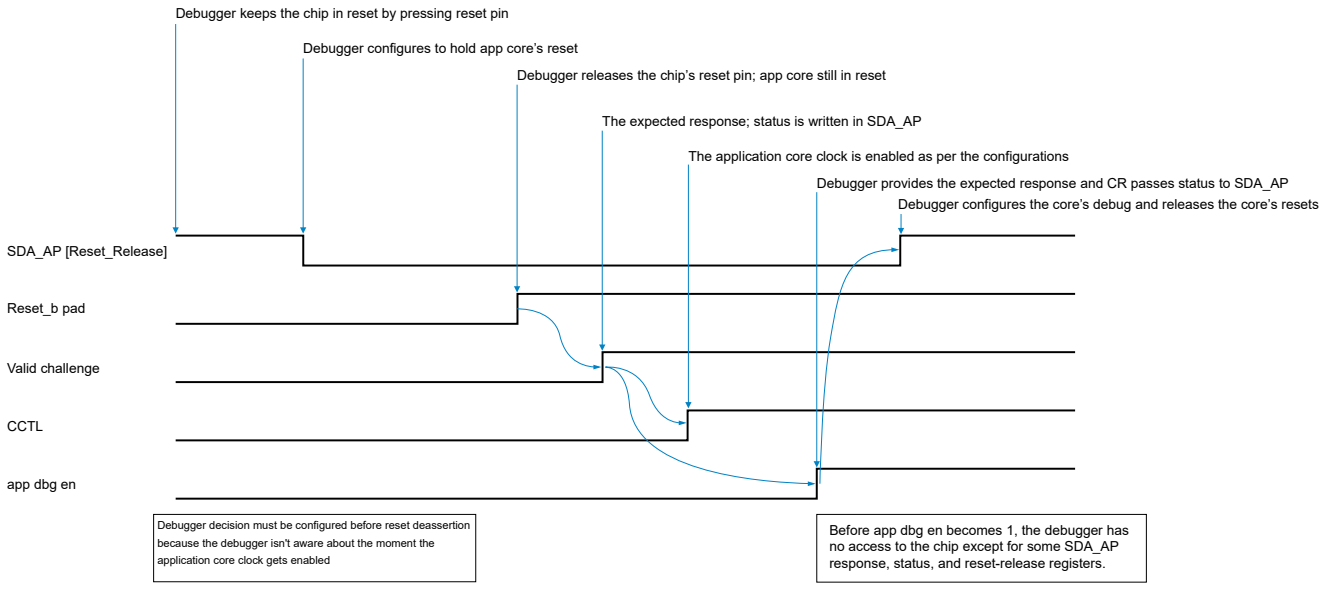

Figure 683. Application debug implementation from first instruction

These are the steps involved in enabling application debug from the first instruction on system power-up or destructive reset:

1. After the reset is applied, the debugger provides an option to debug from the first instruction. To do this:

a. Write 1 to SDAAPRSTCTRL[RSTRELTLCM70] and SDAAPRSTCTRL[RSTRELTLCM7].

b. Set the reset value of Reset Control (SDAAPRSTCTRL).

2. Cortex M0+ starts after the reset pin is released.
3. Debugger challenge-response (CR) starts.
4. Cortex-M7_0 and Cortex-M7_1 remain in reset until MC_ME's PRTN0_CORE0_PCONF[CCE] field becomes 1 for Cortex-M7_0 and PRTN0_CORE1_PCONF[CCE] field becomes 1 for Cortex-M7_1.
5. When BAF or FW writes 1 to MC_ME's PRTN0_CORE0_PCONF[CCE] field for Cortex-M7_0 and to PRTN0_CORE1_PCONF[CCE] field for Cortex-M7_1, and the debugger CR has passed:
   - If the value of SDAAPRSTCTRL[RSTRELTLCM71] and SDAAPRSTCTRL[RSTRELTLCM70] is 1 for their respective cores, the debugger configures the core debug registers and then enables these fields that start the code execution.

To debug from the first instruction during the low-power debug protocol, the debugger:

1. Writes 0 to SDAAPRSTCTRL[RSTRELTLCM71] and SDAAPRSTCTRL[RSTRELTLCM70] for their respective cores.
2. Writes 1 to MDMAPWIRREL[WTRSTRGM].

84.5.5.2 Debugger not connected

If the debugger is not connected, the value of the DBGPWRUP_ACK signal is 0 as there is no DBGPWRUP_REQ. This results in the following scenario:

1. The booting core writes 1 to MC_ME's PRTN0_CORE0_PCONF[CCE] field for Cortex-M7_0 and to PRTN0_CORE1_PCONF[CCE] field for Cortex-M7_1.
2. The application core starts running. In case of Lock-step mode, the checker core executes the same code after a delay of two cycles.

84.5.6 Debugger considerations while flash program/erase

The flash programming can be done by application cores as well as debugger. The debugger can program/erase flash using either of the following two options:

1. Loading the program/erase code to SRAM from the debugger and then executing the program/erase sequence by application code from SRAM.
   - Debugger is connected and authenticated.
   - The debugger loads the code in the form of application binary image into the on-chip SRAM.
   - The debugger then initiates the application core to execute the binary from SRAM.
2. Debugger executing the program/erase sequence.
   - Debugger is connected and authenticated.
   - The debugger then initiates the flash programming by reading/writing the registers involved and following the program/erase sequence.

First option is the recommended because of less execution time. In second option, the debugger is the master and since the debug interface is serial, the execution takes more time.

In some cases, you might experience flash program/erase failure due to flash watchdog timeout when debugger executes the flash program/erase sequence due to the serial interface. Therefore, it is recommended to use the first option. In case second option is required, it should be performed in reduced clocking options (Option E and E2 only. For details, refer to the **Clocking details** section in the **Clocking** chapter).

84.5.7 SWJ-DP sequence for debug authentication

To perform the SWJ-DP sequence for debug authentication, the debugger:

1. Polls the AUTHSTTS[CHALRDY] field until it indicates the challenge status.
2. Reads Key Challenge (KEYCHAL0 - KEYCHAL7) if the challenge is valid and creates an authenticated 256-bit response key.
3. Writes a 256-bit response key to Key Response (KEYRESP0 - KEYRESP7).
4. Indicates that the response is ready by configuring AUTHCTL[HSEAUTHREQ].
5. Checks the status of Authentication Status (AUTHSTTS) to evaluate if the operation is successful.

   If the authentication process is successful and the debugger has write access to Debug Enable Control (DBGENCTRL), the challenge or response is considered successful too.

NOTE

SDA_AP supports challenge and response based on both JTAG and SWJ-DP modes. See SDAAPGENCTRL0[JTAG_CR_EN] for details.

84.6 APB memory map

You can access the debug registers via the APB_AP bus. The next table shows all the addresses for the CoreSight APB components and the addressing used for accessing the DAP components via the memory interface. You can also access all APB registers from the processing cores.

Table 758. APB components mapping

Debug APB component	APBIC base address (access from debugger)	System memory map address (access from cores)		Memory allocation (KB)	APB-AP0 slot number
		Page number	Base address		
APB_AP ROM table	F8h	0	4024_00F8h	4	APBIC base
Funnel 0	1000h	0	4024_1000h	4	0
Funnel 1	2000h	0	4024_2000h	4	1

84.7 Trace

84.7.1 Trace modules and connectivity

The Trace subsystem:

- Combines trace data from all internal clients that generate trace information
- Includes a 32-bit TPIU
- Includes these components:
  - ATB
  - ATBR
  - CSTF
  - Debug APB
  - ETF
  - TPIU

Multiple options for trace output allow parallel tracing. Trace information can be read from the trace interface or the DAP interface, and traces can be alternatively read out from ETF at a slow speed via APB_AP. Table 759 shows EFT sizes.

Table 759. ETF sizes

FIFO	Memory interface data width (in bits)	Size (KB)
Cortex-M7 ETM/ITM cluster ETF	32	2
Cortex-M7 ETMD cluster ETF	64	2
HTM ETF	32	1
Shared system ETF	32	4
ETPU ETF	32	1

NOTE

- The DMA-HTM trace supports four words at 80 MHz. For HTM trace, both DBGENCTRL[GSPNIDEN] and DBGENCTRL[GSPIDEN] must be 1.
- Enabling any one of data trace causes overflow inside ETM and trace packets get dropped. Enabling instruction trace of both the core simultaneously does not cause any overflow.

Control (MDMAPCTL) provides fields to override the speed control (see Table 760 for details) from some of the trace sinks (and TPIU). The complete trace pipeline bandwidth is limited by the slowest sink component. The default settings of these fields allow maximum bandwidth for the TPIU to trace. When tracing to memory (if supported), the fields may need to be changed.

Table 760. Trace output overrides

Trace destination	SWO_override	TPIU_override
TPIU	1	0

The trace sources of the chip are the cores and their related modules. Trace funnels exist for all possible trace clients. For more information on the various components in the trace bus connectivity, see the *CoreSight Components Technical Reference Manual* (available in References). See Table 761 for details on funnel assignments.

The ATBR is integrated to send a shared funnel output across TPIU. This figure illustrates the chip's detailed trace architecture.

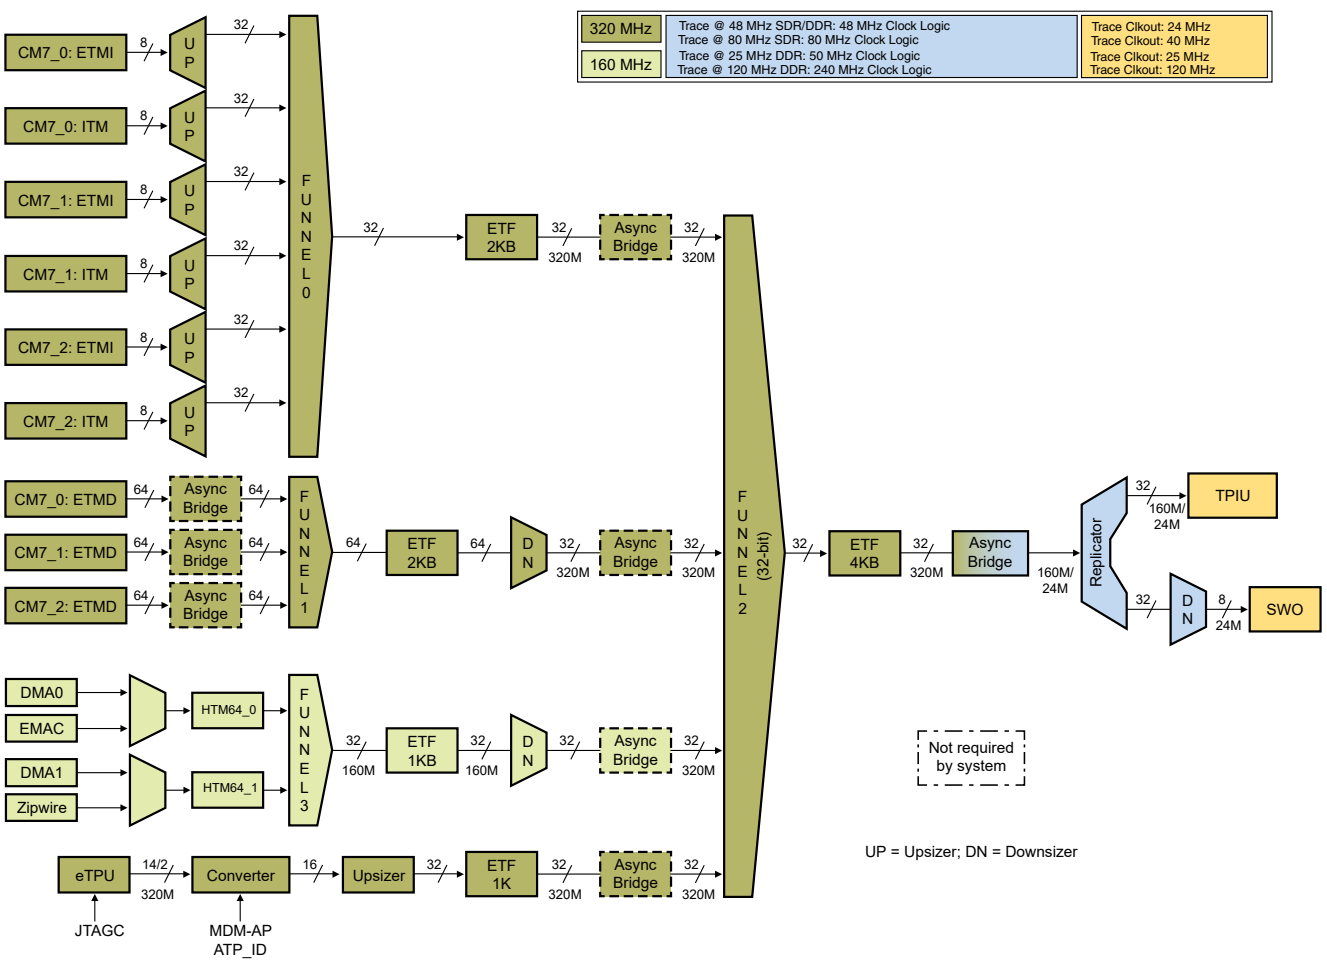

Figure 684. S32K396 detailed trace architecture

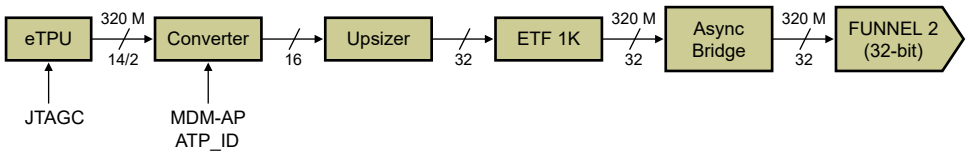

Figure 685. eTPU Trace

Table 761. Funnel assignments

Funnel	Port	Input	Frequency
0	0	CM7_0 ETMI	320 MHz
0	1	CM7_0 ITM	320 MHz
0	2	CM7_1 ETMI	320 MHz
0	3	CM7_1 ITM	320 MHz
0	4	CM7_2 ETMI	320 MHz
0	5	CM7_2 ITM	320 MHz
1	0	CM7_0 ETMD	320 MHz
1	1	CM7_1 ETMD	320 MHz
1	2	CM7_2 ETMD	320 MHz
2	0	CM7 Instruction ETF through an Async Bridge	320 MHz
2	1	CM7 Data ETF through an Async Bridge	320 MHz
2	2	HTM ETF through an Async Bridge	160 MHz
2	3	eTPU through asyncbridge	320 MHz
3	0	HTM_0	160 MHz
3	1	HTM_1	160 MHz

84.7.1.1 Chip's bus trace client

This chip include a bus trace client.

HTM provides the address and data trace information about AXBS buses. The information from an HTM can be used with the debugger to enable easy, accurate debugging on AXBS-based embedded systems. The chip implements an HTM64 configuration to trace 64-bit AXBS masters in the system. To simplify the implementation, instead of tracing the individual ports of various AXBS masters and slaves, which may be running at different frequencies, HTM64 snoops the AXBS crossbar master ports that are all synchronous with a 160 MHz system clock. This table provides details related to the HTM input connectivity.

Table 762. HTM connections

HTM64 port	AHB crossbar port
HTM_0_BUSSELECT0	M0 AXBS_Lite XBIC (DMA)
HTM_0_BUSSELECT1	M0 AXBS_Lite XBIC (Ethernet)

Table continues on the next page...

Table 762. HTM connections (continued)

HTM64 port	AHB crossbar port
HTM_1_BUSSELECT0	M1 AXBS_Lite XBIC (DMA)
HTM_1_BUSSELECT1	M1 AXBS (Zipwire)

84.7.1.2 TPIU interface

A standard 16-bit parallel TPIU is integrated into the debug subsystem. This chip generate the trace via the trace port.

To prevent instruction trace from being dropped in a multi-core environment, a TPIU throughput of 55.2 MB/s or higher must be maintained. You could use these pin and frequency combinations:

- Four high-speed data + one clock pads @120 MHz (240 Mbit/s throughput per pad equivalent to 30 MB/s) resulting in total 120 MB/s
- 16 low-speed data + one clock pads @25 MHz (50 Mbit/s throughput per pad equivalent to 6.25 MB/s) resulting in total 100 MB/s

This chip can support at least 56 MB/s of trace throughput on the TPIU interface.

Table 763. Throughput

Core	Throughput value
Cortex-M7_0	27.6 MB/s
Cortex-M7_1	27.6 MB/s
Cortex-M7_2	27.6 MB/s
Total	82.8 MB/s

84.7.1.3 TPIU flush

To allow the chip to enter Standby mode, software executes an WFI instruction indicating Standby entry. When the chip enters this mode, MC_RGM asserts a trace flush request to the TPIU and waits for a trace flush done signal from the TPIU before requesting MC_PCU to proceed. The TPIU and debug infrastructure clocks can be gated after this. Because the TPIU is sourced from system clock, the clock must not be gated until this point.

84.7.1.4 Trace through reset

All debug and trace components (HTM, ETM, ETF, and so on) are on destructive reset. When tracing through reset, the clock switches from PLL to FIRC. It is recommended to preserve the following pad configurations across reset, which are performed through MDMAPCTL[DBGRSTFASTPAD] and MDMAPCTL[DBGRSTSLOWPAD]:

- Four high-speed data + one clock pads @120 MHz (240 Mbits/s throughput per pad) totaling 120 MB/s
- 16 low-speed data + one clock pads @25 MHz (50 Mbits/s throughput per pad) totaling 100 MB/s

The implementation involves writing 1 to MDMAPCTL[DBGRSTFASTPAD] or MDMAPCTL[DBGRSTSLOWPAD], depending on which set of trace pads you need to enable. These fields also control:

- The trace pad mux.
- The "obe" of the trace pads, which, if configured, is retained over functional reset because the reset is controlled using the above-mentioned corresponding fields.

84.7.2 Trace assignments

ETF combines trace information from multiple clients into a single stream of trace data. This table shows the CoreSight funnel input assignments.

Table 764. CoreSight funnel assignments

Instance name	Port assignment
Funnel 0 (CSTF0)	Cortex-M7_0 ETMI
	Cortex-M7_0 ITM
	Cortex-M7_1 ETMI
	Cortex-M7_1 ITM
	Cortex-M7_2 ITM
	Cortex-M7_2 ETMI
Funnel 1 (CSTF1)	Cortex-M7_0 ETMD
	Cortex-M7_1 ETMD
	Cortex-M7_2 ETMD
Funnel 2 (CSTF2)	Funnel 0
	Funnel 1
	Funnel 3
	eTPU through asyncbridge
Funnel 3 (CSTF3)	HTM64 (DMA0)
	HTM64 (DMA1)

84.8 Embedded cross trigger (ECT)

ECT allows multi-core run control and trace cross-triggering, such as synchronous stop-start for all cores or trigger trace on a trigger event from another core or module. See the *CoreSight Components Technical Reference Manual* (available in References) for detailed information on ECT.

ECT architecture involves CTMs and CTIs. The CTIs provide a cross-triggering interface between the cores and other debug and trace modules. The channels of these CTIs are interconnected using CTMs, as shown in this figure.

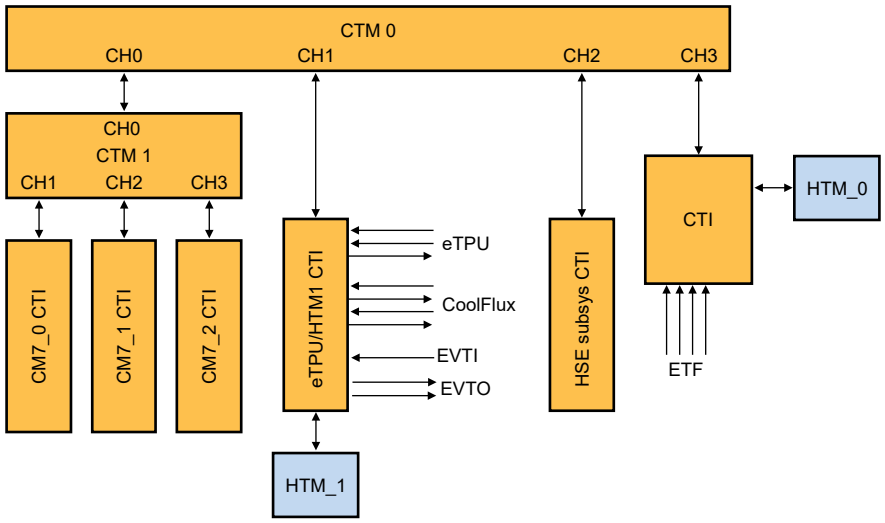

Figure 686. ECT

84.8.1 CTI assignments

6 CTIs are used for cross triggering the following components in multicore deivces: CM7_0,CM7_1,CM7_2, HSE subsystem and HTM x2

Table 765. CTI assignments

CTI instance	Trigger number	Trigger in	Trigger out
CTI1_COOLFLUX_ETPU_HTM1	7	EVTI	EVTO_1[1]
	6	Break_out (ETPU)	EVTO_0[1]
	5	Event_Out (ETPU)	Event_In (ETPU)
	4	Break_in (COOLFLUX)	Break_Out (COOLFLUX)
	3	Restart_in (COOLFLUX)	Restart_out (COOLFLUX)
	2	HTM1 External Trigger input 1	HTM1 External Output Event 1
	1	HTM1 External Trigger input 0	HTM1 External Output Event 0
	0	Reserved	HTM Trigger
CTI0_HTM_ETF	7	Reserved (grounded)	Reserved (no connection)
	6	ETF3 full trigger indication	ETF3 Trigger input
	5	ETF2 full trigger indication	ETF2 Trigger input
	4	ETF1 full trigger indication	ETF1 Trigger input
	3	ETF0 full trigger indication	ETF0 Trigger input
	2	HTM trigger output 2	HTM trigger input 2
	1	HTM trigger output 1	HTM trigger input 1
	0	Reserved	HTM Trigger input 0
CTI_Cortex-M7_0	7	ETM event output 3	Processor restart
	6	ETM event output 2	ETM event input 3
	5	ETM event output 1	ETM event input 2
	4	ETM event output 0	ETM event input 1
	3	DWT comparator output 2	ETM event input 0
	2	DWT comparator output 1	Interrupt request 1
	1	DWT comparator output 0	Interrupt request 0
	0	Processor halted	Processor debug request
CTI_Cortex-M7_1	7	ETM event output 3	Processor restart
	6	ETM event output 2	ETM event input 3
	5	ETM event output 1	ETM event input 2
	4	ETM event output 0	ETM event input 1

Table continues on the next page...

Table 765. CTI assignments (continued)

CTI instance	Trigger number	Trigger in	Trigger out
	3	DWT comparator output 2	ETM event input 0
	2	DWT comparator output 1	Interrupt request 1
	1	DWT comparator output 0	Interrupt request 0
	0	Processor halted	Processor debug request
CTI_Cortex-M7_2	7	ETM event output 3	Processor restart
	6	ETM event output 2	ETM event input 3
	5	ETM event output 1	ETM event input 2
	4	ETM event output 0	ETM event input 1
	3	DWT comparator output 2	ETM event input 0
	2	DWT comparator output 1	Interrupt request 1
	1	DWT comparator output 0	Interrupt request 0
	0	Processor halted	Processor debug request

1. eTPU triggers need glue logic for CTI compatibility. The Nexus Event in/out signals are pulse signals. CTI needs to be configured for pulse.

NOTE

Additional configuration is required for CoolFlux.

84.9 Low-power debug handshake protocol

The debugger must perform this sequence to enter or exit Standby mode, if the debugger handshake is enabled:

1. Power on DAP.

   The debugger connection is established.

2. Configure the Debug subsystem for the relevant operations.
3. Write 1 to MDMAPWIREN[LWPWREN] to gate entry into Standby mode with the debugger handshake. If TPIU is disabled, write 1 to MDMAPWIREN[LWPRSTPRVT] too.
4. Disable POR_WDG for monitoring the entry to or exit from Standby mode by writing 1 to DCM's DCMRWP1[8] field. This is required for low-power debug handshake because debugger configurations can be more time consuming than the POR_WDG threshold levels and can raise a false POR_WDG event.
5. Write 1 to DCMRWF1[STANDBY_IO_CONFIG] in the Device Configuration Module (DCM). This causes padkeeping to be disabled on standby entry itself without any software dependency. This is needed in case of low-power debug since otherwise the padkeeping on TDO would result in no debugger communication. In other cases, DCMRWF1[STANDBY_IO_CONFIG] should be configured as 0 before standby entry.
6. Initiate entry into Standby mode. See the "Power Management" chapter for the Standby mode entry sequence and configurations.
7. Identify whether the low-power debug is enabled on the low-power entry.
   - If low-power debug is enabled and TPIU is enabled too, trace flush starts, and the debugger acknowledges the following:
     - Low-power debug traces
     - DAP-related configuration reception and context saving

After this, the chip enters Standby mode.

- If TPIU is disabled:
  - The debugger acknowledges DAP-related configuration reception and context saving by writing 1 to MDMAPWIRREL[PRVNTRSTRGM].

    After this, the chip enters Standby mode.
- If low-power debug is disabled, the chip enters Standby mode without waiting for debugger acknowledgment.

On any wakeup event, the chip starts the Standby mode exit sequence described in the "Power Management" chapter. After the chip exits Standby mode, the debugger connection is restored. By this time, the debugger is already aware that it has enabled the low-power debug handshake. In this case, the debugger must poll MDMAPSTTS[DESTRST] to check whether:

- The debug infrastructure is out of reset.
- The DAP connection can be established.

After DAP is powered on (the debugger connection is established), the debugger:

a. Reconfigures the debug and trace attributes using the fields in DBGENCTRL

b. Writes 1 to MDMAPWIRREL[WTRSTRGM] after the debugger trace context is restored

   The chip exits Standby mode.

   If low-power debug is not configured, the chip exits Standby mode without waiting for the debugger to write to MDMAPWIRREL[WTRSTRGM].

8. Reconfigure the debug and trace configuration in SDA_AP register descriptions after the chip exits Standby mode.

NOTE

If the chip wakes up from Standby mode through pad reset, the debugger must perform a CR again.

84.10 Development Trigger Semaphore (DTS)

The MDM-AP shall implement the DTS option with 128 triggers, 4 start-up register and 1 information register.The MDM-AP will include similar functionality to the Development Trigger Semaphore (DTS).

DTS Register access

A summary of accesses to all 32-bit DTS registers. Only proper 32-bit accesses are valid. The effects of write accesses that are not 32 bits are not defined. External/Internal determine by memory space used to access the register.

- SIUL Pin configuration for MSCR19
- DTS enable from External access
- Write on DTS Semaphore register through Internal access
- EVTO trigger will be written via DTS Semaphore register with DTS enable from external access.

NOTE

Internal Access: Access by Software and External Access: Access by Debugger.

Table 766. DTS Register access

Register	32-bit read		32-bit write	
	External Access	Internal Access	External Access	Internal Access
DTS_ENABLE	Data	Data	Data	No effect
DTS_STARTUP	Data	Data	Data	No effect

Table continues on the next page...

Table 766. DTS Register access (continued)

Register	32-bit read		32-bit write	
	External Access	Internal Access	External Access	Internal Access
DTS_STARTUP_B	Data	Data	Data	No effect
DTS_STARTUP_C	Data	Data	Data	No effect
DTS_STARTUP_D	Data	Data	Data	No effect
DTS_SEMAPHORE	Data and Clear	Data	No effect	Bit OR
DTS_SEMAPHORE_B	Data and Clear	Data	No effect	Bit OR
DTS_SEMAPHORE_C	Data and Clear	Data	No effect	Bit OR
DTS_SEMAPHORE_D	Data and Clear	Data	No effect	Bit OR

NOTE

A read of the Semaphore registers by the external access is destructive and clears all bits in the registers.

The DTS / CTI implements two external inputs (EVTI) to enable triggering of debug events (e.g. breakpoints and watchpoints.

The DTS / CTI implements two external outputs (EVTO) to enable external signaling of debug events (e.g. breakpoints and watchpoints).

DTS/CTI external triggering implementation is shown in the diagram below:

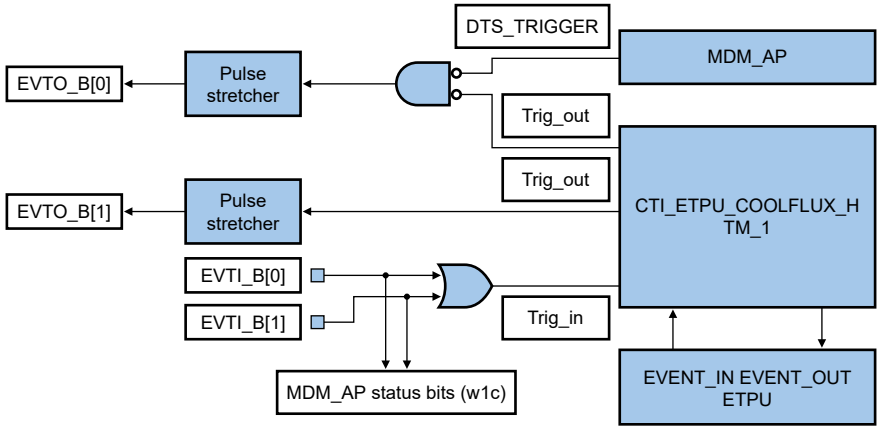

Figure 687. DTS - CTI Implementation

84.11 Debug resets

The debug subsystem follows this sequence on the source of reset:

1. POR resets the complete debug logic.
2. The destructive reset resets all types of debug logic except JTAGC.

Conversely, the debug subsystem can generate a system reset using these mechanisms:

- System destructive reset defined in Control (MDMAPCTL) that allows the debugger to provide the destructive reset to the system. The debugger loses connection to the system with this reset.
- System functional reset defined in Control (MDMAPCTL) that allows the debugger to hold the system in functional reset.

To program various debug registers, the functional clocks must be enabled. All debug and trace components must be on destructive reset.

84.12 Pin interface

This table presents a summary of functional and power pins that are used for debugging purposes.

Table 767. Pin interface

Pin type	Pins	Number of pins (balls)[1]	Nominal voltage
Functional JTAG	JCOMP, TCK, TMS, TDI, TDO	Five (only TDI and TDO can be multiplexed with GPIO or other functions)	3.3 V, 5 V
Functional trace pins (parallel trace)	TRACE_CLK	One	3.3 V, 5 V
	TRACE_D[15:0]	16	3.3 V, 5 V
Ground	VSS	See the IOMUX file attached to this document for information on the number of VSS pins in various packages.	0 V

1. The terms pins and balls are used interchangeably. Some chip packages include pins and others include balls.

84.12.1 Debug port and pin descriptions

The pads to which the debug signals are mapped operate using the JTAG functionality out of reset but can later be reassigned to their alternate functionalities. TDI and TDO can operate as alternate GPIO functions. See this table for pin assignments in different modes.

Table 768. Debug port pins

Pin name	JTAG debug port		Internal pullup or pulldown logic
	Type	Description	
TMS	I/O	JTAG test mode selection (TMS)	Pullup
TCK/SWCLK	I	JTAG test clock (TCK)	Pulldown
TDI	I	JTAG test data input (TDI)	Pullup
TDO/TRACESWO	O	JTAG test data output (TDO)	Not connected

84.12.2 Trace port pin descriptions

This chip generates trace via TPIU that transmits the trace data out of the chip over a parallel trace port. The trace port consists of an ETM trace clock and 16 parallel trace data outputs. The Arm optional trace port control (TRACECTRL), debug request (DBGRQ), and debug acknowledge (DBGACK) signals are not implemented.

Table 769. Trace output port pins

Pin name	Description
TRACE_DATA00	ETM parallel trace data output 01
TRACE_DATA01	ETM parallel trace data output 01
TRACE_DATA02	ETM parallel trace data output 02
TRACE_DATA03	ETM parallel trace data output 03
TRACE_DATA04	ETM parallel trace data output 04
TRACE_DATA05	ETM parallel trace data output 05
TRACE_DATA06	ETM parallel trace data output 06
TRACE_DATA07	ETM parallel trace data output 07
TRACE_DATA08	ETM parallel trace data output 08
TRACE_DATA09	ETM parallel trace data output 09
TRACE_DATA10	ETM parallel trace data output 10
TRACE_DATA11	ETM parallel trace data output 11
TRACE_DATA12	ETM parallel trace data output 12
TRACE_DATA13	ETM parallel trace data output 13
TRACE_DATA14	ETM parallel trace data output 14
TRACE_DATA15	ETM parallel trace data output 15
TRACE_CLK	ETM parallel trace clock output

NOTE

By default, Rx pins float and are not pulled inside. An internal active pulldown logic exists only when you enable Rx via software (IBE).

84.13 Timestamp distribution network

The timestamp distribution network uses CoreSight timestamp components to generate a 48-bit timestamp value for the trace sources, as shown in the next figure. The CoreSight timestamp generator generates a 64-bit counter value, but only the least significant 48 bits are distributed to the trace sources. A 7-bit narrow timestamp is derived from the 48-bit timestamp and distributed to the trace client, where a decoder regenerates the 48-bit timestamp. The generator must be programmed, and you could find the related programming information in the *CoreSight Components Technical Reference Manual* (available in References).

This chip supports 48-bit timestamping. The generator operates at a frequency of 160 MHz and gives a 64-bit timestamp value. The Cortex-M7_0 and Cortex-M7_1 cores operate at a frequency of 160 MHz.

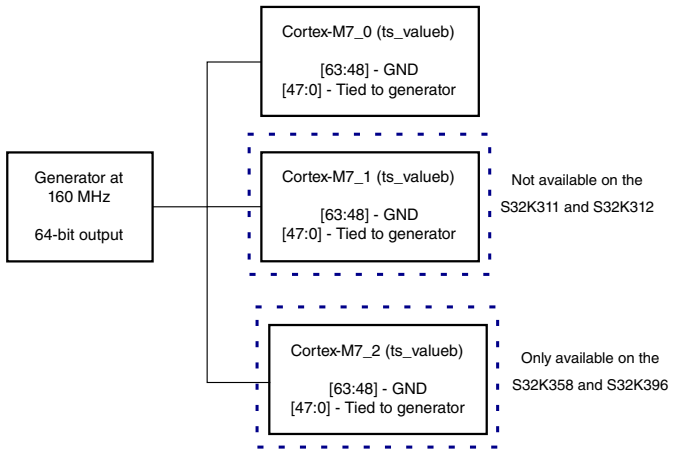

Figure 688. Timestamp distribution network

84.14 Peripheral debug freeze register descriptions

Implement the logic provided in this section for each peripheral instance supporting the debug operation.

NOTE

Debug freeze is enabled for all the peripherals so that as soon as the core halts, peripherals can be frozen to support debugging from the first instruction.

For register details, refer to the following registers in the Device Configuration Module (DCM):

- Read Write GPR On Destructive Reset Register (DCMRWD6)
- Read Write GPR On Destructive Reset Register (DCMRWD7)
- Read Write GPR On Destructive Reset Register (DCMRWD8)
- Read Write GPR On Destructive Reset Register (DCMRWD9)

84.15 MDM_AP register descriptions

The debugger has access to the status and control elements implemented as registers in MDM_AP, which is selected by APSEL (6h) on the DAP bus. These registers provide additional control and status information for typical debug, cross-triggering, and run-control scenarios. Also, the register fields provide a way for the debugger to get the updated status of the core without initiating a bus transaction across the crossbar switch, thus remaining less intrusive during a debug session.

MDM_AP is accessible as DAP (see DAP TAP for details).

NOTE

eTPU is supported for S32K396 only.

11-3 —	Reserved
2 FUNCRST	Functional Reset Indicates the system reset state. 0b - Not in functional reset 1b - In functional reset
1 DESTRST	Destructive Reset Indicates the system reset state. 0b - Not in destructive reset 1b - In destructive reset
0 —	Reserved

84.15.3 Control (MDMAPCTL)

Offset

Register	Offset
MDMAPCTL	4h

Function

Allows the debugger:

- To give the destructive reset to the system. A system destructive reset enables this. The debugger also loses connection to the system with this reset.
- To hold the system in functional reset. A system functional reset enables this.

NOTE

The trace functionality on trace pins is selected with this register and is retained across the functional reset.

NOTE

For lockstep cores, both bits for the core and its checker core need to be set together. Bits 18 and 19 should be written in conjunction always. Bits 16 and 17 should be written in conjunction if lockstep is enabled for cores 0 and 1.

Diagram

27-23 —	Reserved
22 SWOOVRD	SWO Override Indicates if the SWO trace response is overriden. When TPIU is not the selected trace sink target, you must override the trace response.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Not overridden, and SWO generates the trace response 1b - Is overridden
21 —	Reserved
20 TRIUOVRD	TPIU Override Indicates if TPIU trace response is overridden. When TPIU is not the selected trace sink target, you must override the trace response. 0b - Not overridden, and TPIU generates the trace response 1b - Is overridden and asserted
19 CM7_2_CHK_CORE_ACCESS	Debugger Access To Application Cortex-M7_2 checker core Indicates if debugger access to Cortex-M7_2 checker core across the functional reset phase is supported. After programming the Cortex-M7_2 core debug logic, the debugger can write 1 to this field. Because of this, the clock gating control for CLK and FCLK of Cortex-M7_2 checker core shifts to CCTL. 0b - Supported 1b - Not supported
18 CM7_2_CORE_ACCESS	Debugger Access To Application Cortex-M7_2 Indicates if debugger access to Cortex-M7_2 across the functional reset phase is supported. After programming the Cortex-M7_2 core debug logic, the debugger can write 1 to this field. Because of this, the clock gating control for CLK and FCLK of Cortex-M7_2 shifts to CCTL. 0b - Supported 1b - Not supported
17 CM7_1_CORE_ACCESS	Debugger Access To Application Cortex-M7_1 Indicates if debugger access to Cortex-M7_1 across the functional reset phase is supported. After programming the Cortex-M7_1 core debug logic, the debugger can write 1 to this field. Because of this, the clock gating control for CLK and FCLK of Cortex-M7_1 shifts to CCTL. 0b - Supported 1b - Not supported
16 CM7_0_CORE_ACCESS	Debugger Access To Application Cortex-M7_0 Indicates if debugger access to Cortex-M7_0 across the functional reset phase is supported. After programming the Cortex-M7_0 core debug logic, the debugger can write 1 to this field. Because of this scenario, the clock gating control for CLK and FCLK of Cortex-M7_0 shifts to CCTL. 0b - Supported 1b - Not supported

Table continues on the next page...

Table continued from the previous page...

Field	Function
15 POR_WDG_DIS	Power Watchdog Status When a 0 is written to this field, the power watchdog is disabled in case of MDM FUNC reset or JTAG reset. When a 1 is written to this field, the power watchdog is enabled in case of MDM FUNC reset or JTAG reset. 0b - Power watchdog is disabled 1b - Power watchdog is enabled
14 —	Reserved
13 DBGRSTFASTPAD	Debug Over Reset Via Fast Pads Enables or disables trace via fast pads. If enabled, the trace pads have trace over functional reset feature enabled. This field does not take care of the clock configuration. **NOTE** Pad configuration must be DSE = 1b and SRE = 0b. 0b - Disabled 1b - Enabled
12 DBGRSTSLOWPAD	Debug Over Reset Via Slow Pads Enables or diasables trace via slow pads. If enabled, the trace pads have trace over functional reset feature enabled. This field does not take care of the clock configuration. 0b - Disabled 1b - Enabled
11 —	Reserved
10 CM72DBGREQ	Cortex-M7_2 Debug Request Drives the EDBGREQ input for Cortex-M7_2 and indicates if the debug request is generated. When the core goes into debug state, the field acknowledges that with a halted output signal (see MDMAPSTTS[CM72HLT]). If the core is in Stop mode, this field is used to wake up the core and transition it to the debug halt state. 0b - Debug request is not generated 1b - Debug request is generated
9 CM71DBGREQ	Cortex-M7_1 Debug Request Drives the EDBGREQ input for Cortex-M7_1 and indicates if the debug request is generated. When the core goes into debug state, the field acknowledges that with a halted output signal (see MDMAPSTTS[CM71HLT]). If the core is in Stop mode, this field is used to wake up the core and transition it to the debug halt state.

Table continues on the next page...

Internal address writes to this register are ignored.

84.15.9 DTS Semaphore (MDMAPDTSSEMAPHORE)

Offset

Register	Offset
MDMAPDTSSEMAPHORE	1Ch

Function

Used by software to assert triggers into the CoreSight cross-trigger matrix, which can be configured as to an external debug pin on the device. The intended use of this register is to notify tools that data is available. Individual bits identify the specific data. This register stores calibration variable triggers. When any of the trigger bits are set and the DTS_ENABLE is set, the module asserts an indicator to the EVTO pin. All 32 bits are implemented.

The dts_trigger out is NOT connected directly to the CTM network. You can achieve this functionality externally by looping back the output trigger onto the EVTI trigger input.

Diagram

84.16 SDA_AP register descriptions

The debugger and system have access to secure authentication control and status, implemented as registers in SDA_AP on the DAP bus. These registers provide authentication control, authentication status, key exchange information, and debug enable controls.

NOTE

The access to SDA_AP is possible even with the MC_ME.PRTN1_COFB0_CLKEN[REQ21] set as 1'b0.

84.16.1 SDA_AP memory map

Chapter 85
JTAG Controller (JTAGC)

85.1 Chip-specific JTAGC information

85.1.1 Chip-specific JTAGC information

The following figure shows the detailed TAP connectivity. SWD/JTAG SELECT, SWDP and JTAG-DP are part of ARM DAP

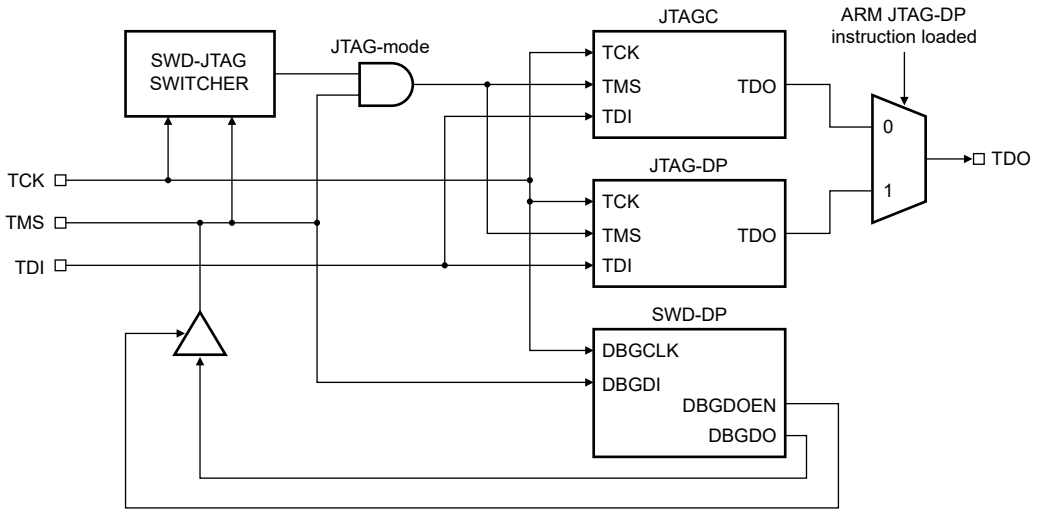

Figure 689. Test and Debug Access Port (TAP) connectivity

The debug port comes out of reset in a standard JTAG mode. It is switched to SWD mode by the change sequences described in JTAG to SWD change sequence . Once the mode has been changed, unused debug pins can be reassigned to any of their alternative muxed functions

JTAG-to-SWD change sequence:

1. Send more than 50 TCK cycles with TMS (SWDIO) =1
2. Send the 16-bit sequence on TMS (SWDIO) = 0111_1001_1110_0111 (MSB transmitted first)
3. Send more than 50 TCK cycles with TMS (SWDIO) =1

NOTE

In case of any reset event, JTAGC is moved to Test Logic Reset (TLR) state first and then JTAGC should be used.

NOTE

If JTAG pins are used for alternative functionality and reset event arrives then these pins need to be reconfigured to required functionality before using it, in order to avoid unintentional entry in JTAG mode.

85.2 Overview

JTAGC allows you to test chip functionality and connectivity while remaining transparent to system logic when not in test mode. Testing is performed via a boundary scan technique, as defined in the IEEE 1149.1-2001 standard. All data input to and output from JTAGC is communicated in serial format.

85.2.1 Block diagram

The following is a simplified block diagram of the JTAG Controller (JTAGC) block. See the chip-specific configuration information within this chapter as well as Register description for more information about the JTAGC registers.

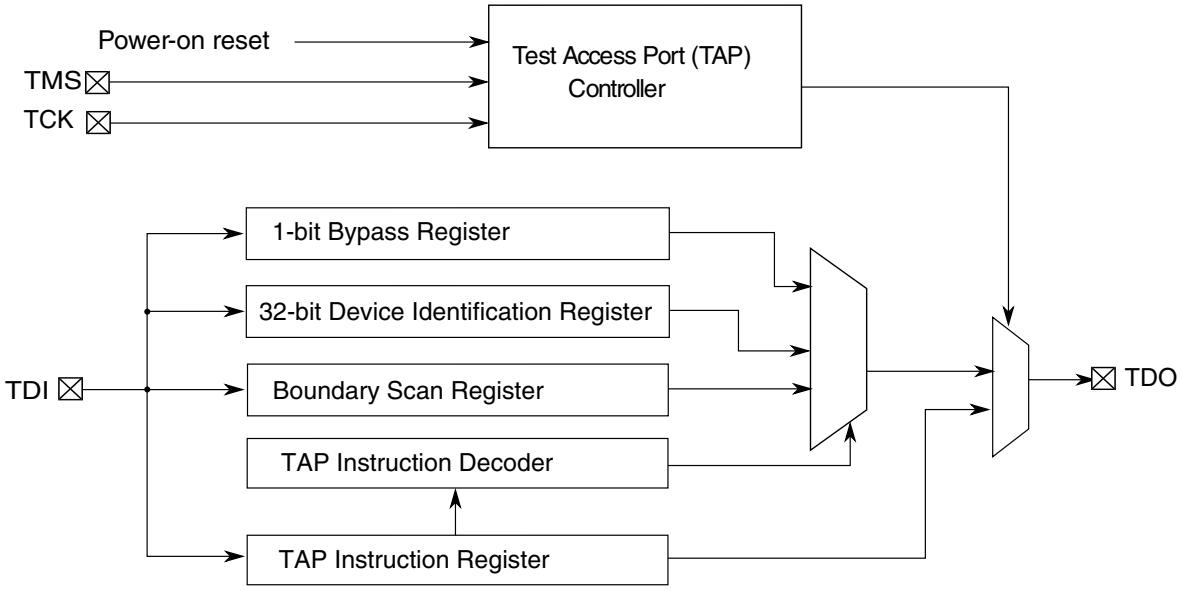

Figure 690. JTAG (IEEE 1149.1) block diagram

85.2.2 Features

The JTAGC block is compliant with the IEEE 1149.1-2001 standard, and supports the following features:

- IEEE 1149.1-2001 TAP interface
  - Four pins (TDI, TMS, TCK, and TDO)
- Instruction register that supports several IEEE 1149.1–2001 defined instructions as well as several public and private device-specific instructions (see JTAGC block instructions for a list of supported instructions).
- Sharing of the TAP with other TAP controllers via ACCESS_AUX_x instructions
- Bypass register, boundary scan register, and device identification register
- TAP controller state machine that controls the operation of the data registers, instruction register, and associated circuitry

85.3 Functional description

85.3.1 Modes of operation

The JTAGC block uses a power-on reset indication as its primary reset signals. Several IEEE 1149.1–2001 defined test modes are supported, as well as a bypass mode.

85.3.1.1 IEEE 1149.1–2001 defined test modes

The JTAGC block supports several IEEE 1149.1–2001 defined test modes. A test mode is selected by loading the appropriate instruction into the instruction register when the JTAGC is enabled. Supported test instructions include EXTEST, HIGHZ, CLAMP, PRELOAD.

Each instruction defines the set of data register(s) that may operate and interact with the on-chip system logic when the instruction is current. Only one test data register path is enabled to shift data between TDI and TDO for each instruction.

The boundary scan register is enabled for serial access between TDI and TDO when the EXTEST, PRELOAD instructions are active. The single-bit bypass register shift stage is enabled for serial access between TDI and TDO when the following instructions are active:

- BYPASS
- HIGHZ
- CLAMP

The functionality of each test mode is explained in more detail in JTAGC block instructions.

85.3.1.2 Bypass mode

When no test operation is required, the BYPASS instruction can be loaded to place the JTAGC block into bypass mode. When in bypass mode, the single-bit bypass shift register is used to provide a minimum-length serial path to shift data between TDI and TDO.

85.3.2 IEEE 1149.1-2001 (JTAG) TAP

The JTAGC block uses the IEEE 1149.1-2001 TAP for accessing registers. This port can be shared with other TAP controllers on the MCU. Ownership of the port is determined by the value of the currently loaded instruction. For more detail on TAP sharing via JTAGC instructions, see ACCESS_AUX_x instructions .

Data is shifted between TDI and TDO through the selected register starting with the least significant bit, as illustrated in the following figure. This applies for the instruction register, test data registers, and the bypass register.

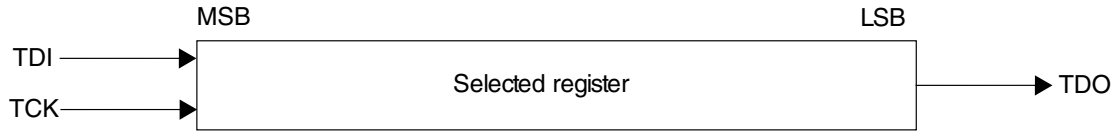

Figure 691. Shifting data through a register

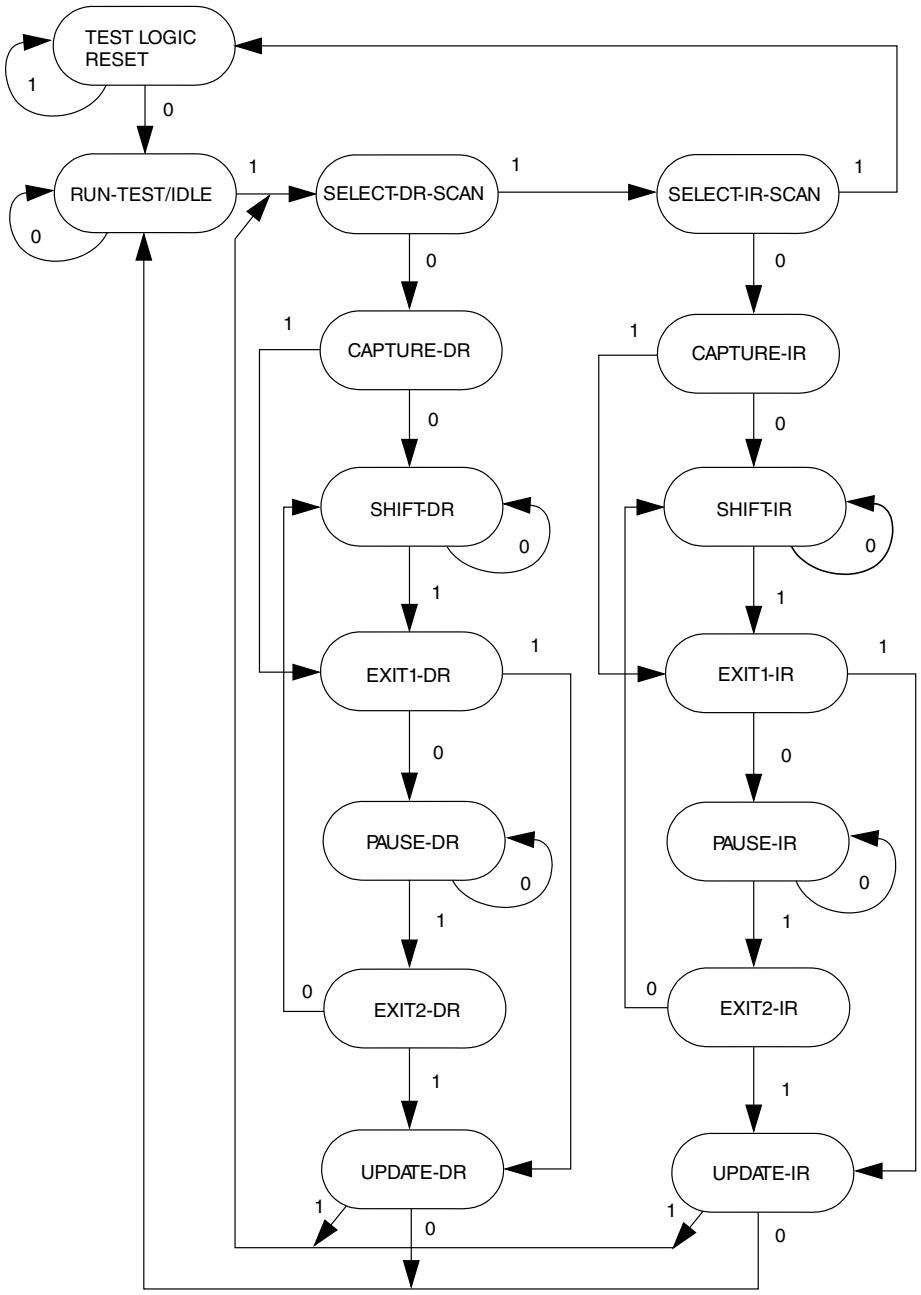
85.3.3 TAP controller state machine

The TAP controller is a synchronous state machine that interprets the sequence of logical values on the TMS pin.

The following figure shows the machine's states. The value shown next to each state is the value of the TMS signal sampled on the rising edge of the TCK signal. As the figure shows, holding TMS at logic 1 when clocking TCK through a sufficient number of rising edges also causes the state machine to enter the Test-Logic-Reset state.



The value shown adjacent to each state transition in this figure represents the value of TMS at the time of a rising edge of TCK.

Figure 692. IEEE 1149.1-2001 TAP controller finite state machine

85.3.3.1 Enabling the TAP controller

The JTAGC TAP controller is enabled by setting the JTAGC enable to a logic 1 value.

85.3.3.2 Selecting an IEEE 1149.1-2001 register

Access to the JTAGC data registers is achieved by loading the instruction register with any of the JTAGC block instructions when the JTAGC is enabled. Instructions are shifted in via the Select-IR-Scan path and loaded in the Update-IR state. At this point, all data register access is performed via the Select-DR-Scan path.

The Select-DR-Scan path is used to read or write the register data by shifting in the data (LSB first) during the Shift-DR state. When reading a register, the register value is loaded into the IEEE 1149.1-2001 shifter during the Capture-DR state. When writing a register, the value is loaded from the IEEE 1149.1-2001 shifter to the register during the Update-DR state. When reading a register, there is no requirement to shift out the entire register contents. Shifting may be terminated after the required number of bits have been acquired.

85.3.4 JTAGC block instructions

The JTAGC implements instructions defined in IEEE 1149.1-2001. See the chip-specific JTAGC information for the JTAGC instructions implemented on this chip. See the IEEE 1149.1-2001 standard for additional information. All undefined opcodes are reserved.

85.3.4.1 IDCODE instruction

IDCODE selects the 32-bit device identification register as the shift path between TDI and TDO. This instruction allows interrogation of the MCU to determine its version number and other part identification data. IDCODE is the instruction placed into the instruction register when the JTAGC block is reset.

85.3.4.2 PRELOAD instruction

The PRELOAD instruction has two functions:

- The PRELOAD portion of the instruction initializes the boundary scan register cells before selecting the EXTEST or CLAMP instructions to perform boundary scan tests. This is achieved by shifting in initialization data to the boundary scan register during the Shift-DR state. The initialization data is transferred to the parallel outputs of the boundary scan register cells on the falling edge of TCK in the Update-DR state. The data is applied to the external output pins by the EXTEST or CLAMP instruction. System operation is not affected.

85.3.4.3 EXTEST external test instruction

EXTEST selects the boundary scan register as the shift path between TDI and TDO. It allows testing of off-chip circuitry and board-level interconnections by driving preloaded data contained in the boundary scan register onto the system output pins. Typically, the preloaded data is loaded into the boundary scan register using the PRELOAD instruction before the selection of EXTEST. EXTEST asserts the internal system reset for the MCU to force a predictable internal state when performing external boundary scan operations.

85.3.4.4 TEST_LEAKAGE instruction

The TEST_LEAKAGE instruction forces the jtag_leakage output signal to high. It is intended to tristate all output pad buffers and disable all of the part's pad input buffers except JCOMP and TEST. The jtag_leakage signal is asserted at the falling edge of TCK following the TAP controller state machine transition from the Update-IR state to the Run-Test-Idle state. When asserted, the part disables TCK, TMS, and TDI inputs and forces them to a logic 1. The TAP controller state machine remains in the Run-Test-Idle state until the JCOMP input is set to a value other than the JTAGC enable encoding. TEST_LEAKAGE also asserts the internal system reset for the MCU to force a predictable internal state.

85.3.4.5 HIGHZ instruction

HIGHZ selects the bypass register as the shift path between TDI and TDO. When HIGHZ is active all output drivers are placed in an inactive drive state (for example, high impedance). HIGHZ also asserts the internal system reset for the MCU to force a predictable internal state.

85.3.4.6 CLAMP instruction

CLAMP allows the state of signals driven from MCU pins to be determined from the boundary scan register when the bypass register is selected as the serial path between TDI and TDO. CLAMP enhances test efficiency by reducing the overall shift path to a single bit (the bypass register) when conducting an EXTEST type of instruction through the boundary scan register. CLAMP also asserts the internal system reset for the MCU to force a predictable internal state.

85.3.4.7 ACCESS_AUX_x instructions

The JTAGC is configurable to allow other TAP controllers on the device to share the port with it. This is done by providing ACCESS_AUX_x instructions for each of these TAP controllers.

When this instruction is loaded, control of the JTAG pins is transferred to the selected TAP controller. Any data input via TDI and TMS is passed to the selected TAP controller, and any TDO output from the selected TAP controller is sent back to the JTAGC to be output on the pins.

The JTAGC regains control of the JTAG port during the UPDATE-DR state if the PAUSE-DR state was entered. Auxiliary TAP controllers are held in RUN-TEST/IDLE when they are inactive. Instructions not used to access an auxiliary TAP controller on a device are treated like the BYPASS instruction.

85.3.4.8 BYPASS instruction

BYPASS selects the bypass register, creating a single-bit shift register path between TDI and TDO. BYPASS enhances test efficiency by reducing the overall shift path when no test operation of the MCU is required. This allows more rapid movement of test data to and from other components on a board that are required to perform test functions. When the BYPASS instruction is active the system logic operates normally.

85.3.5 Boundary scan

The boundary scan technique allows signals at component boundaries to be controlled and observed through the shift-register stage associated with each pad. Each stage is part of a larger boundary scan register cell, and cells for each pad are interconnected serially to form a shift-register chain around the border of the design. The boundary scan register consists of this shift-register chain, and is connected between TDI and TDO when the EXTEST, PRELOAD instructions are loaded. The shift-register chain contains a serial input and serial output, as well as clock and control signals.

85.3.6 Clocking

There is one clock for this module. For more information See External signals.

85.3.7 Interrupts

This module has no interrupts.

85.3.8 Reset

The JTAGC block is placed in reset when:

- Power-on reset is asserted
- TMS input is held high for enough consecutive rising edges of TCK to sequence the TAP controller state machine into the Test-Logic-Reset state

Holding TMS high for five consecutive rising edges of TCK guarantees entry into the Test-Logic-Reset state regardless of the current TAP controller state. Asserting power-on reset results in asynchronous entry into the reset state.

When in reset, the following actions occur:

- The TAP controller is forced into the Test-Logic-Reset state, thereby disabling the test logic and allowing normal operation of the on-chip system logic to continue unhindered.
- The instruction register is loaded with the IDCODE instruction.

85.3.8.1 JTAGC reset configuration

When in reset, the TAP controller is forced into the Test-Logic-Reset state, thus disabling the test logic and allowing normal operation of the on-chip system logic. In addition, the instruction register is loaded with the IDCODE instruction.

85.4 External signals

JTAGC includes a set of signals that connect to off-chip development tools and allow access to test support functions. The JTAGC signals are outlined in the following table and described in the following sections.

Table 771. JTAG signal properties

Name	I/O	Function	Reset state
TCK	Input	Test clock	Weak pulldown
TDI	Input	Test data in	Weak pullup
TDO	Output	Test data out	High Z[1]
TMS	Input	Test mode select	Weak pullup

1. TDO output buffer enable is negated when the JTAGC is not in the Shift-IR or Shift-DR states. A weak pull may be implemented at the TDO pad for use when JTAGC is inactive.

85.4.1 Test clock input (TCK)

Test Clock Input (TCK) is an input pin used to synchronize the test logic and control register access through the TAP.

85.4.2 Test data input (TDI)

Test Data Input (TDI) is an input pin that receives serial test instructions and data. TDI is sampled on the rising edge of TCK.

85.4.3 Test data output (TDO)

Test Data Output (TDO) is an output pin that transmits serial output for test instructions and data. TDO is tristateable and is actively driven only in the Shift-IR and Shift-DR states of the TAP controller state machine, which is described in TAP controller state machine.

85.4.4 Test mode select (TMS)

Test Mode Select (TMS) is an input pin used to sequence the IEEE 1149.1-2001 test control state machine. TMS is sampled on the rising edge of TCK.

85.5 Initialization

To initialize the JTAGC block and enable access to registers, the following sequence is required:

1. Place the JTAGC in reset through TAP controller state machine transitions controlled by TMS.
2. Load the appropriate instruction for the test or action to be performed.

85.6 Application information

The test logic is a static logic design, and TCK can be stopped in either a high or low state without loss of data. However, the system clock is not synchronized to TCK internally. Any mixed operation using both the test logic and the system functional logic requires external synchronization.

85.7 Register description

This section provides a detailed description of the JTAGC block registers accessible through the TAP interface, including data registers and the instruction register. Individual bit-level descriptions and reset states of each register are included. These registers are not memory-mapped and can only be accessed through the TAP.

85.7.1 Instruction register

The JTAGC block uses a 8-bit instruction register as shown in the following figure.

The instruction register allows instructions to be loaded into the block to select the test to be performed, or the test data register to be accessed, or both. Instructions are shifted in through TDI when the TAP controller is in the Shift-IR state, and latched on the falling edge of TCK in the Update-IR state. The latched instruction value can only be changed in the Update-IR and Test-Logic-Reset TAP controller states.

Synchronous entry into the Test-Logic-Reset state results in the IDCODE instruction being loaded on the falling edge of TCK. Asynchronous entry into the Test-Logic-Reset state results in asynchronous loading of the IDCODE instruction. During the Capture-IR TAP controller state, the instruction shift register is loaded with the value 0b1, making this value the register's read value when the TAP controller is sequenced into the Shift-IR state.

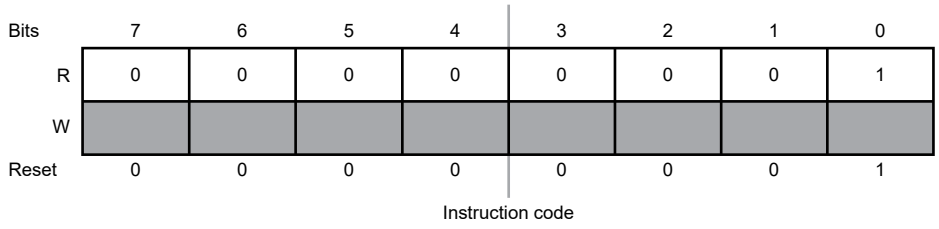


Figure 693. Instruction register

85.7.2 Bypass register

The bypass register is a single-bit shift register path selected for serial data transfer between TDI and TDO when the following instructions are active:

- BYPASS
- HIGHZ
- CLAMP

After entry into the Capture-DR state, the single-bit shift register is set to a logic 0. Therefore, the first bit shifted out after selecting the bypass register is always a logic 0.

85.7.3 Device identification register

The device identification (JTAG ID) register, shown in the following figure, allows the revision number, part number, manufacturer, and design center responsible for the design of the part to be determined through the TAP.

The device identification register is selected for serial data transfer between TDI and TDO when the IDCODE instruction is active. Entry into the Capture-DR state when the device identification register is selected loads the IDCODE into the shift register to be shifted out on TDO in the Shift-DR state. No action occurs in the Update-DR state.

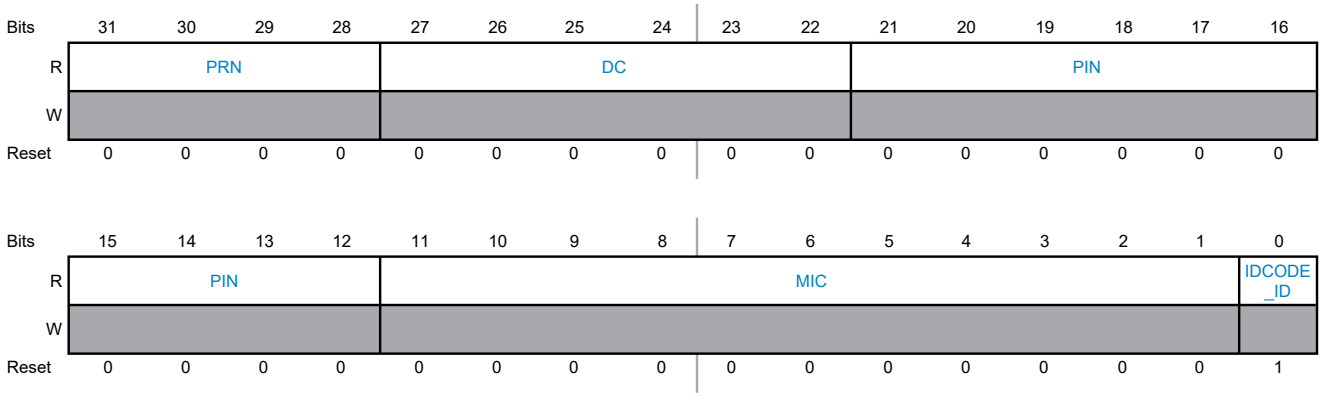

Figure 694. Device identification register

The following table describes the device identification register functions. The device identification register values are described in the chip-specific JTAGC information.

Table 772. Device identification register field descriptions

Field	Function
PRN	Part revision number Contains the revision number of the part.
DC	Design center Indicates the design center.
PIN	Part identification number Contains the part number of the device.
MIC	Manufacturer identity code Contains the reduced Joint Electron Device Engineering Council (JEDEC) ID .
IDCODE ID	IDCODE register ID Identifies this register as the device identification register and not the bypass register. Always set to 1.

85.7.4 Boundary scan register

The boundary scan register is connected between TDI and TDO when the EXTEST, PRELOAD instructions are active. It is used to:

- Capture input pin data
- Force fixed values on output pins
- Select a logic value and direction for bidirectional pins

Each bit of the boundary scan register represents a separate boundary scan register cell, as described in the IEEE 1149.1-2001 standard and discussed in Boundary scan. The size of the boundary scan register and bit ordering is device-dependent and can be found in the device BSDL file.

Chapter 86
JTAG Data Communication (JDC)

86.1 Overview

JDC module provides the capability to move register data between the IPS and JTAG domains. This facilitates communication between internal resources that access memory-mapped register space and an external tool that accesses the JTAG port.

The JDC module consists of:

- IPS-accessible registers
- JTAG-accessible registers
- Associated logic to coordinate movement of data from one register domain to another

The JDC implements the following IPS data registers, occupying separate memory space:

- 1 32-bit memory mapped register that can be read or written via IPS (JTAG Output Data Register (JOUT_IPS)), and whose contents are ported out for capture into a JTAG register (JOUT) to be read via the JTAG port.
- 1 32-bit memory mapped register that can only be read via IPS (JTAG Input Data Register (JIN_IPS)), and whose contents are loaded from a JTAG register (JIN).

JDC indicates when:

- New data has been shifted in via the JTAG port and is ready to be read from the JTAG Input Data Register (JIN_IPS) register
- New data has been written to the JTAG Output Data Register (JOUT_IPS) register and is ready to be read via the JTAG port

A Module Status Register (MSR) captures the state of these flags and also provides the flags to a JTAG register (JOUT) for tool visibility.

86.1.1 Block diagram

There is a single bus interface to port register data out to the JTAGC, and a single bus interface to port data in from the JTAGC. The following figure is the JDC module block diagram.

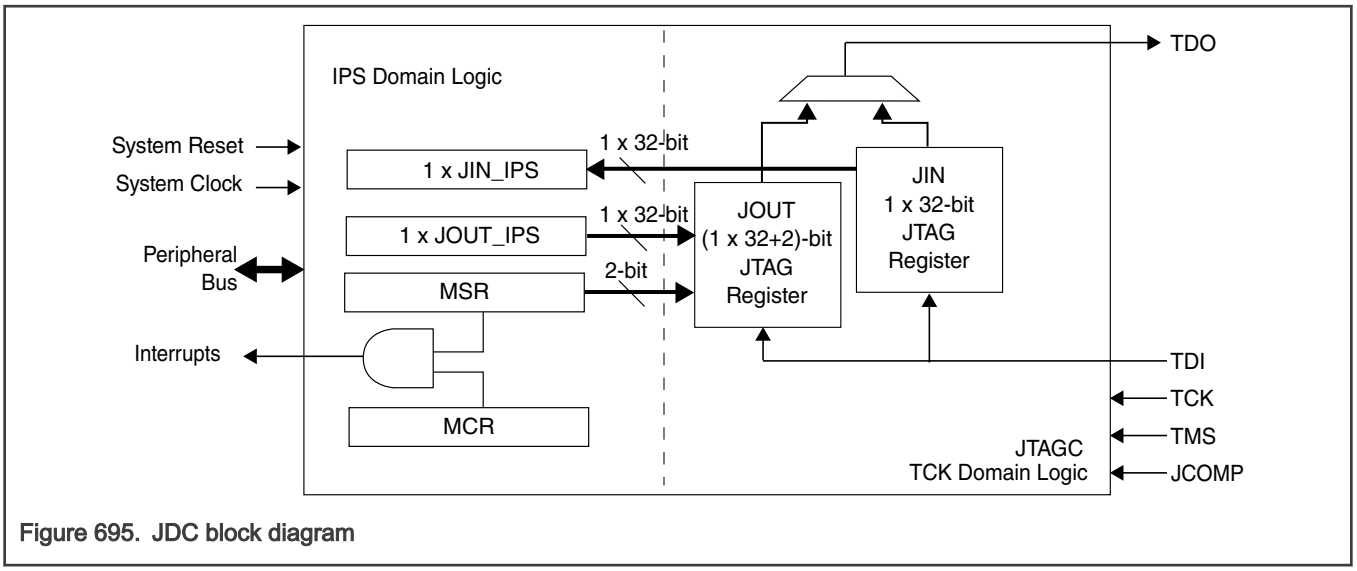

Figure 695. JDC block diagram

86.2 Functional description

The JDC module provides the ability to shift in data via the JTAG port and capture that data in memory-mapped register that can be accessed via IPS. It also provides the ability to capture data written to memory-mapped register into a JTAG shift register for output via the JTAG port.

86.2.1 JDC functionality

An overview of the module functionality is described here:

- Software write to the JOUT_IPS register:
  1. The JDC sets the JOUT_RDY flag bit, indicating new data is available to be read from the JOUT register via the JTAG port.
  2. The MSR reflects the state of the JOUT_RDY bit.
  3. The JDC also captures the state of the JOUT_RDY bit in the JOUT register.
  4. A JTAG read of the JOUT register via execution of the JOUT_READ instruction with a JOUT_RDY bit whose value is logic 1 indicates that the register contains new data.
  5. The JDC clears the JOUT_RDY flag bit upon exit of the Capture-DR JTAG state during execution of the JOUT_READ instruction.
  6. Clearing the JOUT_RDY bit indicates to software that a new data value can be written to the JOUT_IPS register.
- JTAG write to the JIN register via execution of the JIN_WRITE JTAG instruction:
  1. The JDC updates the contents of the JIN_IPS register upon exit of the Update-DR state.
  2. An update of the JIN_IPS register sets the JIN_RDY flag bit, indicating new data is available to be read via IPS.
  3. The MSR register reflects the state of the JIN_RDY bit.
  4. The JDC also captures the state of the JIN_RDY bit in the JOUT register.
  5. The JDC clears the JIN_RDY flag bit upon software read of the JIN_IPS register.
  6. A JTAG read of the JOUT register with a JIN_RDY value of logic 0 indicates that new data can be written to the JIN register.

86.2.2 JTAG register access

See the JTAGC documentation for information on how to access the JTAG registers.

86.2.2.1 JDC block instructions

The JDC block implements the instructions listed in Table 773. This section gives an overview of each instruction. All undefined opcodes are reserved.

Table 773. JTAG instructions

Instruction	Code[4:0]	Instruction summary
Reserved	00001	Factory debug reserved.
JOUT_READ	00010	Selects JOUT data register. The JDC captures data from JOUT_IPS into JOUT data register upon entry to Capture-DR state when JOUT_READ is active.
JIN_WRITE	01110	Selects JIN data register. The JDC captures data from JIN into JIN_IPS upon exit of Update-DR state when JIN_WRITE is active.

Table continues on the next page...

Table 773. JTAG instructions (continued)

Instruction	Code[4:0]	Instruction summary
BYPASS[1]	11111	Selects bypass register for data operations.
Reserved	All other opcodes	Decoded to select bypass register.

1. This is an IEEE 1149.1-2001 defined instruction. See the IEEE 1149.1-2001 standard for more details.

86.2.3 Clocking

JDC module uses TCK and inverted TCK as clock source.

86.2.4 Interrupts

This module has no interrupts.

86.3 External signals

JDC signals are listed in the following table.

Table 774. Signal properties

Name	Function	I/O	Reset
TCK	Test clock input	I	—
TMS	Test mode select	I	0
TDI	Test data in	I	0
JCOMP	JTAG compliance pin	I	0
TDO	Test data out	O	HiZ

86.4 Initialization

This module does not require initialization.

86.5 Secure challenge/response connection procedure

A summary of how the JDC can be used to interact with a security module to perform challenge/response password authorization is as follows:

1. After exit of reset, all registers are at their reset values. JIN_RDY bit value of 0 indicates that the tool may write data to the JIN register. JOUT_RDY bit value of 0 indicates that software may write data to the JOUT_IPS register.
2. The MCR register is programmed to enable JOUT and JIN interrupts, or not.
3. Once the tool is ready to start the authorization process, it writes a value to the JIN register via execution of the JTAGC JIN_WRITE instruction.
4. Software monitors the state of the JIN_RDY bit or enables the JIN interrupt and uses the interrupt assertion as a trigger to start the authorization process.
5. Once the authorization process is started, software writes the first JOUT value to the JOUT_IPS register. This sets the JOUT_RDY bit value to 1.

6. Following the initial tool write to the JIN register, the tool polls the JOUT register to determine when software has provided a challenge word. Upon reading the JOUT register with JOUT_RDY bit set, the tool records the data value to be used to generate the appropriate response. The read of the JOUT register clears the JOUT_RDY bit. The clearing of the JOUT_RDY bit also sets the JOUT_INT bit and asserts the JOUT interrupt if the MCR[JOUT_IEN] is set.
7. With the JOUT_RDY bit cleared, software may now provide the next challenge word.
8. Once the tool has generated a response word, it uses the value of the JIN_RDY bit from the JOUT register read to determine when it can perform a write to the JIN register to provide the response.
9. The security module can provide additional challenge words and read back the corresponding response words as needed, repeating the process.

Simply providing a password without using the challenge/response protocol can be done in a similar way. The tool provides 32-bits of the password at a time with each write to the JIN register, and monitors the JIN_RDY bit value of the JOUT register to determine when the next JIN register value can be written. There is no need for software to write the JOUT_IPS register in this case.

For details related to the lifecycle stage at which this process is performed, see the "Hardware Security Engine" chapter.

86.6 JDC register descriptions

The following sections describe the implemented 32-bit registers. Only 32-bit accesses are valid. The effects of access that are not 32 bits are not defined.

86.6.1 JDC memory map

JDC base address: 4039_4000h

Offset	Register	Width (In bits)	Access	Reset value
0h	Module Configuration Register (MCR)	32	RW	0000_0000h
4h	Module Status Register (MSR)	32	RW	0000_0000h
8h	JTAG Output Data Register (JOUT_IPS)	32	RW	0000_0000h
Ch	JTAG Input Data Register (JIN_IPS)	32	R	0000_0000h

86.6.2 Module Configuration Register (MCR)

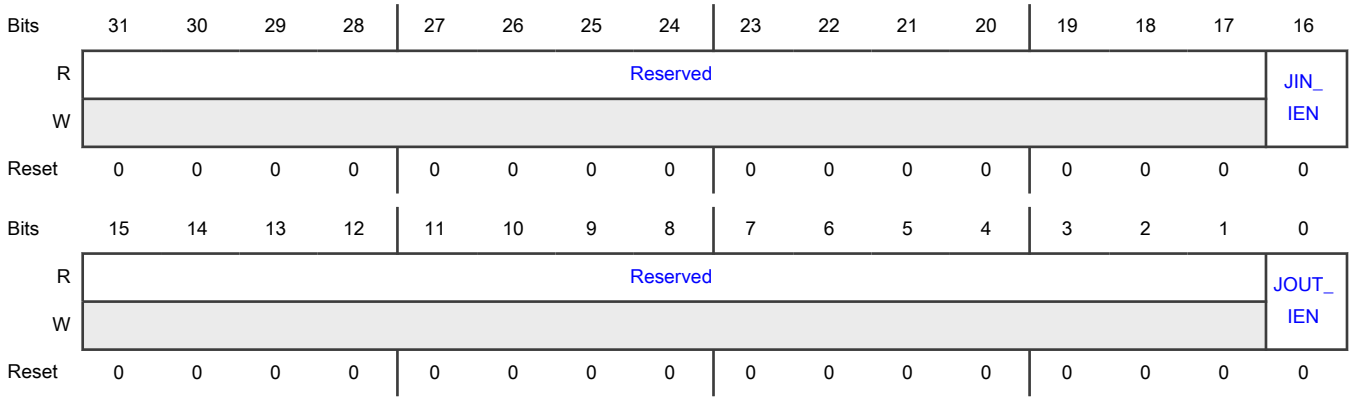
Offset

Register	Offset
MCR	0h

Function

The MCR enables the interrupt outputs of the JDC. This register is reset by system destructive reset.

Diagram



Fields

Field	Function
31-17 —	Reserved
16 JIN_IEN	JIN Interrupt Enable 0b - Setting MSR[JIN_INT] bit does not assert the JIN interrupt 1b - Setting MSR[JIN_INT] bit asserts the JIN interrupt
15-1 —	Reserved
0 JOUT_IEN	JOUT Interrupt Enable 0b - Setting MSR[JOUT_INT] bit does not assert the JOUT interrupt 1b - Setting MSR[JOUT_INT] bit asserts the JOUT interrupt

86.6.3 Module Status Register (MSR)

Offset

Register	Offset
MSR	4h

Function

The MSR holds the JTAG register status and interrupt bits. This register is reset by system destructive reset.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved													JIN_RDY	Reserved	JIN_INT

Fields

Field	Function
31-19 —	Reserved
18 JIN_RDY	JIN Ready (read only) 0b - Cleared upon software read of JIN_IPS contents via IPS 1b - Set when new data is written to the JIN_IPS register
17 —	Reserved
16 JIN_INT	JIN Interrupt 0b - Cleared by writing logic 1 1b - Set when new data is written to the JIN_IPS register
15-3 —	Reserved
2 JOUT_RDY	JOUT Ready (read only) 0b - Cleared upon tool read of JOUT register via JTAG port 1b - Set when new data is written to the JOUT_IPS register
1 —	Reserved
0 JOUT_INT	JOUT Interrupt 0b - Cleared by writing logic 1 1b - Set when JOUT_RDY bit is cleared by tool reading JOUT register

86.6.4 JTAG Output Data Register (JOUT_IPS)

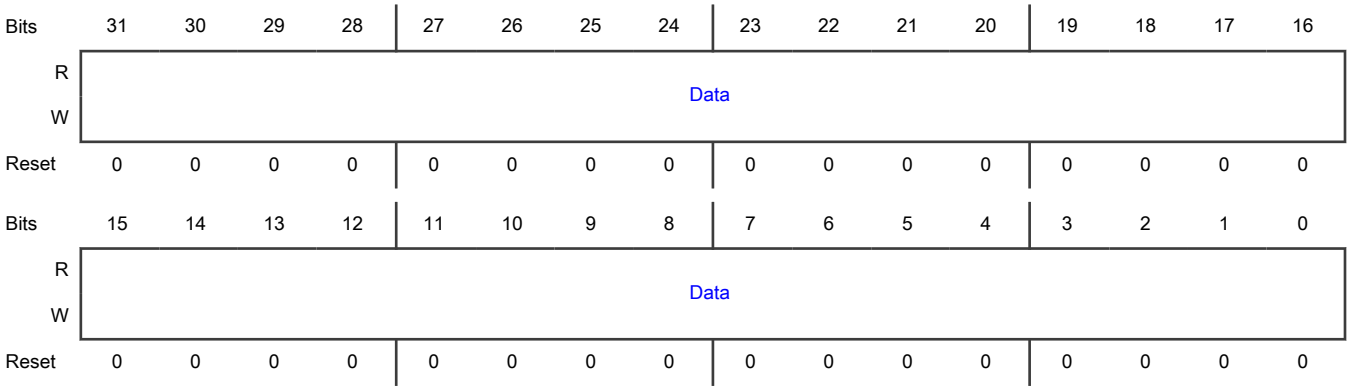
Offset

Register	Offset
JOUT_IPS	8h

Function

The JOUT_IPS register holds data written via IPS. The JDC captures the JOUT_IPS contents into the JOUT register to be read via the JTAG port. This register is reset by system destructive reset.

Diagram



Fields

Field	Function
31-0 Data	JOUT_IPS Data

86.6.5 JTAG Input Data Register (JIN_IPS)

Offset

Register	Offset
JIN_IPS	Ch

Function

The JIN_IPS register holds data written to the JTAG input data register (JIN) via the JTAG port, where the data can be read via IPS. Any IPS write to the JIN_IPS register returns a transfer error. This register is reset by system destructive reset.

Diagram

86.7 Non-memory-mapped register definition

The JDC also implements two JTAG accessible registers that are not memory-mapped. One JTAG register shifts in data to be placed in the JIN_IPS register. The other JTAG register captures data from the JOUT_IPS register plus ready status from the MSR, to be shifted out via the JTAG port.

86.7.1 JTAG output data register (JOUT)

The JOUT register captures data from the JOUT_IPS register upon execution of the JOUT_READ JTAG instruction. It also holds the JIN_RDY and JOUT_RDY status bits. This register is reset by system destructive reset and JTAG reset. The reset value of the JOUT register is 0. The following figure shows the format of the JOUT register.

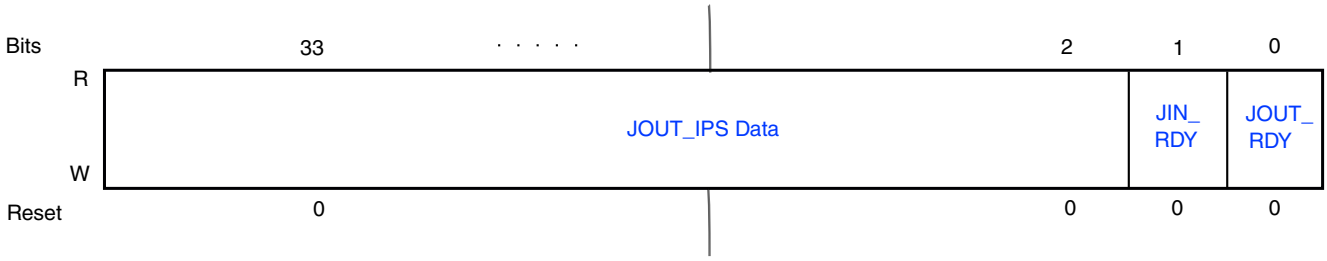

Figure 696. JOUT

The JOUT register is described in the following table.

Table 775. JOUT JTAG register field descriptions

Field	Function
JOUT_IPS Data	JOUT_IPS Data Data value from JOUT_IPS register

Table continues on the next page...

Table 775. JOUT JTAG register field descriptions (continued)

Field	Function
JIN_RDY	JIN_RDY State of JIN_RDY bit from MSR
JOUT_RDY	JOUT_RDY State of JOUT_RDY bit from MSR

86.7.2 JTAG input data register (JIN)

The external tool writes data to the JIN register via JTAG during execution of the JIN_WRITE JTAG instruction. The JDC later captures JIN data in the JIN_IPS register to be read via IPS. This register is reset by system destructive reset and JTAG reset. The reset value of the JIN register is 0. The following figure shows the format of the JIN register.

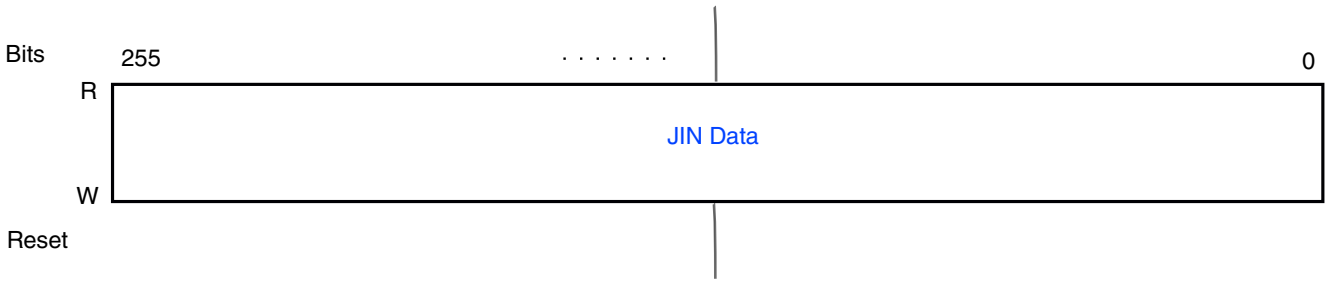

Figure 697. JIN

The JIN register is described in the following table.

Table 776. JIN JTAG register field descriptions

Field	Description
JIN Data	Contains data to be captured in JIN_IPS register upon exit of Update-DR state when executing WRITE_JIN JTAG instruction.

86.8 Glossary

IPS	Internal peripheral system
XBAR	Crossbar bus interface

Chapter 87
Temperature Sensor (TempSense)

87.1 Chip-specific TempSense information

87.1.1 TempSense configuration

TEMPSENSE module depends on the V25 FLA voltage.

TEMPSENSE module temperature is not dependent on different supply voltages 2.97 V, 3.3 V, and 5 V (VDD_HV_A = VDD_HV_B = VREFH).

87.2 Overview

TEMPSENSE is used to measure the temperature on the chip through an ADC.

The TEMPSENSE module contains control registers for use with the Engineering temperature sensor (ETS) hard block. These registers use a peripheral bus interface to communicate with the chip.

87.2.1 Block diagram

The functional structure of the TEMPSENSE can be seen in the block diagram in Figure 698.

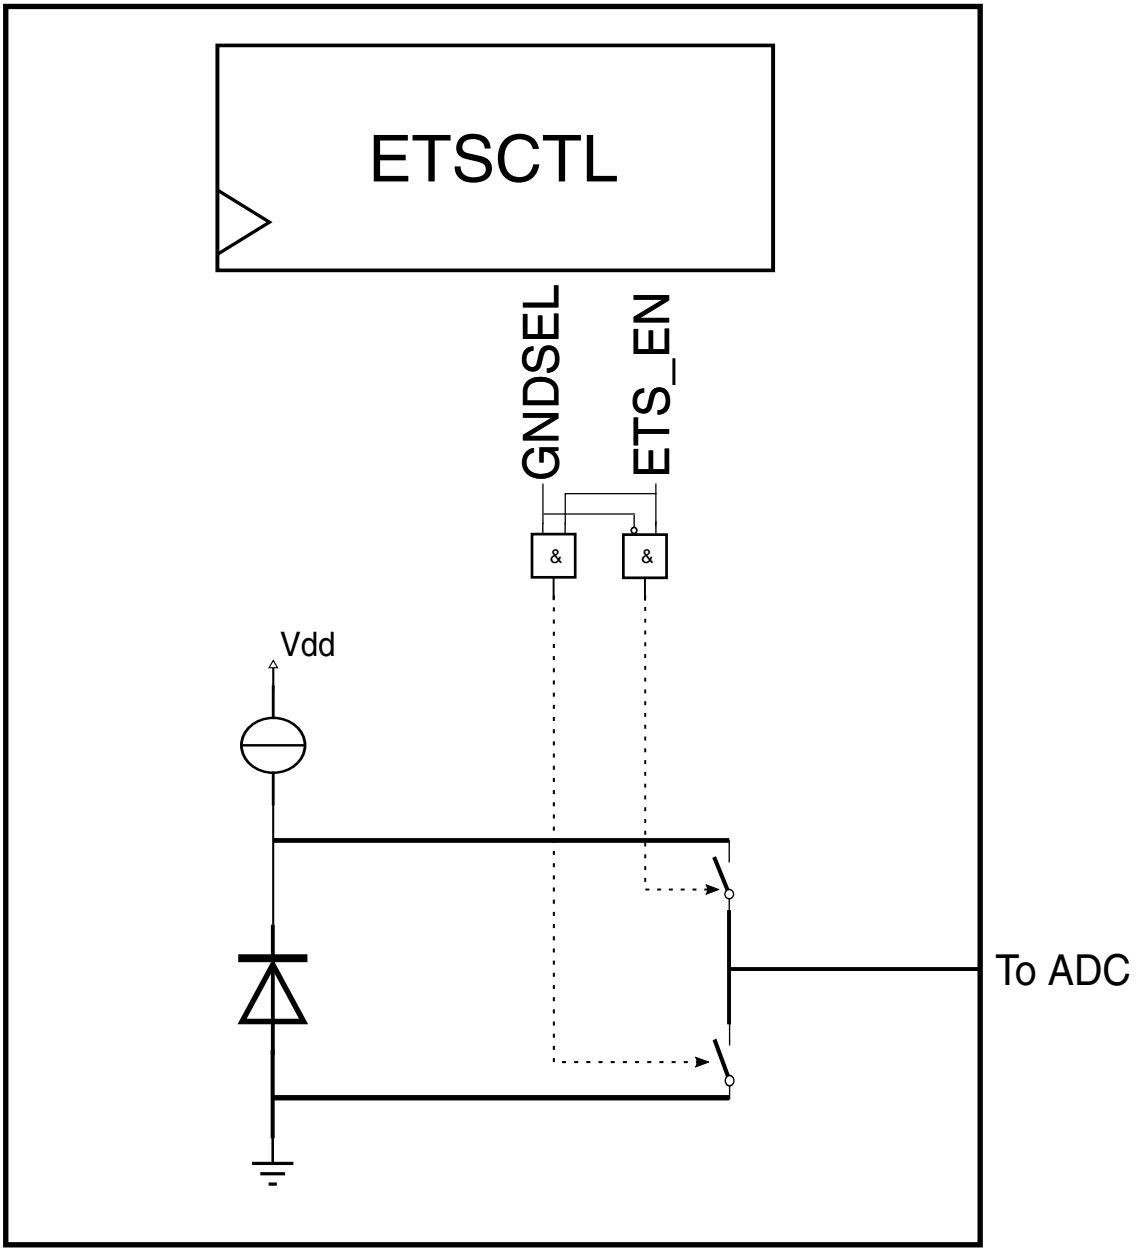

Figure 698. TEMPSENSE block diagram

87.2.2 Features

The TEMPSENSE includes the following features:

- Provide a voltage proportional to the temperature which will be read out by ADC
- Ground selection for improved precision in the ETS. The ETS ground could be different from the ADC ground. By exposing it to the ADC, the temperature calculation could be improved as the voltage value will be more precise.

87.3 Functional description

87.3.1 Clocking

This module has no clocking considerations.

87.3.2 Interrupts

This module has no interrupts.

87.3.3 General

The TEMPSENSE module is designed to measure the temperature on the chip. The TEMPSENSE output can be read by an ADC on demand so that the software can determine the current die temperature. The software should enable the TEMPSENSE by setting ETSCTL[ETS_EN].

Coefficients are used to allow a simple and accurate calculation of linearized temperature directly from the ADC. The increase of the sampling time of the ADC from the minimum sampling value is increasing the temperature accuracy.

87.3.4 Initialization

87.3.4.1 Conversion from voltage to temperature

Solve the equation for the conversion from voltage to temperature, where V_{ETS} is the difference of V_{be} and V_{GND}. V_{GND} is expose on the ADC output when ETSCTL[GNDSEL] is set.

$$T_{ETS} = TCA_0 + TCA_1 \cdot V_{ETS} + TCA_2 \cdot V_{ETS}^2$$

The coefficients TCA0, TCA1 and TCA2 are read from the corresponding registers. They are stored in a signed fixed-point format as the following TCAx(11,4) (1 bit for the sign, 11 bits for the integer part and 4 bits for the decimal part).

The calculation of the temperature should be done with the actual coefficient values provided in the TCAx fields. See the example below for an ambient temperature of 25C, and an ADC reference voltage (V_{REFH}) of 5V. See the ADC section of the device data sheet for more details on V_{REFH} and N-bit level resolution.

$$TCA0 = (000110100100.1110)_2 = (000110100100)_2 + (1110)_2 \times \frac{1}{2^4} = +((420)_{10} + (14)_{10} \times \frac{1}{2^4}) = +420.8750\ C$$

$$TCA1 = (100010101111.1110)_2 = (100010101111)_2 + (1110)_2 \times \frac{1}{2^4} = -((175)_{10} + (14)_{10} \times \frac{1}{2^4}) = -175.8750\ C/V$$

$$TCA2 = (100000011101.1110)_2 = (100000011101)_2 + (1110)_2 \times \frac{1}{2^4} = -((29)_{10} + (14)_{10} \times \frac{1}{2^4}) = -29.8750\ C^2/V^2$$

$$V_{ETS} = (010110001011)_2 = (1419)_{10} \times \frac{V_{REFH}}{2^N}$$

By using the formula, the junction temperature calculated is 26.5838 C.

The maximal calculation error is 0.0313 C.

87.4 External signals

There are no external signals for this module.

87.5 Memory map and register definition

87.5.1 Transfer error description

The following actions will cause a transfer error and will not change the register content:

- Any access to an unused register address
- Write access to a read-only register (TCAx)

87.5.2 TempSense register descriptions

87.5.2.1 TempSense memory map

TEMPSENSE base address: 4037_C000h

Offset	Register	Width (In bits)	Access	Reset value

Appendix A
General Changes

A.1 General changes

• Editorial changes — Each new release of this document includes editorial improvements such as: ◦ Spelling ◦ Grammar ◦ Punctuation ◦ Voice ◦ Tense ◦ Capitalization ◦ Formatting ◦ Presentation ◦ Navigation
• MC_ME changes: updated the bit description of PRTN2_COFB1_CLKEN[REQ62], PRTN2_COFB1_CLKEN[REQ63], PRTN2_COFB2_CLKEN[REQ64], PRTN2_COFB1_STAT[BLOCK62], PRTN2_COFB1_STAT[BLOCK63], and PRTN2_COFB2_STAT[BLOCK64].
• Input Glitch Filter(IGF) changes: updated the bit width of RTHRn[RTH] and FTHRn[FTH] to 24.
• System Integration Unit Lite2 (SIUL2) changes: removed "S32K358 - 0x166" from MIDR1[PART_NO].
• LVDS Fast Asynchronous Serial Transmission (LFAST) changes: Updated GPR0 register and removed GPR1 register.

Appendix B
Release Notes

B.1 About This Manual changes

- Updated the reserved section of the Special terms topic.

B.2 Introduction changes

No substantial content changes.

B.3 Memory map changes

No substantial content changes.

B.4 Signal Multiplexing changes

No substantial content changes.

B.5 Cortex-M7 Overview changes

No substantial content changes.

B.6 Overlay Management Unit (OMU)

B.6.1 Chip-specific OMU information changes

- Added OMU configuration.

B.6.2 OMU module changes

- Updated Features section.

B.7 Miscellaneous Control Module (MCM)

B.7.1 Chip-specific MCM information changes

No substantial content changes.

B.7.2 MCM module changes

No substantial content changes.

B.8 Miscellaneous System Control Module (MSCM)

B.8.1 Chip-specific MSCM information changes

No substantial content changes.

B.8.2 MSCM module changes

No substantial content changes.

B.9 Virtualization Wrapper (VIRT_WRAPPER)

B.9.1 Chip-specific VIRT WRAPPER information changes

No substantial content changes.

B.9.2 Virt_Wrapper changes

No substantial content changes.

B.10 System Integration Unit Lite2 (SIUL2)

B.10.1 Chip-specific SIUL2 information changes

No substantial content changes.

B.10.2 SIUL2 module changes

- In Block diagram, mentioned that REQ pins mean interrupt request pins.
- In External interrupts, mentioned that IRC means Internal RC Oscillator.

- Updated the Block diagram.

B.11 Crossbar Switch Lite (AXBS_Lite)

B.11.1 Chip-specific AXBS information changes

No substantial content changes.

B.11.2 AXBS module changes

No substantial content changes.

B.12 Peripheral Bridge (AIPS_Lite)

B.12.1 Chip-specific AIPS_Lite information changes

No substantial content changes.

B.12.2 AIPS_Lite module changes

No substantial content changes.

B.13 Direct Memory Access Multiplexer (DMAMUX)

B.13.1 Chip-specific DMAMUX information changes

No substantial content changes.

B.13.2 DMAMUX module changes

• Updated Block diagram. • Updated the image "DMAMUX triggered channels" (Figure 25). • Added a short introduction in Modes of operation.

B.14 Enhanced Direct Memory Access (eDMA3)

B.14.1 Chip-specific eDMA3 information changes

• Updated DMA channels to add the DMA instances.

B.14.2 eDMA3 module changes

No substantial content changes.

B.15 INTM module changes

• Moved the memory map chapter to the end of the chapter.
• Editorial change in Overview. • Editorial change in INTM register descriptions. • Editorial change in long_description of MM. • Editorial change in Interrupt Acknowledge (INTM_IACK). • Editorial change in Interrupt Latency for Monitor a (INTM_LATENCY0 - INTM_LATENCY3). • Editorial change in Functional description.
• Changed bit field access type from RW to WO for Interrupt Acknowledge (INTM_IACK) register.
• Added Glossary.
• Added Register links all over the document. • Updated Figure 36. • Updated Registers, Initialization, Functional description topics.

Table continues on the next page...

• Topic Glossary removed.
• Updated Figure 36.
• Updated Functional description with a note to mention only level type interrupts are supported.
• Added description of the term FCCU in bullet no.5 of the topic Initialization.
• Updated Figure 36, added INTM_IRQSEL.
• Updated note in Functional description section.
• Removed ITRC occurence from Functional description. • For INTM_TIMER0-INTM_TIMER3 registers, updated access of TIMER bit field to read only

B.16 Semaphores2 (SEMA42)

B.16.1 Chip-specific SEMA42 information changes

No substantial content changes.

B.16.2 SEMA42 module changes

• Updated Clocking section.

B.17 Crossbar Integrity Checker (XBIC)

B.17.1 Chip-specific XBIC information changes

No substantial content changes.

B.17.2 XBIC module changes

No substantial content changes.

B.18 Extended Resource Domain Controller (XRDC)

B.18.1 Chip-specific XRDC information changes

No substantial content changes.

B.18.2 XRDC module changes

No substantial content changes.

B.19 Memories and Memory Interfaces changes

No substantial content changes.

B.20 Embedded Flash Memory (c40asf)

B.20.1 Chip-specific C40asf information changes

- Updated Flash memory configuration and register settings.

B.20.2 Embedded Flash Memory (c40asf)

No substantial content changes.

B.21 Flash Memory Controller (PFLASH)

B.21.1 Chip-specific PFLASH information changes

No substantial content changes.

B.21.2 PFLASH controller module changes

No substantial content changes.

B.22 RAM Controller (PRAMC)

B.22.1 Chip-specific PRAMC information changes

No substantial content changes.

B.22.2 PRAMC module changes

- Block diagram - Removed internal content from the section.

B.23 Clocking module changes

- Updated Other clocks and S32K396 Clock system diagram.
- In Gasket configurations in various clocking modes, changed "mode A" to "mode A+", added footnotes, and added a note at the end.

- Updated "PLAT_AIPS_CLK" to "AIPS_PLAT_CLK" throughout.
- Added Mapping of IPs and different clock modes.

B.24 Clock Generation Module (MC_CGM)

B.24.1 Chip-specific MC_CGM information changes

No substantial content changes.

B.24.2 MC_CGM module changes

No substantial content changes.

B.25 FIRC module changes

No substantial content changes.

B.26 SIRC module changes

No substantial content changes.

B.27 FXOSC module changes

No substantial content changes.

B.28 PLL Digital Interface (PLLDIG)

B.28.1 Chip-specific PLLDIG information changes

No substantial content changes.

B.28.2 PLLDIG module changes

No substantial content changes.

B.29 Reset module changes

- Updated the RESET chapter throughout.

B.30 Reset Generation Module (MC_RGM)

B.30.1 Chip-specific MC_RGM information changes

No substantial content changes.

B.30.2 MC_RGM module changes

No substantial content changes.

B.31 POR_WDG module changes

- Updated Features, Introduction, Windows of operation, and Introduction.

B.32 Boot Overview changes

No substantial content changes.

B.33 Security overview changes

- Updated Security features.

B.34 HSE_B module changes

- Added register "CONFIG_REG_GPR".

B.35 DCF module changes

No substantial content changes.

B.36 DCM_GPR module changes

- Changed EMAC/EMAC2 to MAC/MAC2 throughout the chapter.
- Revised long description for DCMRWF1[PMIC_PGOOD_HNDSHK_BYP] and DCMRWF2[PGOOD_POLARITY].
- Revised long description for DCMRWF1[PMIC_PGOOD_HNDSHK_BYP] and DCMRWF2[PGOOD_POLARITY].
- Revised "DCM_GPR register descriptions".

B.37 DCM module changes

No substantial content changes.

B.38 Messaging Unit (MU)

B.38.1 Chip-specific MU information changes

No substantial content changes.

B.38.2 MU module changes

- Revised access type and reset value of CCR0[2].
- Revised access type and reset value of CCR0[4].
- Added note in MUA side and MUB side.
- Updated Asynchronous system reset.

B.39 Power Management changes

- Added a note in Software Standby mode entry sequence.
- In Operational power modes, revised the description of Standby mode.

- In Standby mode exit, added #2.
- Updated PMIC Handshake with MCU.
- In Software configuration phase, added more steps.
- Updated Hardware Standby mode entry sequence.

B.40 PMC changes

No substantial content changes.

B.41 Mode Entry Module (MC_ME)

B.41.1 Chip-specific MC_ME information changes

No substantial content changes.

B.41.2 MC_ME module changes

No substantial content changes.

B.42 MC_PCU changes

No substantial content changes.

B.43 Wakeup Unit (WKPU)

B.43.1 Chip-specific WKPU information changes

No substantial content changes.

B.43.2 WKPU module changes

No substantial content changes.

B.44 Chip-specific Safety overview information changes

No substantial content changes.

B.45 Error Injection Module (EIM)

B.45.1 Chip-specific EIM information changes

No substantial content changes.

B.45.2 EIM module changes

• Updated the first paragraph of Overview.
• Updated revision history title to "EIM module changes".

B.46 Error Reporting Module (ERM)

B.46.1 Chip-specific ERM information changes

• Added a footnote in Table 222.

B.46.2 ERM module changes

• In introductory text of "ERM register descriptions", added information related to the XFR error behavior at the IPS interface. • Added Figure 183.

B.47 Fault Collection and Control Unit (FCCU)

B.47.1 Chip-specific FCCU information changes

No substantial content changes.

B.47.2 FCCU module changes

No substantial content changes.

B.48 SELFTEST_GPR module changes

• Updated Progressive shift clock switching (PCS).

B.49 Self-Test Control Unit (STCU2)

B.49.1 Chip-specific STCU2 information changes

• In STCU2 LBIST/MBIST mapping, added mbist 0 mapping.

B.49.2 STCU2 module changes

• Updated the description of STCU2 SK Code (SKC).
• Removed topic "Use cases and limitations". • Revised FSM description, changed state machine to FSM.

- Revised Peripheral bus interface and Glossary.
- Revised description for CFG[PTR], CFG[CLK_CFG] , CFG[LB_DELAY] , LB_CTRL0[PTR], and MB_CTRLn[PTR].
- Revised description for MBSSWn and MBESWn.

B.50 Register Protection (REG_PROT)

B.50.1 Chip-specific REGPROT information changes

No substantial content changes.

B.50.2 REG_PROT module changes

- In GCR[HLB], added a note.

B.51 Clock Monitoring Unit – Frequency Check (CMU_FC)

B.51.1 Chip-specific CMU_FC information changes

No substantial content changes.

B.51.2 CMU_FC module changes

- Updated the Features.
- Updated the Operating modes.

B.52 Clock Monitoring Unit – Frequency Meter (CMU_FM)

B.52.1 Chip-specific CMU_FM information changes

No substantial content changes.

B.52.2 CMU_FM module changes

No substantial content changes.

B.53 Cyclic Redundancy Check (CRC)

B.53.1 Chip-specific CRC information changes

No substantial content changes.

B.53.2 CRC module changes

- Updated Clocking.

B.54 PCMC changes

- Updated "PLAT_AIPS_CLK" to "AIPS_PLAT_CLK" in Clocking.

B.55 Input Glitch Filter

B.55.1 Chip-specific Input Glitch Filter information changes

No substantial content changes.

B.55.2 Input Glitch Filter module changes

- Added a note in Block diagram.

B.56 Enhanced Flex Pulse Width Modulator (eFlexPWM)

B.56.1 Chip-specific eFlexPWM information changes

No substantial content changes.

B.56.2 eFlexPWM module changes

- Revised External signals, added "The maximum allowed external frequency should be less than the module clock frequency." in EXT_CLK.

B.57 Analog-to-Digital Converter (ADC)

B.57.1 Chip-specific ADC information changes

No substantial content changes.

B.57.2 ADC module changes

No substantial content changes.

B.58 SIGMA DELTA ANALOG TO DIGITAL CONVERTER (SDADC)

B.58.1 Chip-specific SDADC information changes

No substantial content changes.

B.58.2 SDADC changes

- Added CCR[CCR_B1_IPS_EN], CCR[OSR_HALF] and CCR[EN_CLK_RATE_HALF].
- Added 20 MHz sampling rate mode.

B.59 ADCBIST module changes

No substantial content changes.

B.60 FIR Filter

No substantial content changes.

B.61 Low Power Comparator (LPCMP)

B.61.1 Chip-specific LPCMP information changes

No substantial content changes.

B.61.2 LPCMP module changes

- Added Version ID (VERID) register.

B.62 Logic Control Unit (LCU)

B.62.1 Chip-specific LCU information changes

No substantial content changes.

B.62.2 LCU module

No substantial content changes.

B.63 Enhanced Modular IO Subsystem (eMIOS)

B.63.1 Chip-specific eMIOS information changes

No substantial content changes.

B.63.2 eMIOS module changes

No substantial content changes.

B.64 Body Cross-triggering Unit (BCTU)

B.64.1 Chip-specific BCTU information changes

No substantial content changes.

B.64.2 BCTU module changes

- Minor correction in figures of Trigger timing and Simultaneous trigger priority management.

- Updated Implementation.

B.65 Trigger MUX (TRGMUX)

B.65.1 Chip-specific TRGMUX information changes

No substantial content changes.

B.65.2 TRGMUX module changes

No substantial content changes.

B.66 CoolFlux DSP Subsystem (DSPSS)

B.66.1 Chip-specific CoolFlux information changes

- Added CoolFlux debug interface, CoolFlux Arm Cortex-M7 co-debugging, and Cross break interface sections.

B.66.2 DSPSS changes

No substantial content changes.

B.67 Enhanced Time Processing Unit (eTPU)

B.67.1 Chip-specific eTPU information changes

- Updated Device-specific features.

B.67.2 eTPU module changes

- Added sections Event in (EVTI) and Event out (EVTO).
- Added section Breakout EVTI/O.

B.68 Sine Wave Generator (SGEN)

B.68.1 Chip-specific SGEN information changes

No substantial content changes.

B.68.2 SGEN module changes

No substantial content changes.

B.69 Software Watchdog Timer (SWT)

B.69.1 Chip-specific SWT information changes

No substantial content changes.

B.69.2 SWT module changes

No substantial content changes.

B.70 System Timer Module (STM)

B.70.1 Chip-specific STM information changes

No substantial content changes.

B.70.2 STM module changes

No substantial content changes.

B.71 Periodic Interrupt Timer (PIT)

B.71.1 Chip-specific PIT information changes

No substantial content changes.

B.71.2 PIT module changes

- Moved Modes of operation under Functional description.
- Updated in the sub-sections of Functional description.
- Updated in Application information and its sub-sections.
- Updated the access row in "PIT memory map".
- Updated register function description in PIT Module Control (MCR).
- Updated description in RTI_LDVAL_STAT[RT_STAT].
- Updated description in RTI_TFLG[TIF].
- Added text "See LTMR64H and LTMR64L." in TCTRL0[CHN]."
- Updated description in TFLG0[TIF].

B.72 Real Time Clock (RTC)

B.72.1 Chip-specific RTC information changes

No substantial content changes.

B.72.2 RTC module changes

No substantial content changes.

B.73 Low Power Serial Peripheral Interface (LPSPI)

B.73.1 Chip-specific LPSPI information changes

No substantial content changes.

B.73.2 LPSPI module changes

No substantial content changes.

B.74 Low Power Inter-Integrated Circuit (LPI2C)

B.74.1 Chip-specific LPI2C information changes

No substantial content changes.

B.74.2 LPI2C module changes

- Updated MCFGR0[HRPOL] description.

B.75 Flexible I/O (FlexIO)

B.75.1 Chip-specific FlexIO information changes

No substantial content changes.

B.75.2 FLEXIO module changes

No substantial content changes.

B.76 CAN (FlexCAN)

B.76.1 Chip-specific FlexCAN information changes

- Added a note in FlexCAN instances and configuration.

B.76.2 FlexCAN module changes

No substantial content changes.

B.77 De-serial Serial Peripheral Interface (DSPI)

B.77.1 Chip-specific SPI information changes

- Added a note "Slave mode is not supported for DSPI" in DSPI instances and configuration.

B.77.2 DSPI module changes

No substantial content changes.

B.78 Ethernet Media Access Controller (EMAC)

B.78.1 Chip-specific EMAC information changes

- Added a note "QuadSPI cannot be used along with Ethernet in 176LQFP-EP" in EMAC instance and configuration.

B.78.2 ENET_Controller module changes

No substantial content changes.

B.79 Low Power Universal Asynchronous Receiver/Transmitter (LPUART)

B.79.1 Chip-specific LPUART information changes

No substantial content changes.

B.79.2 LPUART module changes

- Replaced the instance of "IrDA" with "infrared data association (IrDA)" in Overview section.
- Updated the following sections: Receiver functional description, Data sampling technique, Receiver wake-up operation.
- Replaced section title "Interrupts and status fields" with "Interrupts".

- Replaced reserved field access type "RW" with "ROZ" in bit 12 of Control (CTRL) register.

- Updated Baud rate generation section.

- Added Baud rate tolerance and Calculating baud rate tolerance.

- Replaced "receive data" with "Receive data (from RxD)" in Figure 594.
- Replaced 'sever to 10 bits' with 'along with N (7, 8, 9, 10) bits' in Receiver functional description.
- Replaced "When CTRL[LOOPS] is 1,..... (CTRL[RSRC] = 1)." with "Enable Loop mode.....CTRL[RSRC] = 0" in Loop mode.
- Replaced "When CTRL[LOOPS] is 1.....(CTRL[RSRC] = 1)" with "Enable single.....CTRL[RSRC] = 1" in Single-Wire mode.

- Replaced the word ‘DTS’ with ‘CTS’ in Hardware flow control.

- Changed the line ‘This is called resynchronization’ with ‘This Synchronization.....as Resynchronizarion’ in Data sampling technique.
- Updated Figure 597.
- Updated the long description of DATA[IDLINE].

B.80 Quad Serial Peripheral Interface (QuadSPI)

B.80.1 Chip-specific QuadSPI information changes

No substantial content changes.

B.80.2 QuadSPI module changes

- In MGC[GCLCK], bitfield description updated
- Bitfield description revised in TG*n*MDAD[LCK]

B.81 Zipwire changes

- Updated Chip-specific Zipwire information.

B.82 Serial Interprocessor Interface (SIPI)

B.82.1 Chip-specific SIPI information changes

No substantial content changes.

B.82.2 SIPI module changes

No substantial content changes.

B.83 LVDS Fast Asynchronous Serial Transmission (LFAST)

B.83.1 Chip-specific LFAST information changes

No substantial content changes.

B.83.2 LFAST module changes

No substantial content changes.

B.84 Debug changes

- Added a note in SDA_AP register descriptions.
- Added a note in CTI assignments.

B.85 JTAG Controller (JTAGC)

B.85.1 Chip-specific JTAGC information changes

No substantial content changes.

B.85.2 JTAGC module changes

No substantial content changes.

B.86 JDC module changes

No substantial content changes.

B.87 Temperature Sensor (TempSense)

B.87.1 Chip-specific TempSense information changes

- Added TempSense configuration.

B.87.2 TEMPSENSE module changes

- Updated Overview and Conversion from voltage to temperature

Legal information

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

Suitability for use in automotive applications (functional safety) — This NXP product has been qualified for use in automotive applications. It has been developed in accordance with ISO 26262, and has been ASIL classified accordingly. If this product is used by customer in the development of, or for incorporation into, products or services (a) used in safety critical applications or (b) in which failure could lead to death, personal injury, or severe physical or environmental damage (such products and services hereinafter referred to as "Critical Applications"), then customer makes the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, safety, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. As such, customer assumes all risk related to use of any products in Critical Applications and NXP and its suppliers shall not be liable for any such use by customer. Accordingly, customer will indemnify and hold NXP harmless from any claims, liabilities, damages and associated costs and expenses (including attorneys' fees) that NXP may incur related to customer's incorporation of any product in a Critical Application.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
